To those manufacturers who intend to make a serious bid for Overseas trade, we would emphasise the imperative necessity of making adequate arrangements for the holding of stocks of all spare parts at reasonable prices and at convenient centres in all Overseas countries.

We venture to suggest that if replacements of broken and worn parts of foreign machines had been as difficult and as costly to obtain as those of British motor cycles, the large increase in the use of foreign machines Overseas may not have taken place to the extent it has done.

It is futile to expect the Colonial rider to lay up his machine pending correspondence between the Colonial agents and the British manufacturer, which in the case of New Zealand would mean a minimum delay of three months.

Advantages British Manufacturers Should Offer.

The advantages which the British manufacturer must be prepared to offer are: First, a machine embodying all the chief requirements of the Overseas rider at a price equivalent to that of the foreign article; secondly, a guarantee that in the event of an accident necessitating replacement of any part of the machine, the buyer will be supplied from stock, actually in the country, with the necessary part at a reasonable cost; and, thirdly, the feeling that when a sale has been effected, the account is not closed, the manufacturer retaining a paternal interest in the machine supplied.

Assisting Overseas Trade.

Our offer to the British motor cycle industry is to do all in our power to assist them in their trade with the Overseas Dominions and foreign countries—the furtherance of which we look upon as a patriotic duty—by placing at their disposal, upon request, information we may possess concerning the possibilities of trade and peculiar conditions in any particular part of the world.

From our readers Overseas we welcome any particulars of the conditions relative to motor cycling, which assist us in fostering the most fascinating type of motor vehicle extant.

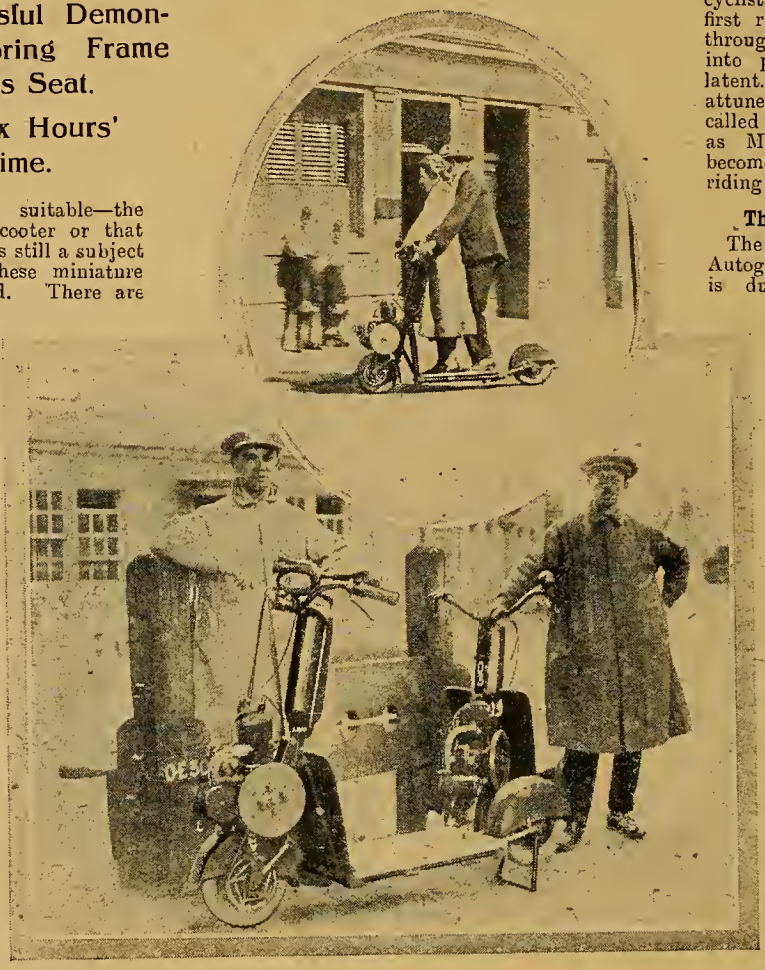
BIRMINGHAM TO LONDON BY SCOOTER.

A Highly Successful Demonstration of a Spring Frame Scooter minus Seat.

112 Miles in Six Hours' Running Time.

WHICH is the more suitable—the platform type of scooter or that fitted with a seat—is still a subject for argument whenever these miniature motor cycles are discussed. There are quite a number of people who, at present, prefer the idea of the platform, but so few scooters have been made and tried that the question is only decided on imagination by the bulk of the scooters' critics. It is therefore interesting to meet a scooter rider who claims to have ridden over 3,000 miles on a platform machine, and is convinced that the seat is not necessary. This rider is Mr. C. R. Townsend, the designer of the Autoglider illustrated on this page, and, since it would be simple to fit a comfortable seat, that he is not doing so is significant.

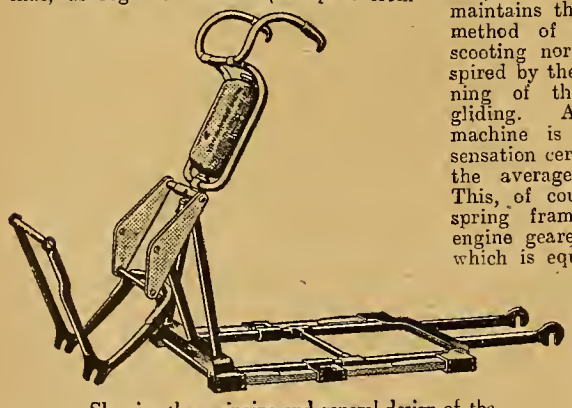
Most "stand up" scooters we have tried are not suitable for anything more than short-distance trips, and even after a mile we have experienced certain leg strains which, at the end of the run, suggested that it was easier to kneel than to stand.



(Top) Initiating a lady in the art of "autogliding."
(Bottom) The Autogliders posed near the stocks in Dunchurch.

Absence of Vibration.

The Autoglider is different, however. It has an efficient spring frame, and a short test of its running revealed that road vibration was to a very large extent minimised, and it would therefore appear that, as regards comfort (as apart from the question of popularity), the answer to the query "to stand, or not to stand?" may depend largely upon the design of the scooter.



Showing the springing and general design of the Autoglider frame.

We raised this point with Mr. Townsend, but the designer of the Autoglider maintains that his machine opens a new method of transport which is neither scooting nor motor cycling—an idea inspired by the smooth and high speed running of the machine which suggests gliding. At high speeds—and this machine is capable of 30 m.p.h.—the sensation certainly is different from riding the average motor cycle or scooting. This, of course, is due to the resilient spring frame, and a smooth running engine geared 4 to 1 with 12in. wheels, which is equal to 8 to 1 with the 24in. wheels of a lightweight.

Mr. Townsend agrees that at first one experiences a certain stiffness after the initial rides on this machine, but maintains that this only approximates to that which is suffered by cyclists and oarsmen after their first ride or spell at the oars, through muscles being brought into play which normally are latent. Once these muscles are attuned to the work they are called upon to do, autogliding—as Mr. Townsend terms it—becomes less fatiguing than riding a bicycle or walking.

The Frame Construction.

The smooth running of the Autoglider, as before mentioned, is due to its spring frame and platform, but the machine would be robbed of this comfort were it not fitted with a smooth running engine and its slipping clutch shock absorber.

The illustration shows the design and construction of the Autoglider sufficiently to render a lengthy description unnecessary. It will be seen from the drawing that the frame is rectangular, and is pivoted at its four corners in brackets forming part of the front and rear fork members. Four laminated leaf springs are carried from this point, and slide in a box approximately in the middle of the frame. Two heel-operated band brakes are fitted on the rear wheel.

A 2¾ h.p. Union two-stroke will, we understand, be adopted, and the price has been provisionally fixed at forty guineas.

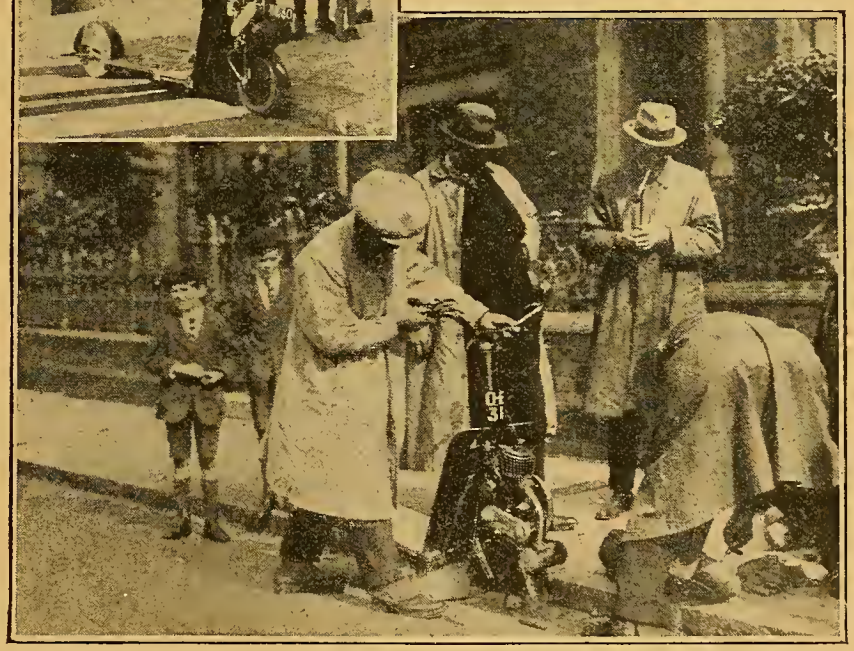
A Long-distance Trial.

In order to prove his contentions, the maker arranged a prolonged run on Thursday, the 21st inst. Meeting at the works in Great Charles Street, Birmingham, a commencement was made, London being the objective.

Two Autogliders started, one, of the latest type, with Union two-stroke engine, being driven by Mr. Skinner, works manager of Messrs. Townsend and Co. Mr. Skinner's task was to demonstrate the possibility of a rider covering 100 miles without undue fatigue, and so prove the redundancy of the saddle. The other machine was an early demonstration model, with over 3,000 miles to its credit, and was taken along so that any of the pressmen, who followed in Mr. Townsend's car, could sample and delights of autogliding.

Leaving Birmingham at 9.40 a.m., the party headed for Coventry, and, on the rough surface of Meriden Hill, near the latter place, it was quite impressive to notice the efficient manner in which the springing of the frame was operating.

Hereabout, the companion "hack" machine began to shed the rubber off its driving tyre, which had recently been



(Top) The two Townsend Autogliders waiting to commence their journey from Birmingham to London. Mr. Skinner (in white coat) covered a distance of 120 miles in running time of six hours
(Centre) In North London; refilling the tank of the Autoglider with petroil mixture.
(Bottom) Changing the front cover on the old demonstration model on which members of the party sampled the art of gliding.

retreaded, and a stop was made to replace the cover with a new Palmer cord. During the tyre-changing operations, which took exactly twenty-five minutes, the test machine was demonstrated to us and ridden by Mr. Stafford, another seatless scooter manufacturer, outside whose works, by a curious coincidence, the *contretemps* occurred.

It was distinctly illuminating to hear the views of these exponents of the platform machine. Both, of course, champion the stand-up position, advancing, as arguments, that the unavoidable vibration resulting from the short wheelbase and small diameter wheels, even when minimised by such a complete system of frame springing as that of the Autoglider, is transmitted directly to the base of the spine when a seat is provided. When standing on a platform, the vibration, it is urged, is not felt, since it is absorbed by the natural spring and poise of the rider's body and legs. Incidentally, the point of any vehicle least affected by road vibrations is at its centre, and, in the machine under test, the rider stands midway upon the platform.

35 m.p.h. Attained.

Having refitted the wheel, fast time was made through Coventry to Towcester; in many places a steady 25 to 30 m.p.h. was maintained, and, on one particular stretch, the speedometer needle of the car, which followed the two scooters at a distance of about a hundred yards, remained for three miles on the 35 m.p.h. mark.

After Towcester the writer took over the companion machine, and rode alongside Mr. Skinner, who was going well, having had no involuntary stops, and, with half the journey covered, still appeared to be perfectly fresh.

This is quite the fastest glider we have sampled (the engine is a 2½ h.p. Villiers two-stroke), but the management was found to be perfectly simple, steering and steadiness at speed being quite as good as experienced on a solo motor cycle.

Running down through Barnet we paused in the Finchley Road to fill up, and then made the crossing of London quite easily, having only one traffic stop in Farringdon Road. A crowd at once assembled in Tudor Street as the machines arrived outside the offices of *The Motor Cycle*, and the cleanly appearance was favourably noticed.

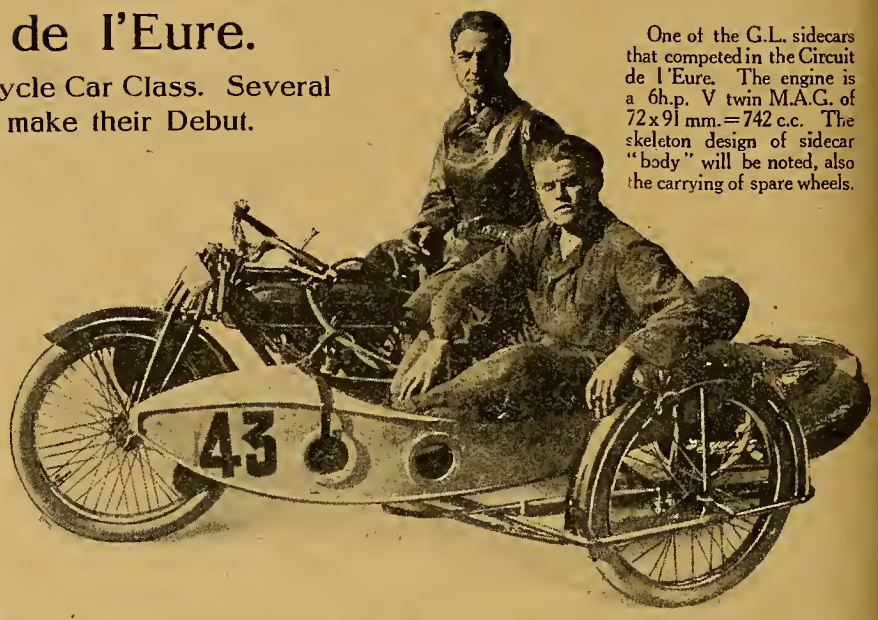
The Rider Quite Fresh.

Mr. Skinner, who had "glided" the whole distance from Birmingham, was remarkably fresh and fit, and, despite his long standing, protested that he was not tired. It is a fact that, throughout the whole run, he had experienced no phyiscal inconvenience other than that caused by lack of goggles. His miniature mount ran faultlessly throughout, without any mechanical stop. The distance covered by the accompanying car (by trip recorder) was 112 miles, but the additional demonstration runs on the way would easily bring the day's mileage of the glider up to 120. A little over a gallon of spirit was used on the "observed" machine.

This average of 20 m.p.h. compares with a lightweight motor cycle performance, as, of course, it should do if one considers the fact that a proved lightweight two-stroke engine of 70 × 70 mm. was fitted. But the fact of such a journey being possible of successful accomplishment, and the machine moreover able to finish in excellent mechanical condition, must be ascribed to the excellence of the springing system adopted. With larger wheels (it is proposed to replace the 12in. wheels by wheels of 16in. diameter), the Autoglider will be much improved both in comfort and by increasing the ground clearance. As it is, Mr. Townsend can be congratulated upon having made the most convincing demonstration of a scooter up to date.

The Circuit de l'Eure.

A British Success in the Cycle Car Class. Several New French Models make their Debut.



One of the G.L. sidecars that competed in the Circuit de l'Eure. The engine is a 6h.p. V twin M.A.G. of 72 x 91 mm. = 742 c.c. The skeleton design of sidecar "body" will be noted, also the carrying of spare wheels.

PROBABLY what is the nearest French approach to our Tourist Trophy Race was held on a course in the Eure district of France on the 15th and 16th inst.

There were classes for motor bicycles with engines not exceeding 250 c.c., 350 c.c., and 500 c.c., and for sidecars with engines not exceeding 500 c.c. The cycle car class was confined to engines of 1,100 c.c.

The event was divided into a two-days race, the sidecar and cycle car classes competing over a distance of 178¾ miles on the 15th inst., and the bicycles 223½ miles on the 16th inst.

All machines were sealed on the cylinders, frame, hubs, steering head, and change speed gear box, and competitors had to bring their machines to the weighing scale with the wires already fixed, for receiving the lead seals. Every machine had to carry a large circular number plate, on both sides of the machine attached either to the front or rear forks, and a similar number plate with smaller figures in front fastened to the girder tubes of the fork.

A Hilly Course.

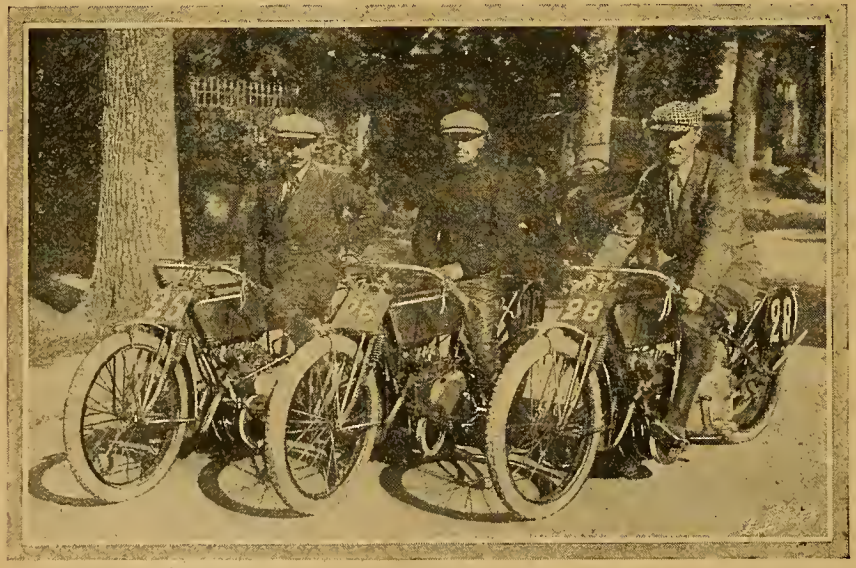
The course, which was a hilly one, started from near Vernon and travelled in an easterly direction towards Paris, through Gasny, Bionval, Valcorbon, and Herbécourt, to the finish near Vernon.

Among the machines that took part may be mentioned the G.L. sidecar. Four outfits of this make took part in the 750 c.c. sidecar class, only one British machine, a Rover, being pitted against this formidable team. The G.L. is a twin-cylinder machine, fitted with a M.A.G. engine. Two spare wheels were carried at the back of the racy-looking sidecar. Details of this model were given last week.

New French Design.

The Peugeot team were mounted on machines with side-by-side vertical twin-cylinder engines, chain driven, change speed gears, kick starters, Druid type spring forks, and outside flywheels. Two separate exhaust pipes were carried forward to one silencer. The engine had four overhead valves to each cylinder, these being inclined, and operated by overhead camshafts rotating in dust-proof casings, and specially lubricated.

Th Motosacoche machines, which have been greatly improved in general design, had overhead valve M.A.G. engines, all chain transmission gears, and Druid type spring forks.



The Peugeot team in the 500 c.c. class, Péan, Perrin and Desvaux. The engine is a vertical twin, with side by side cylinders having four overhead valves per cylinder and outside flywheel. The transmission is all chain, and the front forks of Druid pattern.

The Results.

The results of the sidecar and cycle car class are :

SIDECARS WITH ENGINES NOT EXCEEDING 750 c.c.
DISTANCE, 178¾ MILES.

	H.	M.	S.
1. Huret (G.L.)	5	16	34⅕
2. Le Pen (G.L.)	5	37	20
3. Delabre (Rover)	5	52	58

Winner's average speed 54.58 km. = 33.9 m.p.h.

SIDECARS WITH ENGINES NOT EXCEEDING 1,000 c.c.

	H.	M.	S.
1. Milliman (Harley-Davidson)	6	23	56
2. Oblin (Enfield)	6	35	53⅖

Winner's average speed 45 km. = 27.9 m.p.h.

CYCLE CARS.

	H.	M.	S.
1. P. Houel (Morgan M.A.G.)	5	10	23⅗
2. Enders Jack (Enders-Jack)	5	24	15⅗

Winner's average speed 55.67 km. = 34.5 m.p.h.

Two or three other Morgans competed, and Delabre's Rover made the fastest lap, 22m. 10s., 65 km. = 40.3 m.p.h.

The Second Day's Race.

On the 16th the motor cycle classes resulted as follow :

ENGINES NOT EXCEEDING 250 c.c.
DISTANCE, 178.8 MILES.

	H.	M.	S.
1. Louis (Alcyon)	6	9	40

Winner's average speed, 46.74 km. = 29.02 m.p.h.

ENGINES NOT EXCEEDING 350 c.c.
DISTANCE, 223½ MILES.

	H.	M.	S.
1. Milland (Motosacoche) ...	5	28	59⅗
2. Vulliamy (Alcyon) ...	5	33	18
3. Joly (Alcyon)	5	38	34

Winner's average speed, 65.6 km. = 40.6 m.p.h.

ENGINES NOT EXCEEDING 500 c.c.

	H.	M.	S.
1. Péan (Peugeot)	5	35	50⅗
2. Perrin (Peugeot)	5	49	3⅗

Winner's average speed, 40 m.p.h.

Sept.	1st	... ...	8.46 ,,
,,	3rd	... ...	8.41 ,,

Dumping.

The Government is to prevent "dumping." Mr. Lloyd George said in the House of Commons last week that proposals would be submitted to stop imports of goods at prices lower than the prices at which they were sold in the country of their origin.

Second-hand Motor Cycles.

Manufacturers say it is very difficult to stop profiteering in new motor cycles. They cannot control second-hand prices of machines, which have been turned into "second-hand" after an hour's running on the road, and it is the price of these machines that sets the standard.

Lakeland Motor Road Refused.

The proposed new road suitable for motor traffic over Sty Head Pass in the Lake District is not to mature, as the scheme for its construction has been turned down by the Cumberland County Council on a vote of thirty against eleven.

A sum amounting to nearly £10,000 was allotted to the furtherance of this project by the Musgrave will, and as the construction was to have been commenced within two years, there is every prospect of the time limit being exceeded, and in consequence the money will revert to members of the testator's family.

The Prime Minister on Imports.

The 33⅓% import duty on motor cycles is *not* to be removed on September 1st, as some people imagine, but only the war-time restrictions.

Motor Cycle Prices in South Africa.

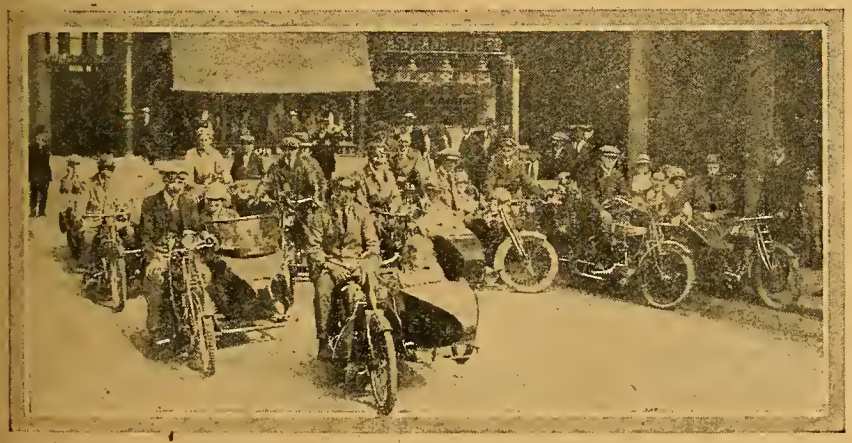
High prices for motor cycles are ruling in South Africa at the present time. The Municipal Council of Johannesburg recently invited tenders for a combination, and was quoted £148 4s. for a B.S.A. and sidecar, and £164 for a Triumph with cane sidecar. If these figures were for new machines the difference between prices in South Africa and England is not so great as might have been expected.

Cylinders.

How many years will elapse before the one-piece cast iron cylinder will be obsolete on motor cycles?

A Cool Request.

In these days of reliability one does not see many motor cyclists who have difficulty in starting. We saw a lightweight owner the other day with a girl on the carrier who had enlisted the sympathy of a passer-by to give him a start. The pusher was stout, and the temperature about 80° in the shade, and he was requested to push machine, rider, and passenger until the engine fired. We watched them out of sight round a corner and forgot all about them. Soon after the trio returned, and we were astonished at the coolness of the rider, who, turning to the stout pusher, said, "You want to give it a good, long, strong push and *run;* it won't start at walking speed!"



Members of the Reading and District Motor Cycle Club at the start of their club run to Newlands Corner last week Among the machines assembled are Scott, B.S.A., Norton. Rudge, and Bat

Special Features.

LOW-POWERED SIDECAR TOURING.
A FRENCH T.T.
OVERSEAS SECTION.

For Meritorious Service.

Mr. "Jack" Healy, who rode a B.S.A. in the 1914 T.T. (finishing 19th), has been awarded the Meritorious Service Medal. He joined up as a despatch rider in 1914.

Major Walter Hyde (son of Mr. C. A. Hyde of the B.S.A. Company) has been appointed to take charge of all commercial and technical matters of the B.S.A. motor cycles. No doubt the energy and initiative which his fine war record shows will prove of great value to the company

Police Traps.

A police trap is in operation on Half Moon Lane between Hune Hill and Dulwich; cut-outs and number plates are examined.

We are informed that a police trap is working in the ten-mile limit through Deganwy village, near Llandudno, and another, where brakes are examined, between Warrington and Wigan.

An Absence of Signposts.

A rider who has just visited the Isle of Wight informs us that on landing he was struck by the almost complete absence of signposts. On reaching Ryde there is no direction post showing the way to Sandown, Shanklin, or Ventnor until the outskirts of the town are reached, right on the top of a hill. We sincerely hope that the motoring institutions will take notice of this deficiency.

M.C.C. Team Trial.

The latest addition to the list of teams entered for the M.C.C. Team Trial for *The Motor Cycle* cup is that which will represent the Ilkley and District M.C.C.

Postponed Trials.

The wavering of the Manufacturers' Union on the subject of supporting competitions was the cause of the lack of entries and consequent abandonment of the South Birmingham M.C.C. open trial for the Palmer cup on the 16th inst. The Essex Club's two days run to York and back, which was to have taken place last Saturday and Sunday, was also abandoned.

Police Trap.

On the London-Southend road, just before entering Leigh-on-Sea, a police trap is in operation, but, we believe, only over the week-ends.

Motor Cycle v. Aeroplane and Car.

E. Kickham, who is to ride a 2¾ h.p. Douglas in the Bristol M.C. speed trials at Weston-super-Mare on Saturday, will be matched against A. H. R. Fedden (15 h.p. Straker-Squire) and Capt. A. N. Appleford (110 h.p. Le Rhone Avro). The course will be a mile in length, and a cup is being presented by the Hutchinson Tyre Co.

British Excelsior Developments.

Coventry is to lose one of its manufacturers of motor cycles. Messrs. Bayliss, Thomas and Co. (Excelsior Motor Co., Ltd.) are moving to Tyseley, Birmingham. Having manufacturing interests in Birmingham with space to extend, the makers of the British Excelsior decided to utilise this land and works for the manufacture of their motor cycles, and, with the facilities available, it is expected that an output of 100 motor cycles will be possible within the next three months. Mr. W. H Carson, who has been connected with the firm for so long, and who has done so much to demonstrate the capabilities of the machines in sensational hill-climbing expeditions and reliability trials, continues as general business manager. From September 1st, the address of the company will be Excelsior Works, King's Road, Tyseley, Birmingham.

R. H. Lochhead, 3¾ Scott, one of the gold medallists in the Glasgow M.C.C. Trial last week end (see page 237).

IMPORTANT DATES.

A.C.U. Six Days Trial,	Sept. 15th to 20th.
Paris Salon - -	Oct. 9th to 19th.
Olympia Car Show.	Nov. 7th to 15th.
Olympia Motor Cycle Show,	Nov. 24th to 29th.
Brussels Show -	Dec. 8th to 13th.

Novel Consumption Test.

The Ealing and District M.C.C. held a petrol consumption test recently, when some remarkable figures were credited to the winners. Since each machine had a graduated glass tube on the tank, designed by Dr. Low, the performances should admit of no doubt. The distance traversed, however, was too short to enable figures to be given, which form a real guide to the comparative consumptions of various machines.

The star performance of the day was credited to a Wooler flat twin, which, although rated at only 2¾ h.p., is extremely efficient, and by skilful designing of the inlet pipe, etc., blow-back is very well prevented and great economy obtained.

Some of the best figures are given herewith :

Mr. Chidley (2¾ Wooler)	..	311 m.p.g.
Mr. Douglas (3½ Sunbeam sc.)..		162 „
Mr. Hudson (4 Triumph)	..	146 „

American Three Flag Record.

The "Three Flag" record from Canada to Mexico for the third time this year has been broken, this time by Wells Bennett on an Excelsior, who covered the 1,716 miles in 53h. 28m., an average speed of 32.09 m.p.h. The history of this American "classic" is as follows :

Aug. 24-27, 1915.—E. G. Baker (Indian), 81h. 15m.
July 17-20, 1917.—Roy Artley (Henderson), 72h. 25m.
Aug. 23-26, 1918.—Wells Bennett (Excelsior), 70h.
June 18-21, 1919.—H. C. Sherer (Harley-Davidson flat twin), 64h. 58m.
July 9-11, 1919.—G. G. Baker (Indian), 59h. 47m.
July 23-25, 1919.—Wells Bennett (Excelsior), 53h. 28m.

A.C.U. Six Days' Trial Entrants.

TO the lists of entries for the Auto Cycle Union Six Days Reliability Trial, September 15th to 20th, we are now able to add the following :

E. W. Choldcroft (A.J.S.)
V. Horsman (Norton)
H. P. B. Motor Co.—P. J. H. Plase (Dot-Jap)
H. F. S. Morgan (Morgan)
J. Marston, Ltd.—G. Dance (Sunbeam), J. Dudley (Sunbeam), and De la Haye (Sunbeam)
G. B. Hardee (Matchless)
J. A. Newman (Sunbeam)
R. H. Baxter (Radco)
Rex Mundy (——)
New Rover Cycle Co.—W. Danskin (Rover), D. H. Noble (Rover), and C. Featherstonhaugh (Rover)
Lt. Lauri de Aranzo (Harley-Davidson)
F. S. Jones (——)
Dot Motors, Ltd.—H. Reed (Dot)
F. C. Townshend (Sunbeam)
J. A. Watson-Bourne (Blackburne)
Triumph Cycle Co., Ltd.—Three machines
Capt. Lindsay (Norton)
P. Pike (Levis)
F. C. McClasham (Matchless)
T. B. G. Vale (Ariel)
R. C. Davies (Chater-Lea)
W. A. Fell Smith (Harley-Davidson)
B.S.A. Cycles, Ltd.—P. Turbey, jun. (B.S.A.), W. J. Chambers (B.S.A.), H. T. Edwards (B.S.A.), L. L. Sealey (B.S.A.), F. W. Applebee (B.S.A.), and A. E. Wood (B.S.A.)
Zenith Motors.—H. Jepson (Zenith) and S. Bourne (Zenith)
S. W. James (Morgan)
W. R. Hoggas (New Imperial)
J. Baker (Scott)
J. A. Hoult (Matchless)
C. Collins (A.J.S.)
H. Greaves (Morgan)
James Cycle Co.—J. Lidstone (James), G. A. Strange (James), G. S. Stobart (James), and T. Stevens (James)
A. V. Sumner (Zenith)
V. Kershaw (Verus)
Scott Engineering Co.—W. Leslie, C. T. Wood, and H. C. Wood
A. Don (Zenith)
Lt. B. Alan Hill (Scott)
H. Pattinson (Triumph)
S. Sawer (Morgan)
C. R. Collier (Matchless)
Phelon and Moore, Ltd.—W. Drake (P. and M.), C. S. Chidley (P. and M.), and R. Lewis (P. and M.)
A.B.C. Motors.—H. Fairley and J. Emerson
Eric Williams (A.J.S.)
Enfield Cycle Co.—D. Alexander (Enfield)
A. J. Stevens, Ltd.—S. W. Giles (A.J.S.) and H. C. Heath (A.J.S.)
W. J. Baker (Henderson)
Ariel Works, Ltd.—J. L. Stocks (Ariel)
T. Peck (Ariel)
C. W. Smith (Ariel)
Clyno Engineering Co.—Hugh Gibson (Clyno)
J. W. Phillips (Sunbeam)
Vivian Hardie and Lane.—F. Thorpe (G.L.) and G. Levey (G.L.)
P. J. Enticknapp (Blackburne)
J. S. Holroyd (Blackburne)
Veloce, Ltd.—D. S. Goodman (Veloce)
J. W. Wills (——)
New Imperial Cycles.—Two machines
Oswald Wade (A.J.S.)

Entries close (at double fees) on Saturday next, the 30th.

Reading and District M.C. and L.C.C.

Members of the Reading club recently had an enjoyable run to Wisley Hut and Newland's Corner, and hope that on the next outing, to Kop Hill, on August 31st, all local motorists interested will join them at the start from Cork Street, Reading, at 10.30 a.m.

Wolverhampton M.C.C.

The Wolverhampton Motor Cycling Club holds its inter-club reliability trial on Saturday next, this being open to members of the Wolverhampton, Birmingham, Coventry and Warwickshire, Sutton Coldfield, and Hereford clubs. Hill-climbing, brake, and acceleration tests will be included.

N.M.C.F.U. (Wolverhampton).

All members of the Wolverhampton branch of the N.M.C.F.U. are requested to join in the paperchase to be held on Saturday. The entrance fee is only sixpence, and prizes, in the form of useful accessories, will be awarded; the secretary is Mr. W. J. Saunders, 223, Dunstall Road, Wolverhampton.

Open Hill-climb at Sutton Bank.

The York and District M.C. will hold an open hill-climb at Sutton Bank on Saturday, September 6th. This event is one of those supported by the Motor Cycle Manufacturers' Union, and classes for motor cycles, sidecars, cycle cars, and scooters will be included. Entries close on Saturday, August 30th, and forms may be had from the hon. sec., Mr. G. A. Reed, 6, Blake Street, York.

The Junior Car Club.

The above club holds its annual general efficiency trial on Saturday, September 6th, 1919, and classes are arranged for monocars, cycle cars, and light cars. The tests consist of a sixty mile reliability trial, an acceleration test at the start, a timed hill-climb, stopping and restarting tests, and a secret test. Full particulars may be obtained from the hon. organising secretary, Mr. G. N. Higgs, 30, Prince of Wales's Mansions, London, S.W.11.

Aberdare and District M.C.C.

A hill-climb on novel lines was recently held amongst members of the Aberdare M.C.C. This took place on the Graig Mountain road, and six or seven hundred spectators were present. The first 150 yards had to be covered as slowly as possible, and the remainder of the climb (almost a mile) was taken fast. Owing to war conditions, the road has been neglected, and, on the 1 in 7 corners, the surface was very loose and dusty The results on formula are not yet worked out.

Future Events.

Aug. 28.—Stalybridge and District M.C. General Meeting at 7.30.
AUG. 30.—WOLVERHAMPTON M.C.C. OPEN RELIABILITY TRIAL.
Aug. 30.—S. Birmingham M.C.C. Hill-climb.
Aug. 30.—N.M.C.F.U., Sheffield. Week-end Run to Boston.
Aug. 30.—N.M.C.F.U., Portsmouth. Run to Halnaker.
AUG. 30.—BRISTOL M.C. SPEED TRIALS AT WESTON-SUPER-MARE.
Aug. 30.—Public Schools M.C.C. Hill-climb.
Aug. 30.—Wolverhampton M.C.C. Inter-club Reliability Trial.
Aug. 30.—N.M.C.F.U. (Wolverhampton). Paperchase.
Aug. 31.—N.M.C.F.U., Leeds. Soldiers' Outing.
Aug. 31.—Ilkeston and District M.C.C. Run to Matlock.
Aug. 31.—N.M.C.F.U., Portsmouth. Run to Hayling Island.
Aug. 31.—Stalybridge and District M.C. Run to Rhyl.
Aug. 31.—Birmingham M.C.C. Social Run.
Aug. 31.—Rochester, Chatham, and District M.C. Run to Hawkhurst.
Aug. 31.—Woolwich, Plumstead, and District M.C. Picnic and Gymkhana at Brasted Hill.
Aug. 31.—Reading and District M.C. and L.C.C. Run to Kop Hill.
Aug. 31.—Eastern Counties M.C. Run to Thaxted.
Sept. 4.—Carmarthen M.C. and C.C.C. Speed Trials at Pendine Sands.
Sept. 6.—Junior Car Club. General Efficiency Trial.
SEPT. 6.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
SEPT. 6.—YORK AND DISTRICT M.C. OPEN HILL-CLIMB AT SUTTON BANK.
Sept. 13.—N.M.C.F.U. (Wolverhampton). Run to Rudyard Lake.
Sept. 13.—Lincolnshire A.C. Hill-climb.
Sept. 13.—Luton and S. Beds. A.C. Open Speed Trials at Luton Hoo.
Sept. 14.—Manchester M.C. Speed Trials.
SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.
Sept. 19.—Essex M.C. Gymkhana.
Sept. 20.—Blackburn and District M.C.C. Hill-climb on Waddington Fells.
Sept. 27.—Coventry and Warwickshire M.C. Hill-climb.
Sept. 27.—Wolverhampton M.C.C. Open Hill-climb.
Sept. 28.—N.M.C.F.U. (Wolverhampton). Run to Crackley Bank, Wellington.
Sept. 28.—Manchester M.C. Closing Run.
Oct. 4.—Essex M.C. Hill-climb.

Middlesex M.C.C.

The Middlesex Club recently held a very successful evening at the Great Eastern Hotel, and it was decided that no entrance fee should be required of new members. The subscription is 15s. per annum, and motor cyclists joining now will be entitled to membership until the end of the 1920 season. A team is being entered in the M.C.C. Trial for *The Motor Cycle* Cup.

Essex M.C.

The annual outing for crippled children, organised by the above club, will be arranged some time in September. The organiser, Mr. E. J. Bass, 18, Market Square, Bishop's Stortford, will be glad to have the loan of vehicles for the journey, to Epping Forest, or to receive subscriptions to defray the cost.

A hill-climb is being organised by the Essex M.C., and the venue and full particulars will be announced at a later date.

Public Schools M.C.C.

On Saturday, the above club will meet at Purley Corner at 2 p.m. for a fifty mile non-stop competition, including brake and acceleration tests.

Sangster Cup Trial Postponed.

The secretary of the Birmingham M.C.C. advises us that the Sangster cup reliability trial has been postponed owing to its clashing with the inter-team trial for *The Motor Cycle* cup on Sept. 6th.

Open Speed Trials at Luton.

On September 13th the Luton and South Bedfordshire Automobile Club will again hold its open speed trials in Luton Hoo Park, Luton, commencing at one o'clock. The course is over a kilometre (flying start), and there are ten classes for motor cycles, scooters, sidecars, and three-wheelers.

Admission to the park will cost 2s. 6d., and the whole amount thus taken will be handed to a charity nominated by Lady Wernher, by whose kind permission the event is being held in the park.

Entries cannot be received later than Wednesday, September 3rd. The address of the secretary, Mr. J. Simpson, is 440, Hitchin Road, Luton.

Hull and East Riding M.C. and L.C.C.

The members of the Hull and East Riding Motor Cycle and Light Car Club were recently invited to a rally at the residence of its vice-president, Major A. J. Atkinson, who is an enthusiastic motorist of long standing. His garage contains a collection of pictures of motors he has used, and forms an almost complete history of automobilism, and he was induced to give a short lecture thereon. Tea was provided by the host and hostess, and afterwards a gymkhana was held and several handsome prizes, including a cup for the smartest outfit, were given by Major Atkinson, to whom the club members express their gratitude.

Carmarthen M.C. and C.C.C.

The above club recently held a successful hill climb, the results of which are as follow:

Class 1.—Up to 350 c.c.: J. Haggard (2½ Union two-stroke). Class 2.—Up to 557 c.c.: Dr. Lindsay (3½ Norton). Class 3.—Unlimited sidecars: A. Lewis (5 Rover sc.) Class 4.—Cycle cars: J. O. Smith (8 Morgan). Fastest time of the day, Dr. Lindsay (3½ Norton).

This club intends holding a series of speed trials on Pendine Sands on September 4th. The classes will include 350 c.c. and 557 c.c. solos and sidecars. Visitors may become members for the the purpose of competing on payment of 2s. 6d. Entries will be received up to the day of the event.

A Well-organised One Day Trial.

Redditch and District M.C.C. Open Reliability Run over a Stiff Course. Some New Hills Included.

THE committee of the Redditch and District M.C.C. is indeed fortunate in having at its service such an excellent band of helpers as those who assisted in the organisation and running of the 150-mile reliability trial on Saturday. The arrangements were carried out without a hitch, and at every hill there was no lack of marshals and observers, so that every competitor had the knowledge that his efforts would not be thrown away through confusion or misunderstanding.

Starting from Church Street, Redditch, the first man got away promptly at 8 a.m., and, taking the Alvechurch Road in a few miles, was switched into a grassy lane, which deteriorated on rounding a right-angle bend into a track of loose stones and shingle on a fairly steep grade. This was Gravel Pit Lane, Rowney Green, and coming early in the run, before the riders had got into the swing of things, it caused a little trouble, though not actually a severe gradient. B. Kershaw on a 2½ Verus came up very steadily, and Dosher (8 Enfield sc.) picked a winding course. The spectators at the top were scattered by W. E. Smith (4 Triumph), who evidently knew the hill, for he rode from one side to the other, following the grassy footpath at the edge. The little Enfield two-strokes were running very well, and S. Bright made a remarkably steady climb, whereas Southwell, on a "Big Four" Norton, dashed up much too fast and skidded right round, finishing up in the bushes at the side.

H. L. Hanks, 2¼ Enfield two-stroke and L. Southwell, 4¼ Norton, in the stopping and starting test on Saintsbury Hill.

Brown (3½ Sunbeam sc.) came up well, but in very theatrical manner, bouncing on the saddle like one possessed; his sidecar was a very light affair, and the lady passenger gave much assistance in throwing weight on the back wheel when needed.

W. N. Bowkett (3½ Sunbeam) appeared to be nervous, as, although he did not actually use his feet, he was continually putting out first one foot and then the other; his mount was fitted with a spring frame.

Passing through Bidford and Wixford into the Broadway district, a stopping and restarting test was held on Saintsbury.

The smaller machines, of course, did not make such clean restarts as the heavyweights. Bright (2¼ Enfield) had to use his feet, and H. Greaves, on the new 350 c.c. Calthorpe-Precision two-stroke, although making an excellent restart with such a small engine, had to give a little foot assistance.

Descending from the top of Saintsbury by way of Willersey Hill, the brake test was reached. This was a practical trial of braking power under conditions such as would occur in actual touring.

The competitors were stopped some little distance away from the observer and instructed to engage high gear and release brakes; they then ran down the hill a matter of fifty yards and were signalled to stop, the performance being judged by their ability to pull up within a ten-yard space marked on the road.

Dudley (3½ Sunbeam sc.), W. Jackson (6 L.M.C.), and Minton (4¼ Norton) were all very smart in pulling up, and the inevitable Denley brought his well-known Morgan to a standstill in an exceptional manner. The brake of H. L. Hanks's 2¼ Enfield gave a shriek and clatter as though the machine would fall to pieces, but nothing serious happened and he stopped quite well.

Better going followed from Broadway through Winchcomb to Cheltenham, but, beyond the latter, *détour* was made to reach Upton St. Leonards, in order to climb Portway.

Eagle Hill, turning abruptly off the main road, was the last acclivity, after which the time check was entered, and

R. C. Atcherley, 4 Triumph, and T. H. Weaver, 2¼ Verus, on Willersey during the brake test.

The lunch check at Stroud.

the lunch stop at Stroud for the time being put an end to the competitors' troubles. Only four men failed to check in at the lunch stop.

Terrible rumours were floating around as to the terrors of the new hill which had been included, and it proved to be quite up to its reputation.

Commencing at Brimscombe, with a right angle bend off the main Stroud-Cirencester Road, it is known as Quarhouse Lane, and has a gradually increasing gradient, and another right angle bend, crossed by a step or ridge of stones; the rise here is quite 1 in 3. A little easier stretch follows, then, sharply to the left, the riders were confronted by a narrow defile ascending the hillside with a gradient of about 1 in 5 for about 200 yards. There was some doubt as to the ability of the Morgans to get through this passage, so narrow was it.

Poole (4¼ B.S.A.) came up well, but his handle-bars became loose and he had to stop.

Bicknell on one of the 8 Enfield sidecars (which were fitted with extra large sprockets to obtain low gears) made a fine recovery, and H. Boynton (5-6 James sc.) likewise all but came over and righted the machine adroitly. W. E. Smith (4 Triumph) came up quite fast, hit the projecting stones, and jumped in the air; and Southwell also came up at speed, making frantic jabs at the gear lever of his Norton; he ended on the bank, and would no doubt have made a better climb had he cut down the pace. B. Brown on the yellow disc-wheeled Sunbeam sidecar came up beautifully, the severity of the climb not leaving him an opportunity for the customary heroics which otherwise rather minimise his excellent performance.

Greaves brought up the Calthorpe two-stroke very steadily, and H. R. Lane (4¼ B.S.A.) took the corner well. Bowkett (Sunbeam) had to use his feet, and was apparently unhappy. R. C. Atcherley probably made the finest ascent of the day, riding at a moderate pace, picking his way, and keeping his Triumph engine turning over with a splendid beat. Nicholls, driving a B.S.A. sidecar, is something of a demon driver, and invariably scatters the spectators—he kept up an appalling pace, but displayed excellent judgment. To drive a machine up a road of this description with a flat front tyre is a feat of no mean order, and this was done by F. W. Giles (6 A.J.S. sc.), who simply wrenched his outfit round.

Denley and Alan Hill (on Morgans) both came round steadily and with great skill, but the latter unfortunately failed on the next climb, Nap Hill, near Bussage, which followed almost immediately after Quarhouse. Mundy also failed here through wheel slip.

Good running followed these stiff tests, and Birdlip, the main road hill, caused no trouble, although Dosher (8 Enfield sc.) only just succeeded in surmounting the crest.

Through Alcester a roundabout route was taken so as to include the watersplash on the Beoley Road into Redditch, but this only accounted for one failure.

Altogether the trial was thoroughly satisfactory from every point of view, and the competitors freely praised the excellent arrangements, alike as regards route marking, number of officials, and prevention of baulking on hills; indeed, the organisation was such that it might well be copied by many older and more experienced clubs.

Results.

HIGH SPEEDS AT STILE KOP.

Remarkable Performances of Sunbeam Riders in the Birmingham M.C.C. Open Hill-climb.

A Racing Morgan, Fastest of the Passenger Machines.

THERE was something of the old enthusiasm prevalent at the hill-climb last Saturday, organised by the Birmingham M.C.C. at Stile Kop, near Rugeley. A sprinkling of trade men certainly provided all the sensational ascents, but the performances of that ceteric were something to marvel at. The record for the hill must have been broken on several occasions, and the exhibition of G. Dance, a comparatively unknown rider from the Sunbeam factory, earned for him constant applause from the spectators, most of whom congregated on the natural terrace at the hill summit. No matter whether he rode his special overhead valve 2¾ Sunbeam or a 3½ of the same brand, the result was the same—an easy win.

No less wonderful was the performance of that fine old sportsman J. E. Greenwood—the Sunbeam designer—who, piloting a 4 single-cylinder Sunbeam sidecar, streaked up the hill in 57⅘s. = 44.2 m.p.h.—thus knocking a second off his 1915 record. The Sunbeams, it might here be stated, were splendidly workmanlike special two-speeders with nothing freakish. They had Dunlop tyres and Amac carburetters. Each of them shot off the starting tape like a catapult, and accepted top gear at a good 40 m.p.h. within sixty yards of the starting point, gathering speed to a mile a minute. Probably nothing like it has been seen hitherto.

The Pace of the Two-strokes.

But if the Sunbeams shone so conspicuously, there were other mounts possessing a surprising turn of speed. Those who are apt to look upon baby two-strokes as potterers' mounts—as "Ixion" so fondly terms them—should see the hill-climbing Levises perform. In the touring classes they had matters entirely their own way, whilst in Class IV. for 350 c.c. machines young Gus Kuhn covered the threequarter-mile course in 57⅘s., his exhaust droning like a monster bumblebee. But he was beaten by a second by an older hand in E. Kickham, who rode a yellow-finished Douglas with an overhead valve engine, though the latter had in turn to admit defeat by the invincible Dance—who simply "jazzed" up—on his overhead valve 2¾ Sunbeam. The striking successes of overhead valve engines on Saturday may have an influence upon future design, for, as we have many times urged of late, the old fear of broken valve heads falling into the cylinder should be non-existent, for valves of correct design and of aircraft specification need not break.

Axford had them on his M.A.G.-engined Matchless, which was notable for its smooth ascent of the hill. This machine had a governor pulley of a type tried many times in years gone by, wherein balls attached to bell crank levers fly outward by centrifugal force and close the pulley flanges. Belt slackness was taken up by a lever mounted beside the tank.

Horsman, of Liverpool, had a Singer tuned to perfection in Class VI. (solo mounts up to 600 c.c.). He rode magnificently, and led this big class on time until the ascent of the last man; it happened to be Dance! The open event perhaps naturally attracted the most entries, J. W. Woodhouse being among them on his 8 Zenith-Jap. An entry of a 3½ "Draper" proved to be a 1910 Triumph with an extraordinary cylinder touching the top tube. It is owned by A. D. Draper, a clever and enthusiastic amateur, who, as an engineer, delights in experimental work. His machine had, too, a variable pulley and scoops collecting air for the main and extra air supplies of his old pattern B. and B. carburetter, and we were assured that the machine will touch 80 m.p.h. when in perfect condition. Several Norton riders did well, travelling at a rare pace on the straight, steep stretch; but they, as many others, were handicapped at the start by the absence of a gear and clutch. We timed several riders to lose four seconds in the first 120 yards. One or two American big twins provided variety, but, monotonous as it may seem, these and all the other big machines were handsomely beaten by the 2¾ Sunbeam, Dance up, whose time was 48⅕s., which performance at the same time gave the rider the highest figure of merit of the day. He had already accomplished fastest time on his 3½ in 45⅕s., equalling 56.56 m.p.h.

In the passenger class several touring machines made good climbs, but Saturday was no day for amateurs. O'Donovan's speed was something to behold; but, naturally, in using a single-geared belt-driven machine, the valuable seconds he lost in laborious pushing to start (no assistance was allowed) could never be regained. J. E. Greenwood was clocked 57⅘s. on his two ascents, which means quite 50 m.p.h. on the steepest stretch. On the last ascent he swung out to avoid a competitor on the bend at the top and shot up the bank, overturning the machine. He and his daughter (who occupied the sidecar seat) were severely shaken, but, luckily, escaped serious injury.

Fifty-five Miles per Hour Uphill.

The last ascent was probably the most spectacular climb of the day. H. F. S. Morgan, with Mrs. Morgan as passenger, had entered their eight valve M.A.G.-engined racing runabout, famous in pre-war days. The bellowing of its exhaust foretold something exceptional, and the spectators were not disappointed, for, at the word "Go," the machine shot off the mark, the top gear being engaged within eighty yards and a speed of 55 m.p.h. attained, which was subsequently reduced to 50 m.p.h. on the steepest stretches of 1 in 9—we quote Mrs. Morgan's observations of the speedometer needle—flashing over the tape at little short of 60 m.p.h. This exhibition was greatly enjoyed by the spectators, and proved a fitting climax to a long but interesting afternoon's sport, upon which the many willing officials of the Birmingham Motor Cycle Club are to be congratulated.

The Results.

CLASS I.—SINGLES AND TWINS (SOLO) UP TO 230 C.C.

	Time. Sec.	Figure of Merit.
W. H. Butterfield (2¼ Levis)	75⅖	257
A. Butterfield (2¼ Levis)	76⅘	219
O. E. Carter (2¼ Levis)	92⅖	140
G. Denley (2¼ Velocette)	93	162

CLASS II.—SINGLES AND TWINS (SOLO) UP TO 275 C.C.

A. Butterfield (2¼ Levis)	74⅘	230
W. H. Butterfield (2¼ Levis)	76⅘	247
G. Kuhn (2¼ Levis)	86⅕	147

CLASS III.—SINGLES AND TWINS (SOLO) UP TO 300 C.C.

R. E. Pugh (2½ Levis)	68	202
W. H. Butterfield (2¼ Levis)	76	252
G. R. Haggard (2½ Haden Union)	85	146

CLASS IV.—SINGLE AND TWINS (SOLO) UP TO 350 C.C.

G. Dance (2¾ Sunbeam)	49⅘	370
E. Kickham (2¾ Douglas)	56⅘	255
G. Kuhn (2¾ Levis)	57⅘	252

As showing the value of the formula recommended by *The Motor Cycle*, and now almost universally adopted, it may be noted that the positions on time and formula were identical in the case of the first three in this class as well as the following:

CLASS V.—SINGLES AND TWINS (SOLO) UP TO 500 C.C.

	Time. Sec.	Figure of Merit.
G. Dance (3¼ Sunbeam)	47⅘	307
T. C. de la Hay (3½ Sunbeam)	49⅕	285
J. Shaw (3½ Norton)	53⅘	248
H. Petty (3½ Norton)	55	—
H. Le Vack (3½ Edmund-M.A.G.)	55⅘	—
J. Smith (3½ Triumph)	56	—

CLASS VI.—SINGLES AND TWINS (SOLO) UP TO 600 C.C.

G. Dance (3¼ Sunbeam)	45⅕	317
V. Horsman (3½ Singer)	52	249
S. R. Axford (3½ Matchless-M.A.G.)	52⅘	290
H. Petty (3½ Norton)	53⅘	249
S. A. Vandervell (3½ Norton)	54⅘	254
J. W. Draper (3½ Draper)	54⅘	219

CLASS VII.—SINGLES AND TWINS (SOLO) OPEN.

G. Dance (2¾ Sunbeam)	48⅕	398
E. Bottomley (7-9 Harley)	51	—
J. Shaw (3½ Norton)	51⅘	261
V. Horsman (3½ Singer)	52⅖	253
H. Petty (3½ Norton)	53⅖	253
S. R. Axford (3½ Matchless)	53⅘	279

There were thirty competitors in the above—the best supported class.

Acceleration Test.

A stopping and restarting contest was sandwiched among the classes, open to all entrants in the other classes. Some excellent performances were witnessed. In the end, G. Dance (3½ Sunbeam) won.

CLASS X.—SIDECARS UP TO 600 C.C.

	Time. Sec.	Figure of Merit.
J. E. Greenwood (4 Sunbeam)	57⅘	284
D. R. O'Donovan (3½ Norton)	72⅖	218
H. Smethurst (3½ Norton)	83	166

CLASS XI.—SIDECARS OVER 600 C.C.

J. E. Greenwood (4 Sunbeam sc.)	57⅘	285
J. W. Woodhouse (8 Zenith sc.)	68⅘	—
D. R. O'Donovan (3½ Norton)	74⅗	210

CLASS XII.—THREE-WHEELERS.

H. F. S. Morgan (10 h.p. Morgan)	56⅕	—

A protest was lodged against E. Kickham. The foregoing results were issued with commendable promptitude on Saturday evening, but they are subject to confirmation by the Birmingham M.C.C.

THE LATE MR. J. R. NISBET.

A Great Loss to the Motor Cycle Movement.

IT is with sincere and deep regret that we have to announce to our readers the sudden death of Mr. James R. Nisbet, chairman of Messrs. Bowden Wire, Ltd., and of Messrs. Hay, Nisbet and Co., of Glasgow, publishers. He had been in poor health for some months, but had apparently received considerable benefit from a visit to the United States on behalf of the first-named company, so his sudden demise at his Golder's Green residence on the 17th inst. came as a great shock to his numerous friends.

The late Mr. Nisbet's work for automobilism has been of incalculable value from the earliest days. He was a member of the committee of the Royal Automobile Club and of the Touring Committee of the same institution, but it was not until 1909 that he took a serious interest in the motor cycle movement. It arose from a visit to the Isle of Man to witness the Tourist Trophy Race of that year, and we remember well when talking to him on the boat on the way home how enthusiastically he expressed himself as to the magnificent sport motor cycling provided. From that date on he devoted his spare time to encouraging the pastime in every possible way, and became a member of the Auto Cycle Union committee as an R.A.C. representative.

He was an exceedingly busy man, but except during the war, when he devoted himself to working entirely in the national cause, he always found time to attend the various committees of the A.C.U. He was a vice-president and chairman of that body, and a member of the Management Committee, on which his sound common-

Mr. J. R. Nisbet, late chairman of the A.C.U.

sense, his shrewdness, his Scotch thoroughness, and his wise decisions played a most important part in bringing the Auto Cycle Union from a very small beginning to the high position it now occupies.

The Auto Cycle Union has lost a valuable leader and one whom it will be very difficult to replace; while the movement on the whole has lost a valuable patron, who was no figurehead, but one who worked skilfully and assiduously for the cause, and who will indeed be sorely missed. We extend our heartfelt sympathy to his widow, sons, and daughter in their sad bereavement.

Mr. Jas. R. Nisbet was buried on Friday, the 22nd inst., at Cathcart Cemetery, Glasgow. Amongst those present were: Mr. Alex. Nisbet, Mr. Jas. R. Nisbet, Mr. W. Nisbet (sons of the deceased), and several other relatives; Mr. John Adam, Mr. R. J. Smith (Scottish Automobile Club), Mr. T. Loughborough (Royal Automobile Club and Auto Cycle Union), Mr. Norman MacMillan and Mr. J. S. Fulton (Scottish Auto Cycle Union), Mr. Otto Thomas (Messrs. Iliffe and Sons Ltd.), Mr. Alex. S. Ross (Bowden Wire Ltd.), Mr. Jas. Gibbon, Mr. Jas. Livie, Mr. Chas. Middleton, Mr. Robert Livingston, Mr. Jas. Woodburn (director, Messrs. Hay, Nisbet and Co., Ltd.), Mr. Geo. H. Cuthush *(Motor World)*, and Mr. A. C. McMinn *(Scottish Cyclist and Motor Cyclist)*.

Wreaths were sent by the following: Frank Shorland, Alec Ross, Iliffe and Sons, Edmund Dangerfield, Otto Thomas, Royal Scottish Automobile Club, Royal Automobile Club, Auto Cycle Union, Hay, Nisbet and Co., Ltd., Cycle and Motor Cycle Manufacturers' and Traders' Union, Bowden Wire, Ltd., and J. Mackenzie.

Glasgow M.C.C. 100 Miles Non-stop Reliability Trial.

THE annual trial was held on Saturday over the usual circular course, starting at Strathblane. The route was *via* Lennoxtown, Fintry, Killearn, Blanefield, Cult Brae, Dryman Road, Kyber Pass, and back to Strathblane.

Competitors had to cover this course three times, the total distance being approximately 100 miles. In addition to the usual gold medal for competitors who ran to time at the various checks and had no stoppages a special prize was presented by Geo. H. Cuthush, the vice-president of the club.

Sixteen competitors started from Strathblane at 3 p.m. I. A. T. Cheyne (6 A.J.S. sc.) was the first victim, puncturing three miles from the start.

The majority of the competitors made good ascents of Cult Brae. One or two, however, took the top bend a little too fast, notably G. Munro (5-6 James), who nearly came to grief.

G. Grinton (7 Harley-Davidson sc.) made one of the best ascents of the round.

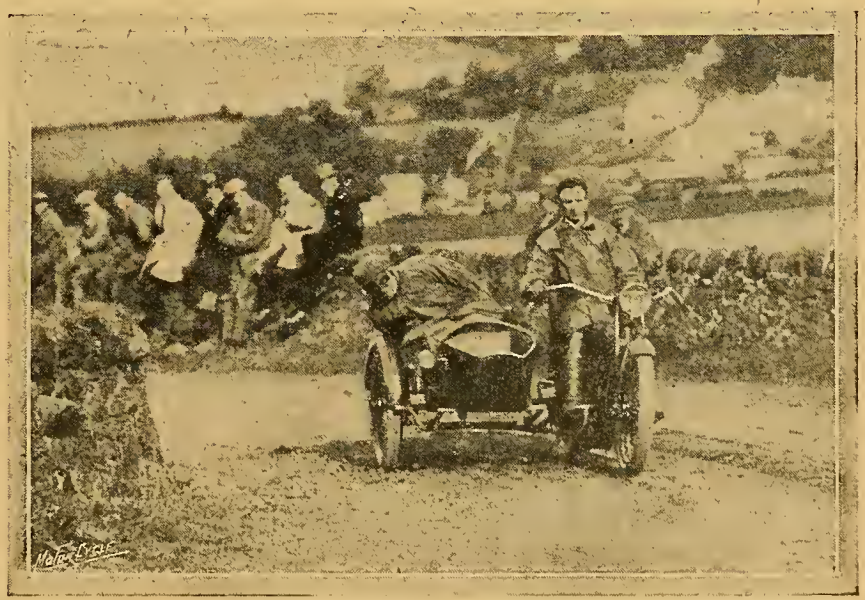
R. D. Robertson (8 Ariel sc.) stopped while changing his gear on Strathblane on the second round.

Several of the competitors had auxiliary tanks fitted, the more favourite being a petrol tin strapped on the carrier.

W. Deans (3½ Ariel) had a new puncture-preventer fitted, which appeared to serve the purpose very well.

The following are the gold medallists:
W. Deans (3½ Ariel)
G. Munro (5-6 James)
S. J. Brown (4¼ New Hudson)
R. N. Lochhead (3¾ Scott)
E. S. Pleiffer (8 New Imperial)
D. S. Alexander (8 Enfield sc.)
G. Grinton (7 Harley-Davidson sc.)

The special prize was won by G. Grinton (7 Harley-Davidson sc.), whose total error was 2m. 42s., W. Deans (3½ Ariel) being next with an error of 3m. 47s.



G. Grinton, 7 h.p. Harley-Davidson sidecar, on the top bend of Cult-Bray. He won the special prize.

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

A TRIAL FOR SCOTT RIDERS.

Sir,—We have pleasure in informing your readers that it is our intention to hold the Scott Trial this year, as before the war.

It will be held by permission of the Cycle and Motor Cycle Manufacturers' and Traders' Union, Ltd., and will be a private one by invitation, and we hope shortly to be able to publish all particulars.

THE SCOTT MOTOR CYCLE CO., LTD.,
N. O. VINTER, CAPT., Sales Manager.

MOTOR CYCLES FOR EX-SOLDIERS.

Sir,—I notice in your issue of June 26th that a special concession has been granted by the Government to the War Motors Association by which ex-motor cycle despatch riders are to be given first refusal of surplus Government motor cycles. Do you not think this unfair? Why should not every ex-soldier who has seen Active Service have the same opportunity? Surely an infantryman has as much right to the concession as a despatch rider, and, as regards Army pay, the latter is more able to purchase a new machine.

DISCHARGED HIGHLANDER.

A HEAVY FINE.

Sir,—I should like to call your attention to a summons and fine recently inflicted on a friend of mine which occurred at Huntingdon Police Court on Wednesday, August 13th, and warn readers of your world-read journal to avoid a similar expensive awakening.

My friend and I were visiting friends at Huntingdon, but, unfortunately, my tyre burst at Godmanchester, so my friend offered to take me into Huntingdon for necessary repair outfit. We exceeded the ten-mile limit, and the police summoned him to appear on the Wednesday. He started from town and had a breakdown *en route*, and arrived late. He then learned in his absence he had been fined £5—his first offence, as he has just commenced riding.

Highworth. FAIR PLAY.

A MOTOR CYCLE TEST OF BENZOLE.

Sir,—With regard to your article in the issue of *The Motor Cycle* of August 21st concerning benzole, I have pleasure in informing you that arrangements were put in hand for a motor cycle benzole test at the same time as those for the car test.

It is not proposed to run a motor bicycle over the same route as the 10,000-mile car test, but to conduct the trials from the various local areas of the Automobile Association.

Further particulars with regard to the test will be communicated as soon as arrangements have been completed.

STENSON COOKE,
Secretary, Automobile Association and Motor Union.

SPARE PARTS.

Sir,—Having noticed several times in *The Motor Cycle* letters from motor cyclists who have received prompt attention to orders and delivery of spares by various firms, I think that the Auto-Carrier (1911) needs some beating. I have one of the above firm's sociables, and from time to time I have sent for spares. I have aways received return of post delivery, which is remarkable considering that the firm is not now making the machines.

I might add that I am not in any way connected with the firm, nor a relation or "pal" of any of the staff.

F.A.T.

Sir,—Motorists generally have a grievance. I have one, and I put down the same to the prosperity of the times. Firms can be independent, and the "dust plugger" consequently comes in for a great deal of annoyance and inconvenience when he is out for spares. To the firms spares may be trivial things: to him who is wont to bang along the King's highway they are of vital importance.

In need, sore need, of two chains recently, I sent a prepaid wire to the makers for an estimate of cost and asking them to send at once as the matter was urgent. To this day I have had no reply, and this in face of the fact that I sent another wire. Silence is golden, and the firm must be in a position of beautiful and golden security when it can afford to ignore the possessor of the machine manufactured by it.

R. WARD-DAVIES.

THE LIGHTING REGULATIONS.

Sir,—I most certainly disagree with your leader *re* lighting regulations. Not, mind you, on the merits or demerits of the question of whether it is advisable to carry a rear or sidecar lamp, but (and I have the ninety and nine point nine with me here) on your hope that in the near future legislation will be revised. *(Deus avertat!)*

Surely to goodness we have had enough interferences from the police during the war to satisfy without asking for more. Is it necessary for us to provide the police with one of the finest sports they ever had?—a sort of cat and mouse thing, inevitably successful even against the most careful and law-abiding.

Of all tantalising evils I think the rear lamp is the prince. To keep it burning with certainty is an absolute impossibility. It requires a look round every 100 yards, and the only accident I have had in ten years riding was due to that self-same "eyes back," and too late to dodge a cyclist issuing from a side street.

No, sir; I do not think your advocacy of legislation will "take on."

LIBERUM ARBITORIUM.
St. Helens.

A 5-6 h.p. Rudge sidecar with a happy party of potential motor cyclists aboard. Cramped quarters and pot-holes only add to the fun for these youthful sidecarists. Would that it was always so when fair and more critical passengers take the sidecar seat! The photograph was sent by Mr. E. J. Parkins, of Putney.

A.A., FORWARD!

Sir,—While riding from Bristol to Seaton *via* Bridgwater, Taunton, Chard, etc., I had a bad smash at a place known locally as "Hatch Corner," near Hatch. When coming along the road it appears that the corner is a very gradual one, but really it is an acute angle, with the road sloping in the wrong direction and a stone wall in front. The farmer to whom the wall belongs told me that there were three or four accidents a week there. There is absolutely no danger sign whatever. GOFTON H. GEE.

PILLION RIDING.

Sir,—There have been three fatal accidents to motor cyclists in the Darlington district this summer. In each case there was a pillion passenger, and in each case the pillion passenger was killed. Also in each case the driver failed to avoid collision with an approaching vehicle, whose drivers, singularly enough, were all exonerated. In every reported case of fatal accidents to motor cyclists this summer there has not been one in this locality where a pillion passenger was not carried. J 1824.

Darlington.

Sir,—I read with infinite amusement the remarks made by Harold Karslake in his letter published in your issue of the 14th inst. Since his powers of observation (through the *Daily Mail)* appear to be so great, perhaps he has read particulars of deaths of passengers in aeroplanes, and through accidents occurring to train, tram, and omnibus—in fact, every moving vehicle. Many people have been drowned bathing in the sea and river.

When will these senseless and criminally dangerous practices be prohibited?

Someone fell into a canal the other day and was drowned—canals are dangerous things and should not be allowed.

The first time I drove a motor cycle I took a friend on the back. Nothing happened. When I first started driving a sidecar I had two accidents in one day.

A. F. PHILLIPS.

Sir,—I am the last in the world to fly into print, but feel I must to express my sentiments on pillion riding.

If "A.C.R.," "Harold Karslake and Co." do not like it themselves, then my advice to them is to leave the sportsmen alone who do like it.

I was the owner of an 8 h.p. Zenith-Gradua and sidecar, and one day near Catterick I had to take my sidecar through the hedge to avoid a lady on a push bicycle, who was travelling round a corner on her wrong side. It all happened in a moment, and if I had not had that beastly sidecar on I should not have been walking with a stick for days after.

One lives and learns, and now my sporting flapper climbs up behind me, and we have consigned our broken sidecar to the scrap heap.

If some of your readers knew more about the principles of mechanics than they appear to do, they would not raise the sidecar above the pillion.

If they want to be confined to bath chairs all their lives, then I for one would not object, so in return I expect at least to be allowed to choose my means of transport.

Newcastle. BIG TWIN.

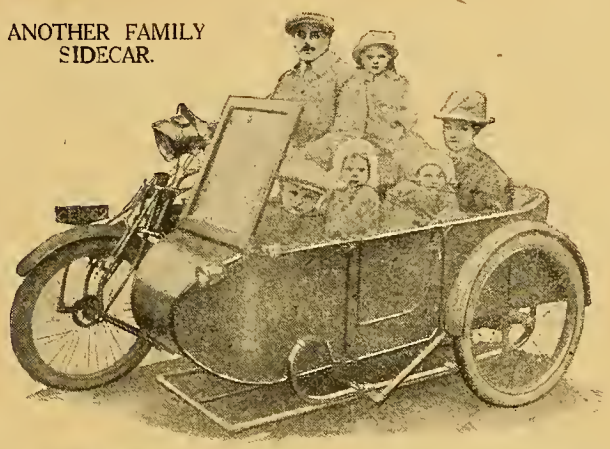
COURTESY OF THE ROAD.

Sir,—During the week-end I have been touring in Suffolk with a friend on the back of my 2¾ h.p. Douglas, and on Sunday afternoon, after spending the morning on the lonely beach near Dunwich, I found that my magneto was wrong, and, in spite of the combined efforts of a motorist and his wife, we could not rectify the fault. I was ten miles away from the hotel where we had arranged to spend the night, and, although in an opposite direction to the way they were going, they offered to tow my friend and me into Yoxford—our stopping place—and before doing so asked us to share their tea, which we were pleased to do after a nine hour fast. This, I think, is an excellent example of courtesy.

As regards the magneto mechanic, I was recommended to go by train to Oulton Broad and see Mr. Chipperfield, and although he was witnessing a Regatta on the Broad, he came along to his shop, very smartly traced the fault to a small hole in the plug attaching the H.T. wire to the magneto, which allowed the current to short on to the magneto. He offered to turn up a new plug from ebonite for me at once, and after about three hours I had this on the machine and ready for the road, both cylinders firing regularly and well; for the service I was charged 7s. 6d., which I consider very cheap, and the work is well done—evidently by a man who knows the magneto from A to Z.

ALLEN S. BERRY.

ANOTHER FAMILY SIDECAR.



Photographs of outfits with five or six passengers aboard continue to reach us. All of them point to the fact that if ever the runabout replaces the sidecar—which is questionable—the family man will have bigger accommodation problems than he had with his sidecar. The Matchless shown accommodates six in all.

Sir,—I desire to add my experience regarding the matter of the "old-time" courtesy of the road. I agree with "W.W.B." that to an extent this has diminished, but I am quite certain the matter has only to be discussed through your columns and there will be an improvement in a very short time.

There are few motorists who go any distance from home but find they are soon able to give assistance, or require this. My Whitsun run was from Bristol to Birmingham and back, returning *via* Chipping Norton and Cirencester. About 6 p.m., on Monday, I found myself between Chipping Norton and Burford, where there was very little traffic, with tyre trouble, and foolish virgin that I was no tyre levers—through a lost companion, and no patches. The only passers-by, in the course of an hour, were two ordinary cyclists and two drivers of motor cars. When one of the latter came in sight I signalled, and obtained very kindly the help desired.

What I suggest is that any motorist hung up and desiring assistance might help the case by a timely signal to an oncomer by, say, raising the right hand. It frequently happens that a stop has been made and for no particular cause, and there is no assistance required. I have ridden since 1903, but I scarcely remember any instance when I have sought help, without having my signal answered. On the other hand, one does not wish continually to stop without any purpose. I recently ran to Cheddar, a matter of twenty miles, and passed several combinations pulled up for trouble of various kinds. I assisted at the first two, and slowed down at the rest, but in not one instance did I see any sign before approach that help was needed. I would like the opinion of other riders on the point. J. T. MAYO.

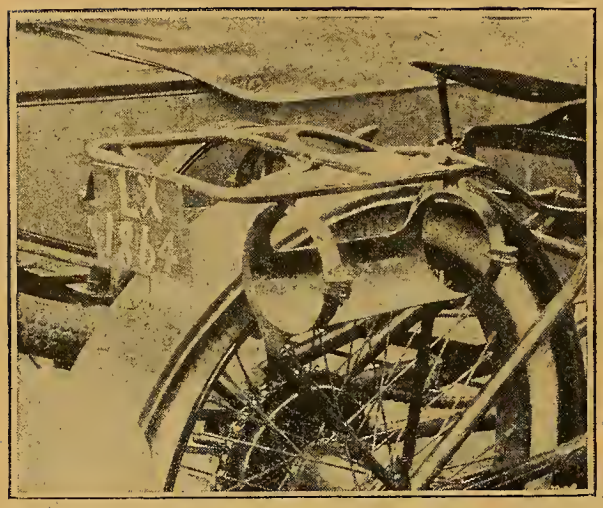
Bristol.

PLEASE QUOTE PRICES!

Sir,—Having noticed several remarks about the inadequate information given in advertisements, I feel that I must say a word in defence of the manufacturers. It seems to me that anyone requiring a motor cycle would want to know far more about the machine he fancied than any advertisement could possibly give. If "H.E.R." would like to have full particulars of the Scott he has only to write to that firm for them, and he will find his every wish gratified.

I may say that I am not interested in the firm in any way, except that I am shortly taking delivery of one of their most excellent machines, and in fairness to them I must say that no one could have shown me more consideration or sent more information than they did. S.B.

Keswick.



Special holders, integral with the carr.er, are fitted on the French G.L. motor cycle for the purpose of carrying D.A. cylinders. The G.L. was described in last week's issue.

A MOTOR CYCLE CLUB FOR THE ROYAL NAVY.

Sir,—It is with great pleasure that I read of Lt. Evans-Greaves proposed plan of forming a motor cycle and cycle car club for the Royal Navy.

Owing to the two bases of the Home and Atlantic Fleets being so far apart, viz., Portland and Rosyth respectively, I would suggest that each base has its own team, likewise the three depots—Portsmouth, Devonport, and Chatham. It might then be found possible for each centre to have its own garage, where machines could be stored.

A governing body could then be appointed, which would have charge of funds, etc., and which would arrange for competitions and runs, and be generally responsible for the well-being and future development of the club.

If Lt. Evans-Greaves can make use of my services in any shape or form I shall be only too pleased to give all possible assistance. F. C. FELLOWES, Signalman.

H.M.S. *Royal Sovereign.*

ENGINE DESIGN.

Sir,—One or two of your readers are asking for information respecting the advantages of outside flywheels. This, to my mind, is incomprehensible, as a few minutes' study of the question points at once to the friction losses generated by internal flywheel rims. When sufficient oil is present for lubrication purposes, this oil is in contact with the flywheels, and during rotation of the latter, is thrown off tangentially due to centrifugal force. A constant film of oil is thus maintained between crank case and flywheels (the clearance being very small). This film is in constant shear, and as the friction of a liquid increases as the square of the velocity, it is easy to see that a heavy oil which makes a good lubricant for working parts produces considerable braking effect when brought into contact with parts moving at high velocity, such as the rim of a flywheel.

The flexibility of machines possessing outside flywheels and the ease with which they accelerate must be known to most riders. This flexibility I attribute solely to two causes, the use of an outside flywheel and the substitution of ball or roller bearings for plain bearings on the crank-shaft. My remarks concerning friction of flywheel rims apply in a smaller degree to plain bearings, and the losses set up in these at high speed are not so small as the average man is inclined to think. When perfectly reliable ball bearings are so cheap it seems absurd to use any other in cases where the ratio of nett power to gross power developed is of the utmost importance if weight and petrol consumption are to be reduced to a minimum.

I am aware that the incorporation of new designs upsets existing standard designs, but where actual improvements are concerned, makers should not be backward in following a good lead. ENGINEER.

Newcastle-on-Tyne.

A CANDID CRITICISM.

Sir,—I notice a correspondent enquiring for experiences of 1919 machines. I have ridden a 1919 Triumph for about 3,000 miles, and venture to offer a few criticisms on this excellent machine. The handle-bars are adorned with no fewer than six Bowden wires, and it has so far defeated me to find any arrangement of the various levers by which they can all be used as and when required. Personally, I prefer a foot clutch, but as I believe I am in a minority in this respect I cannot blame the makers for fitting it there. The air lever I have never found any use for, the carburetter being entirely automatic, and certainly a Bowden wire for this is unnecessary. The magneto advance could be fitted on the tank, as it is seldom necessary to move it.

The tank capacity is inadequate, and I have frequently had to stop twice on a day's run to fill up. If the tank were 6in. wider, the comfort of the machine would be enormously increased. The front brake I find extremely useful. The spring forks I consider by no means so bad as they are made out to be. They certainly frequently broke springs in France, but the spring forks fitted to other machines there, so far as my experience went, suffered a far higher mortality, but escaped comment owing to the overwhelming variety of other troubles which beset the machines. The valve gear remains noisy. The paper washer under the cylinder is liable to get damaged when decarbonising, and something more permanent than paper might be fitted. Apart from this, the engine would keep very clean.

In reliability, the machine is the equal of the best American machines, but this is offset by the paltry tyres fitted. They make the machine miserably uncomfortable to ride, and punctures average about three and one-third per 1,000 miles, as against one and a half per 2,000 miles on American machines.

The engine is really delightful, and its balance at high speeds has been quite a revelation to me. The carburetter also is excellent, but anything more awkward than the handle-bar levers I cannot imagine. Why ever not fit a hand-controlled air slide on the carburetter itself?

Personally, I prefer the antiquated hand pump lubrication to any other system I have tried. The oil consumption is remarkably small. Petrol consumption is about 87 m.p.g. at 20 m.p.h. average, and about 70 m.p.g. when the machine is hustled, which I consider very fair. There are a number of small screws in connection with the tool bags which tend to lose themselves. The gear box is perhaps the least reliable part of the machine, but its troubles are of a minor nature. The fulcrum of the gear lever might with advantage be more securely seated in the quadrant. A draw bolt should be provided for adjusting the chain. The only method of sliding the gear box is by treading on the belt, which causes it to slip.

There is a delirious joy in riding the machine at speed like unto looping the loop on a bareback mule. On the average Yankee machine one becomes part and parcel of the outfit after a few rides, but I shall never grow to fit this Triumph. I have not called attention to the numerous good features of the machine, because we read of these in the papers. I think it leads many British machines by about five years. J. KENNEDY, Major R.G.A.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with "*The Motor Cycle.*"

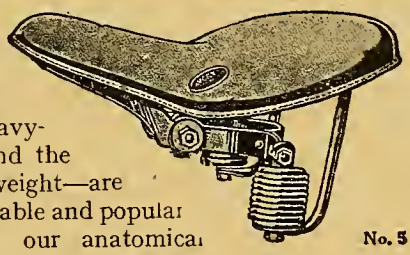
"Lycett's"

Motor Cycle Seats

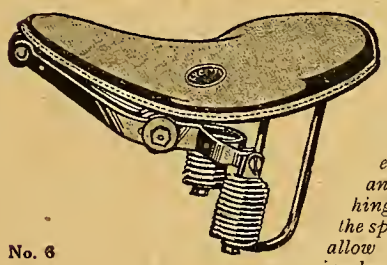
LYCO No. 5 & No. 6



No. 5

—the former for heavy-weight machines and the latter for the lightweight—are exceedingly comfortable and popular models, embodying our anatomical Seat and Patent LYCO Spring-Action.

The LYCO Spring-principle is this:—



No. 6

The saddle is hinged at its peak, and its special springs are anchored dead-centrally at top and bottom on two swivel fastenings, which ensure a perfectly straight pull, eliminating twisting strains, and obviating breakages. The hinged peak, swivel action on the spring, and dead central pull, allow the saddle to describe a circular movement at the back when the seat is depressed under the rider's weight.

For sensitive saddle-action and smooth, easy riding, there is no springing system to equal the "LYCO" principle.

LYCETT'S

The Saddlery, BIRMINGHAM.

To be Ultra-Fashionable

"The Motor Cycle" says you must have WHEEL DISCS, but to be up to the minute your machine should be equipped with the "ACE" DISCS. The only perfect disc in the market, because:—

It incorporates the only practical method of fixing:—by means of a central flange (Pro. Pat. No. 11816/19).

It cannot rattle or work loose.

It has an invisible welded joint.

It is a perfect fit and gives the appearance of a solid disc wheel.

It is dust proof and preserves the spokes and rims, and saves hours when cleaning the machine.

Read what a Practical Motorist says in "The Irish Cyclist & Motor Cyclist":—

"Disc wheels? In plenty. The neatest I have ever seen are the 'ACE' made by

The DISC ENGINEERING Co. of Whitefriars St., Coventry.

They are really superb. Flange fixing. No ugly nuts and bolts to break up the smoothness of the disc."

Note the address, and write now for prices and particulars.

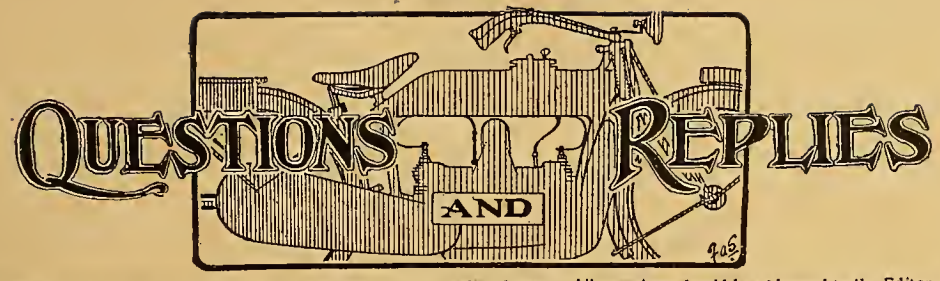
Name.....

Full Address.....



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Vague Request.

As an absolute novice desirous of purchasing a new motor cycle, I shall be glad if you will tell me: (1.) What make and horse-power can you recommend? (2.) Where can I obtain tuition? (3.) What would be the approximate running expenses per hundred miles?—J.F.T.

(1.) Not knowing your requirements as regards the district in which you will be riding, or the weight you will have to carry, we can scarcely advise you on the make and horse-power of a machine to suit you. In any case, it is impossible for us to recommend one particular manufacturer's products, but if you will write again giving us more definite information, we will do our best to help you. (2.) You could no doubt obtain tuition in driving from a local garage, or the agent from whom you purchase the machine. (3.) For a 3½ h.p. solo mount you may reckon roughly 1d. per mile.

Magnetic Insulation.

I notice you have from time to time questions concerning electricity, chiefly magnetos. Could you by any means answer the following: Is there any substance that, when placed between the poles of a magnet or, rather, in a magnetic field flowing one way, say, from north to south, will resist the flow? I understand that mica and zinc will in a small degree, but I cannot see it. I have bought the best books and got advice from electricians, but with no result. My chief reason for wanting to know this is to protect some delicate electric measuring instruments from magnetic influences. I am quite familiar with cross magnetism, etc.—W.J.

We believe that there is no substance which makes any practical difference to the flow of magnetic lines in the same way as in insulating material will prevent the flow of an electric current. The usual course to adopt in such cases as you mention is to surround the instrument to be protected as completely as possible with a thick iron screen so as to deflect the lines of force. As the iron has so much greater magnetic permeability than air, the lines of force will naturally travel through the iron screen, and the air inside will be practically free from magnetism. For instance, if a piece of thick iron tube was placed between the poles of a horse-shoe magnet, the lines of force would almost entirely concentrate in the walls of the tube, and the space inside would be completely screened. We think that some adaptation of this method will answer your purpose, so far as we can judge from the particulars supplied.

A Novice's Requirements.

I require a machine for week-end runs between London and High Wycombe. It would not be used for touring, but I think a light sidecar for luggage would be useful. (1.) What is the lightest machine to do such work safely? (2.) Would a good 2¾ h.p. do it with a two or three-speed gear. (3.) Could I make a 2¾ h.p. do it by either temporarily or permanently reducing the belt ratio of the chain-cum-belt drive? (4.) Under normal conditions, what are the relative climbing powers of *(a)* a single four-stroke, *(b)* a single two-stroke, *(c)* a twin four-stroke? (5.) Would I be well advised to join the A.C.U. in order to get its engineer's services in examining a prospective second-hand machine? Also, is it best to buy from a dealer? (6.) Do you think a higher power than 2¾ h.p. advisable?—H.S.

(1.) You cannot expect much in the way of sidecar pulling with a 2¾ h.p. machine. Moreover, the possession of a sidecar is almost always a temptation to overload on occasion. (2.) A good 2¾ h.p. would do the work you require provided always that you kept well within the limits of weight and speed as you suggest. (3.) We do not know any two-speed lightweight which has a variable pulley on the gear box, therefore you could not make the temporary or permanent reduction of the belt ratios as you propose doing, unless, of course, you are prepared to have a special pulley of smaller diameter made. (4.) There is little to choose between the climbing powers of the three classes of engine you name. Probably the single four-stroke engine is the most suitable. (5.) We certainly recommend your joining the A.C.U., and also think it would be advisable to get your first machine from a reliable dealer. (6.) Probably a good second-hand 3½ h.p. two or three-speed single-cylinder outfit would suit you better than anything else.

3½ h.p. or 4 h.p.

Is there any rough and ready method of distinguishing between a 3½ h.p. and a 4 h.p. Triumph? I have one offered to me as a 4 h.p., but personally I think it is a 3½ h.p. It is fitted with a three-speed hub and clutch, and also decompressor under the inlet valve. If you could give me the difference in the outside measurements of the cylinders, say, that would suffice.—A.W.R.

Externally there is very little difference between the 3½ h.p. and 4 h.p. Triumph engines. The 1913 Triumph engine with decompressor was a 3½ h.p., and the 1914 4 h.p. You can most readily distinguish between the two machines by the fact that the 1913 3½ h.p. Triumphs had a straight top frame tube, while the 1914 models had a dropped top tube and tank.

Some of the members of the P.S.M.C.C. on the occasion of their recent run to Hayling Island. The central figure is H. B. Browning, the hon. secretary. On the extreme left is the Coulson-B, owned by G. W. Bonham-Carter, a member of the committee.

Misstated Date.

Three weeks ago I bought, second-hand, a Sun-Villiers motor cycle for £45, advertised as a 1917 model. I find, however, that it is actually a 1915. No date is given on the receipt which I hold, but the seller informed me he understood that it *was* 1917, and I only have his word (which is now proved to be incorrect) and the advertisement, which I have kept. Can I make the seller take the machine back again, as he obviously misrepresented the date of the machine in his advertisement, and I, of course, would not have given £45 for such an old model if I had known its real date of manufacture.—N.S.

If you can prove that the machine was represented to you as a 1917 model, and that you bought it on that understanding, you can return it and demand the repayment of your money; or you might effect some cash adjustment with the seller. The receipt is of small importance.

Garage Proprietor's Responsibility.

Owing to lack of room, I garage my combination with a local motor firm. The last time I used the machine I returned with it in good order. Two days later, on going for my machine, I found that it had been used, that the rear lamp generator had been stolen, and the gear broken. I made a complaint at once. I can obtain witnesses that the machine was all right when I last used it. The firm did not dispute my complaint, and one of their men took the gear to pieces and found the only thing broken was a ball race. At the firm's suggestion, the gear was sent to the makers to be repaired. As this was being done I asked that the kick-starter, which was out of order, should be put right as well. What the firm wrote I do not know, but all worn parts were replaced and a *pro forma* invoice for £5 2s. 10d. was sent. The firm refuse to send for the gear until I pay them this money. I did not order the gear to be overhauled, which the firm admit. The cost of repairing the kick-starter is only 1s. 4d., and the broken ball race 3s. The firm now say that I can have the gear for trade price. (1.) Is the firm liable for the damage to my machine, also the theft? (2.) Can the firm make me pay for the overhauling which I did not order and was not necessary? (3.) Should the firm refuse to send for the gear? What is the best thing to do?—W.R.B.

Our legal adviser replies as follows: "The owner does not explain the circumstances sufficiently for me to say whether the garage proprietor is or is not liable for the theft of the rear lamp generator, or for the damage done to the gear. To make him liable he would have to show that there was some negligence on the part of the garage proprietor. However, the firm do not appear to dispute their liability with regard to the gear, but, apparently, they are only liable for 3s., and if the order to the makers was quite clear it would seem that the most they could legally claim would be 4s. 4d. At the same time, the gear has evidently been improved, and it looks as if it would be reasonable to come to some amicable settlement. Failing this, I think the proper course is for the owner to send the makers the 4s. 4d. and to sue them for the return of the gear. I am assuming he sent it direct to them and not the garage proprietor. If the garage proprietor sent it to them, then the proper course would be to pay him the 4s. 4d. and sue for the return of the gear or for damages, and then let him bring the manufacturers into the action as third parties. As the matter is somewhat complicated, it would be well to put it in the hands of a local solicitor.

Gearing for Sidecar.

I am about to fit a new 4¼ h.p. engine and Sturmey countershaft gear to my motor bicycle, but am in difficulty as to (1) What number of teeth and what pitch and width should I have on engine-shaft? (2.) Number of teeth on countershaft sprocket? (3.) What gear ratios do you advise for use as passenger vehicle?—R.J.

(1.) Fifteen-tooth sprocket, ⅝in. pitch × ⅜in. width. (2.) Thirty teeth. (3.) The ratios will depend on the weight of the outfit and the nature of the district in which you are riding. We would suggest a top gear of about 4⅞ to 1.

Unsteadiness at Speed.

(1.) I have a 6 h.p. 1916 Zenith-J.A.P. with clutch, etc. I want to fit a drip feed like the Best and Lloyd, and take the pipe into the box on the side of the crank case, plugging up the valve hole at the bottom of the sump. Will this work all right? (2.) At speed over 35 m.p.h. the motor bicycle wobbles very badly. How can I stop this? It has heavy type Druid forks, the pins are a good fit, and the steering head properly adjusted.—JUNGLE (India).

(1.) There would be no objection to fitting a Best and Lloyd drip feed to your twin Zenith, but we should advise you to lead the oil pipe into the crank case in the same manner as it is led at present from the standard oil pump. If you plug up the valve at the bottom of the crank case you will interfere with the special lubricating system of the J.A.P. engine. (2.) In all probability the unsteadiness of the steering in your machine is due to the frame being out of truth, and, in consequence, the wheels do not track. You can test this by placing a straight edge along the wheels at each side of the machine in turn and noting whether the rims are equidistant at the four points passed by the straight edge. If a straight edge is not available, a piece of cord stretched tightly from wheel to wheel will answer the same purpose. Should the wheels not be truly in alignment it will be necessary to have the frame or forks trued.

READERS' REPLIES.

Damaged Fork-end.

In *The Motor Cycle* of August 14th one of your correspondents complains of a damaged fork end. If he is in London, might I suggest that he take it to Wards, 51, Upper Richmond Road, Putney (their advertisement is in your paper), who would weld on some extra metal, making it the same thickness and strength as before. These people can do anything with a motor cycle. They have done work for me, and I have always found them cheap, reliable, and, above all, one is not kept waiting, as the work is put in hand at once. I may add I have no connection at all with the firm mentioned.—W. D. ROE.

Lack of Power.

In reply to your correspondent "F.W.," I had exactly the same trouble with my Villiers engine; this is how it occurred. I took my engine to be rebushed; when I went for it I gave the engine a run in free and it ran quite all right, except that it would not take so much air; then when I got on 50% of its former power was gone. When I got home I had a good look round and found that about half of the crank case washer was missing, consequently I was losing compression in crank case; of course, he will have to take the whole of the engine down again to remedy this. I find a 25-jet most suitable for this engine.—T.M.L.

Re "F.W.'s" lack of power in his Sun-Villiers after dismantling. If he will examine the joint between cylinder and crank case, he will find that the joint of this portion will be damaged, most likely near the transfer port. Great care should be taken in remaking this joint, as the charge goes to atmosphere instead of being transferred to cylinder in the ordinary way; if the joint is damaged I would suggest that he remove the cylinder and remake joint with thick cardboard 1-32in. in thickness, taking care, of course, to construct correctly.—F. WILSON.

Approximately 265 miles.

THE WORLD'S BEST MASCOT

How the A.A. Badge ENSURES the motorist against bad luck on the road.

That little brass badge, with its twin A's and its spread wings above, is the modern motorist's shield and buckler, his passport and his guide. With this talisman on his dashboard he may enter upon the true and full possession of the traveller's birthright—"The joy of the Open Road."

The A.A. Badge means more to the motorist than any other car accessory. Its uses are many and its failures *nil*. Its sphere of influence covers the United Kingdom, and its servants are to be found in every part of the Country.

It will bring assistance to the motorist stranded on the road miles from a town or garage. At sight of it a battalion of *khaki-clad* A.A. patrols will undertake roadside repairs, fetch motor fuel, tyres, or replacements from the nearest garage and render all possible assistance in case of need.

It gives access to every one of the A.A. Roadside Telephone Boxes which are distributed along main roads and may be used by members for calls to hotels, garages, home, or office.

It will summon a "Mechanical First-aid" Motor Cycle with its complement of spares and tools for light repairs to car or motor cycle.

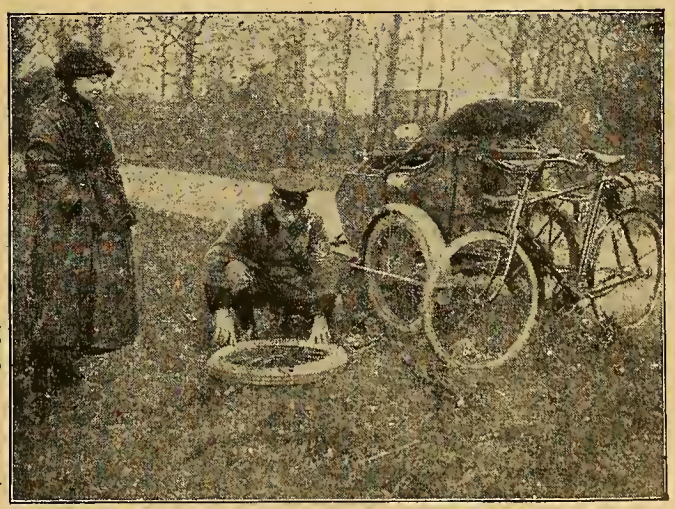
It enables a motorist to take his car into a 70 per cent. tariff country on a banker's indemnity alone and without depositing hundreds of pounds in respect of Customs dues.

It ensures good and reasonable service from any A.A. Agent and Repairer, also really satisfactory accommodation at any A.A. Hotel in England, Scotland, Ireland, and Wales.

It solves all questions regarding routes and accommodation for home tours and dispels the trouble and delay usually associated with a tour abroad.

It provides Free Legal Defence, Free Legal Aid, Special Insurance Facilities, Engineering Assistance, and in a hundred and one other ways gives the motorist what he wants when he wants it.

If you want to know how such a small object can achieve such great results, send a postcard *to-day* to the Secretary, The Automobile Association, 21, Fanum House, Whitcomb Street, London, W.C.2, for a free booktet and other information describing the many personal benefits enjoyed by members of the A.A.



MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

EASTERN GARAGE

ON PRICES.

In pre-war times certain unscrupulous dealers, having no business qualities to commend them to the prospective purchaser of a motor cycle, resorted to the short-sighted policy of secretly cutting prices. In this way they obtained orders from misguided clients who overlooked the fact that "first cost" is not the most important factor for consideration when purchasing a motor cycle.

To-day, when the demand for machines so much exceeds the number available, those same dealers are practising the equally iniquitous and suicidal policy of asking prices quite absurd for almost useless crocks, and by demanding enormous premiums for the new machines they are able to obtain from the manufacturers.

Both these practices are a distinct breach of faith with the manufacturers, and both operate to the disadvantage of the retail purchaser in different ways.

When an Agent enters into a contract with a manufacturer for the supply of motor cycles, one of the most important clauses of the agreement he signs is his undertaking to re-sell the manufacturer's goods only at fixed list prices. In departing from this either by charging less or more than list price, an Agent is guilty of breaking a solemn compact with the manufacturer, and, in so doing, proclaims himself unworthy of the confidence of the motoring public.

Throughout the whole of the twelve years the Eastern Garage Company have been established, it has been their inflexible rule to adhere strictly to list prices, and, whilst in pre-war days they relied upon "service to customers" and not price cutting to secure business, they are now equally determined to maintain minimum list prices, and are able to state that not a single new motor cycle has been sold by them at anything but fixed retail price.

Under no circumstances will The Eastern Garage Company depart from this policy regarding prices, and they are equally determined to adhere to their rule of delivering machines to customers strictly in the rotation in which their orders are placed.

If you require a new motor cycle, send your inquiry to us. We are Agents for all the desirable makes, and you can depend upon receiving scrupulously fair treatment, both in price and delivery.

The Six Days Trials Route.

IN three outstanding respects this month's Six Days Reliability Trials differ from previous events of the kind. In the first place, any hill is likely to be observed, *i.e.*, the A.C.U. will not notify competitors of the actual test hills as in former years. Secondly, a lamp test is included on the first day to prove the serviceability of the lighting equipment with which each machine must be provided. One wishes that the lamp test could be repeated on the last day. Thirdly, a consistent driving test, so successfully applied to the Arbuthnot Trophy Trial, will take place on the third and last days on the steep hill approaching Garth. It is an ascent of two miles, averaging 1 in 12. For the first mile competitors may average but 10 m.p.h., thereafter the speeds are set according to the power of the engine. As regards the route generally, most of the important centres are embraced, luncheon stops having been arranged at Abergavenny (Monday), Newcastle Emlyn (Tuesday), Bala (Wednesday), Devil's Bridge, Aberystwyth (Thursday), and Swansea (Friday). The route is severe, but the hills not so much characterised by steepness as by the rough surfaces which will be encountered. The notorious stretch from Lake Vyrnwy to Bala, a wild but beautiful district, which we first traversed in 1911, will give the competitors much to think about, for deep gulleys crossing the road diagonally will test frames to the limit. Hills there are in abundance, and there might have been more had certain cross-country routes been possible of inclusion; unfortunately, deep water courses ruled some of these roads out of court. An old favourite in Bwlch-y-Groes (Dinas Mawddwy to Bala) constitutes probably the most difficult climb of the week, and it must be agreed that this long and tiring climb is a fair test, for sheer gradient alone will weed out the competitors.

The A.C.U. is noted for its well organised events, and as a result a splendid and representative entry has been received.

Standardisation of Controls.

A LADY recently borrowed a motor cycle, and when about to dismount opened the throttle instead of closing it, with the result that she swerved on to the pavement and crashed through a shop window. This accident, which caused serious injury, again brings to the front a point upon which we have had much to say in the past, and which has been lately discussed by one of our contributors, viz., the great desirability of standardising the controls of a motor cycle. It may be admitted that to standardise all the controls, including brake and clutch pedals, is not the most simple matter in the world, for a great deal of difference exists in the opinions both of manufacturers and riders as to what arrangement is the best. Some prefer to operate the brake with the heel, others with the toe. In either case, operation should be possible with the other end of the foot still upon the footboard or footrest.

Even if complete standardisation cannot be at present achieved, it should not be beyond the ingenuity of the carburetter makers to come to some agreement in the matter of throttle control. Most controls open inwards, and we can see no reason why all should not do so. When there is a real difference in the method of operation, as, for instance, when the American twist grip is used, no confusion is likely to result, but when levers are similarly placed and alike in appearance, although a rider may be able to operate them satisfactorily as a general thing, in a sudden emergency the difference is forgotten, and the lever moved in the direction to which the rider is accustomed, and sometimes with the most unfortunate results, for the machine, instead of slowing down, dashes forward, and, before this can be corrected, an accident may have happened, the results of which may be serious.

We have urged continually that manufacturers should look upon this matter in a more serious manner than they appear to do. It is high time some definite steps were taken.

An Index to the advertisements in this issue will be found on the page facing the back cover.

IS PILLION RIDING DANGEROUS?

A Selection of Letters from Readers who say "No."

THIS is a question which is agitating the minds of many individuals, and legislation may be introduced to prohibit the use of the carrier for passenger carrying. We have never recommended the practice, but we realise that more is being made of the so-called dangers of pillion riding than is justifiable, and also that there is a vast coterie of our readers who find the single track machine suitable for two persons. The following are a selection of the letters we have received this week from such riders, and we invite those having the opposite views to express them in order that the motor cycle world shall judge whether pillion riding is so dangerous to render legislation necessary.

A skilled driver and experienced passenger can go safely wherever the solo rider can, as shown by riders who are negotiating a fairly deep water splash.

Sir,—I would like to add my quota to the series of letters brought into being in answer to Mr. A. C. Robbins's indictment of pillion riding. My mount is primarily solo, being but 2¾ h.p., but the majority of my riding, both town and country, is with a passenger. My usual passengers, namely, my mother and sister, prefer the "flapper bracket" of my machine to the sidecar attached to a 4 h.p. of the same make, which we also own.

I have just returned from a run to Dawlish, roughly ninety miles either way, on the outward journey of which I took a pal on the carrier, doing the journey in four hours, including seven stops, none of which was involuntary. My riding includes many runs of thirty or forty miles, most week-ends, in fact, nearly always two up, and also London and provincial traffic. My monthly average riding is 1,000 miles, over half of which is with a passenger. Incidentally, I prefer riding solo, two up, to driving the sidecar outfit, as there is less strain.

OLD CATHEDRALIAN.

Bristol.

Sir,—"Ixion's" article calls for some comment, as it savours of exaggeration. He may have seen some serious accidents to pillion riders; but the safety of riding like this depends so much on both the driver and passenger that a sweeping statement as to its danger or otherwise is impossible. I have not often taken passengers; but in some cases I refuse to proceed after a hundred yards' trial. With others it is easy to forget that they are there, except for their touch.

With machines whose saddle position is well forward (most new machines have a forward position) the centre of gravity is scarcely altered. Sidecarring is certainly more dangerous. I agree with every word of "Reasonable" and "Live and Let Live."

R.E.C.

Ilfracombe.

Sir,—There have been some very interesting letters in recent numbers on the dangers of taking a passenger on the pillion. While agreeing with much that has been said against the practice, I have never yet seen any attempt to explain any suggestions to eliminate any possible danger. I have done a good deal of pillion riding with my brother, and we are both agreed that, in many respects, it is far preferable to sidecar work. I give here what I consider to be the most important points to render this practice less dangerous:—

1. Brakes in the best possible working order.
2. A spring seat which is laterally rigid.
3. Foothoards sufficiently long for the passenger to use.
4. Never take anyone side saddle.
5. If the passenger requires to hold on, some convenient device can be secured to the saddle-pillar, but on no account must the passenger obstruct the free movement of the driver's arms.

When I am riding with my brother on the back we conform to all the above details, except that we are so accustomed to this mode of travelling that we do not require to hold on. In the event of a temporarily tight corner a grip with the knees on the rider's saddle is sufficient. We have done 220 miles in a day in this way without discomfort.

The following are the advantages to be gained by pillion riding:

1. It is easier to communicate with the passenger.
2. It is cheaper in every way.
3. It is far easier to store a solo mount.
4. There is no strain on the hands as with a combination.
5. When riding on a bumpy surface the tendency for the back wheel to bounce is reduced very appreciably.

My machine was a standard Lea-Francis, two speeds, clutch, and kick-starter. I have only had two sideslips on this machine, and both of them were when going slowly. In one case I was riding alone, and finished up gracefully with the machine on top of me. The other time I had my brother on the back, and, although we turned right round in the road our combined efforts succeeded in keeping the machine from falling. I may state that we are both careful riders, but all the same an occasional dust up is enjoyed.

I have gone into the subject at length, and if you can print this, I think we may hear the unbiased opinions of many who can speak from practical experience.

L. ELLIS.

Sir,—Being a motor cyclist of twelve years' standing, I feel I cannot keep out of this discussion.

My contention is that with an experienced rider, a suitable machine, and a passenger who is not nervous, pillion riding is far safer than a sidecar in the hands of a comparative novice. I have done a good many thousands of miles in this fashion, and though I have been in some tight corners I have never had a smash yet; and some of those incidents would inevitably have resulted in a smash if a sidecar had been attached, owing to its greater width. The points I would emphasise are:

1. Do not try to average more than about 18 m.p.h.; at every corner and cross road always be expecting to meet that other fellow on the wrong side.
2. Do not be content with the rear brake unless it skids the back wheel even with two up. Remember that brake blocks of different compositions have widely varying coefficients of friction. In my experience, a good rear brake will pull up more quickly with a passenger than when solo. *Keep* the brake in that state of efficiency.
3. Nervous motor cyclists or nervous passengers, stay at home and play croquet.
4. A heavy machine is much better for this purpose than a light one. I ride a 6 h.p. twin. It climbs hills nearly as well with a passenger as when solo, and I ask nothing better than its steering qualities.

Finally, I would ask those people who have tried and are frightened of it, or who have not tried and consequently know nothing about it, to keep their opinions to themselves. I am sorry to see Mr. Karslake voicing the opinions of the lay press: I am afraid that he is not so young as he was.

GRADUATE.

High Wycombe.

OCCASIONAL COMMENTS

BY "IXION"

Engines that do not Knock.

IT may be news to readers that there are now engines on the road which *never* knock. I rode a sample last week-end. It was very badly carboned, and had a high top gear. Its owner instructed me to try and make it knock. I tried every trick I could think of, but neither by letting it run itself to a standstill up steep gradients, nor asking it to accomplish impossible pick-ups round sharp corners, could I extract even the mildest pinking sound from the engine, much less the good old hammer and anvil concussion with which we were all so familiar a few years ago. Is there a secret underlying this phenomenon? If not, why are some engines still liable to this excruciating sin? The test engine mentioned above will peter out without any audible symptoms of distress, though the snatch of its dying impluses is, of course, perceptible.

Rained Out.

ON the day when the heat wave broke, I had to leave my machine in the open in what a native described as a "lil' lew spot," by which he apparently meant a sheltered corner. When I wanted to return home, the engine quite pardonably refused to start. I am not ashamed to confess that I hate being "rained out." Most motor cycles will stand twenty-four hours of continuous rain without a misfire, provided they are kept on the move, for the heat of the engine and the wind of motion combine to save any sensitive items from getting drowned. But they all dislike being left standing in a downpour, and my faithful old 'bus is no exception. The chief disagreeableness of the position is that you cannot be quite sure what is the matter. Probably the sparking plugs are wet, and the current is shorting down the outside of the damp insulation, but it is conceivable that the magneto is wet internally, that the contact breaker arm is stuck up, or even that the carburetter is half full of water. Worst of all, there may be no shelter handy in which to conduct research work, and the rider is probably sopped through, so that he makes everything still wetter in his attempts to effect a cure. My pet engine starts from cold at the first kick when all is well. I gave it three kicks for luck, and then cautiously unearthed my dry handkerchief, and mopped down the sparking plug insulators. Another kick. Nothing doing. I inspected the exterior of the magneto—nothing to indicate that its alleged waterproofness was mere camouflage. Another minute sufficed to verify the freedom of the contact breaker rocker, turn off the petrol tap, drain the float chamber, and refill with petrol. Another kick. Still a heavy silence. Removed both sparking plugs, retired under a bush, and dried them very thoroughly. Dried the high-tension cables, and saw that they were not fouling any metal. Replaced everything. Another kick. Still no signs of life.

I began to feel rather puzzled. Decided to test the plugs, and found neither of them were sparking, though I got a satisfactory shock from both cable ends. Inserted the spare plug in one cylinder, started on that cylinder, and ran it hot. Then changed the dry plug over to the other cylinder, and ran that hot too. Finally took the road on one cylinder, trusting to the engine to dry one of the wet plugs. After a mile I changed the plugs round again, and within a hundred yards the second plug ceased shorting, and all was well. Moral: Carry two spare plugs in wet weather, even if you use Lodge racers.

Some Insurance Extras and Economies.

NOW that the cost of repairs has increased in proportion to the rise in prime costs, it doubly behoves all motor cyclists to insure. The abominable condition of so many roads and the letting loose of thousands of inexperienced riders on our highways afford additional arguments in favour of taking out a policy. The average rider is apt to chance his luck and is grossly ignorant of the details of insurance, so a few notes on the subject may set some of the careless ones thinking it over. The average premium for full protection of a 3½ h.p. machine is about £3. Typical extras include 30s. for pillion riding (significant, this!); 24s. extra if the machine is regularly used for business purposes; 10s. extra if the owner allows other people to ride it, or if it is listed at over £100. On the other hand, companies allow generous reductions in the premium if the insured person bears the small claims himself. Thus full cover costs but 30s. per annum if the owner bears the first £10 of all claims; should he make no claim in the first year, the second year's premium is reduced to 27s., and so on. Full cover includes legal expenses under a variety of conditions, and, of course, unlimited indemnity in respect of claims by the public, which might conceivably reach £1,000 in a single collision. No man of small means should ride uninsured.

Tandems, Pillions, and Luggage.

A CORRESPONDENT raises the question as to whether there is any difference in principle between the steering of (*a*) a tandem push bicycle, (*b*) a motor bicycle with a flapper on the bracket, and (*c*) a motor bicycle with heavy luggage on the carrier. The answers are surely obvious. With a tandem bicycle both passengers are well inside the wheelbase. Should a violent alteration in the steering direction (deliberate or involuntary) cause the machine to pivot on the point where the back tyre makes contact with the road, there is no weight behind this point to add extra leverage. But with a pair of motor cycling pillion riders under similar conditions, there is this extra leverage behind the pivoting point; and, unless the flapper has a cool head and knows

Occasional Comments.—

her job, the extra weight will also wobble about, and not exert a definite or continuous leverage. So far as luggage is concerned, the question is purely one of weight. Quite an ordinary flapper will weigh 120 lb., but he is "some" tourist who carries 120 lb. of luggage on the carrier. In any case, the luggage is safer, because it cannot clutch, scream, or wobble when an awkward situation develops.

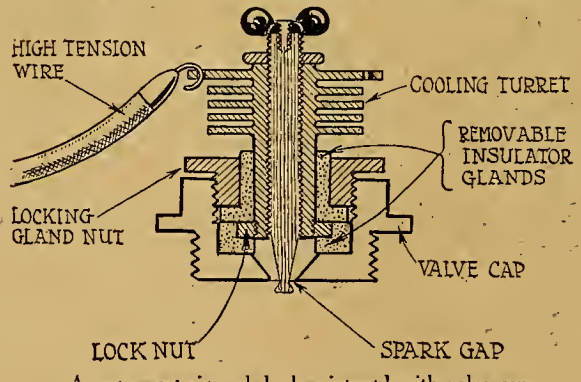
Pillions—the Point at Issue.

I THINK many of our correspondents have missed the real point at issue in this heated controversy. There is absolutely no question but that many fine riders can cover 10,000 miles per annum for many years with a heavy passenger on the carrier and never encounter a smash. On the other hand, the presence of the passenger unquestionably renders a machine more difficult to control, especially in emergencies; and the proof is that the resultant fatalities are attracting the notice of the authorities. We British believe in freedom, and the community does not put its members under restrictions without urgent cause. When due cause is shown, we establish embargos. For example, we forbid stout, short-sighted old women to become pilots. Surely the point now at issue is whether the risks of pillion riding for novices and for the average rider who never emerges from the "half-skilled" stage are so great that experts should be forbidden to carry passengers on their brackets. This issue will not be settled by so many dashing youngsters stating their pillion mileage without accident, or so many middle-aged fogeys telling lurid yarns of how they fractured Aunt Susan's skull. It is useless to burk facts. If the Government notice that accidents are becoming very common, the dashing youngster will have to bear the loss of part of his liberty with a good grace. Some of our younger riders fail to realise what duffers many motor cyclists are. Last week, for example, two solo riders were killed as the direct result of punctures. Some of us have sustained literally hundreds of punctures at express train speeds; but we were never in any danger of killing ourselves through them. This illustration indicates how the personal skill of a rider affects the whole natter. In any case the agitation is inspired by solicitude for the "dud" riders; and the "dud" riders, be it remembered, are the backbone of the industry.

Permanent Plug Design.

A Suggested Design for Permanency and Perfection.

WITH an ordinary low compression touring engine, sparking plug troubles are of comparatively rare occurrence; but, on the other hand, many high-speed modern engines, and indeed many small two-strokes, are positive gluttons as regards their plug consumption. I have in my possession a wonderful assortment of practically new plugs, all of them quite sound, so far as outward appearances go: relics of a somewhat oily two-stroke and of a modern flat twin, which no longer grace the garage. All these plugs, however—probably three or four pounds' worth—are useless. Some leak slightly, with the result that an overdose of oil leads to their immediately sooting up, the oil following the leak; others are broken down as regards their insulation: a condition which is very easily reached when a plug is used in an oily engine. Still others are unreliable or will not spark, the secret of their failure being securely welded up in the inaccessible recesses of their interiors. What I have long yearned for is a plug that will come adrift: a plug with accessible and renewable members: a plug with gap adjustable from without while the engine is running, for the purpose of obtaining the best gap and for freeing the points of soot, etc.: a plug that will not pre-ignite: and withal a plug offering some degree of permanency. The plug is the only component which is not made as a permanency. Why? We are given little hot knobbly bits, bought, to be sure, at a reasonable figure; but why have to scrap the whole plug and buy a new one simply because so minute a defect has rendered it inoperative? Moreover, a properly designed plug should act as a heat dissipater, rather than a heat retainer.



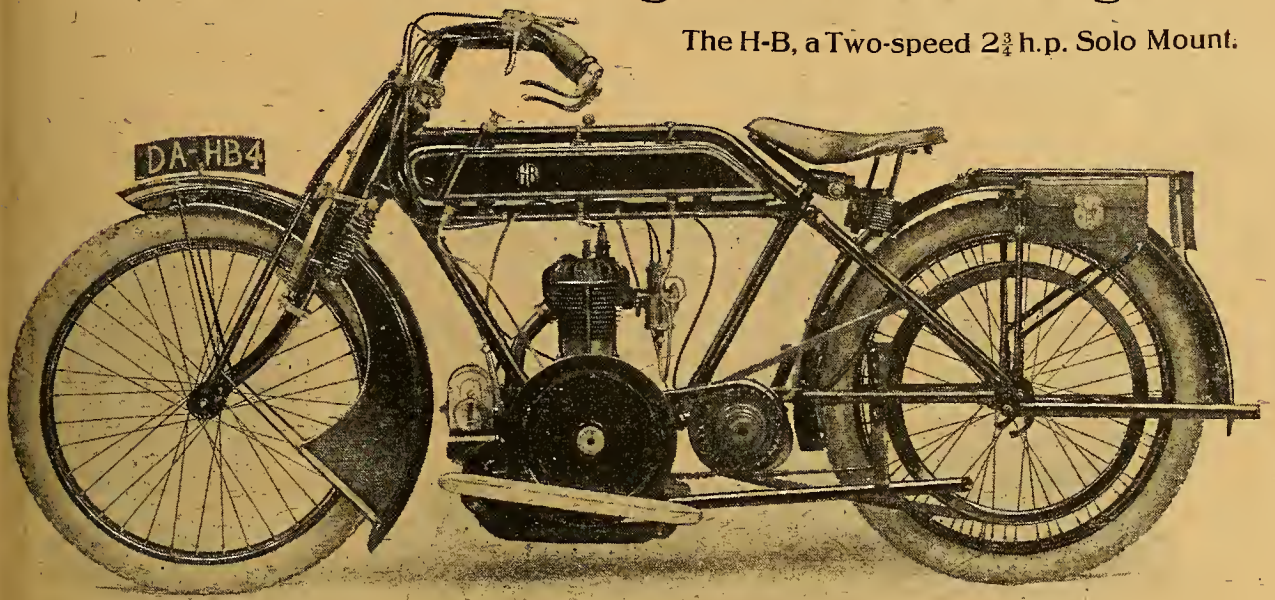
A permanent air-cooled plug, integral with valve cap. It is suggested that a plug on these lines would give more permanent wear and cooler running, besides being adjustable from without, easily accessible, and its components easily renewable.

The accompanying suggested design, which may serve to convey the general basis of the idea, offers, it is claimed, several desired features. Detail design may be poor: that only the plug manufacturers know, but the general principle of the idea is workable. All the parts are solidly constructed. The whole thing could be taken to bits in a few seconds, cleaned, and, if necessary, the insulators renewed. The central electrode is provided with adequate cooling provision, thus defeating pre-ignition, the gap is adjustable, and the simplicity of design renders such a component easily adaptable to quantity production. The valve cap would, of course, go with the plug, being, as it were, the same unit. Tough insulating materials, possessing slight yield, would be used; and, in my opinion, such a plug would, with cheap renewals, last a very considerable time, and give immunity from the majority of the plug troubles experienced with many engines to-day.

CHINOOK.

A New Blackburne-engined Medium Weight.

The H-B, a Two-speed 2¾ h.p. Solo Mount.



The 2¾ h.p. H-B motor cycle fitted with a Blackburne engine, the bore and stroke of which are 71 × 88 mm. = 350 c.c.

A NEW medium-weight machine has made its appearance in the 2¾ h.p. H-B, which two letters may be taken to mean either Hill-Blackburne or Hill Bros., the makers of the machine, whose address is Walsall Street, Wolverhampton—a town already famous for motor cycles of the first water. With the idea that there is a large market for a machine of medium weight, and constructed more sturdily than the average lightweight, and yet not so heavy as the 3½ h.p. single, the makers have set out to design the H-B.

The power unit is the well-known 2¾ h.p. Blackburne engine, 71×88 mm., giving a capacity of 350 c.c., the chief points of interest of which being, of course, the outside flywheel and the detachable head. We were particularly impressed by the smooth exterior finish of the cylinder casting and crank case, the engine as a whole presenting the most compact and neat appearance.

The design of the silencer, etc., is somewhat unusual, in that it is carried, together with the tail pipe, within a neat sub-frame composed of the footboards attached to curved struts, as shown in the accompanying photograph. In future models we understand an undershield will be incorporated with this frame.

The two-speed gear box is neatly housed below the bottom bracket, and is of well-known make, the change speed lever being mounted on a lug on the frame tube below the tank, and fitted with a patent spring selector device concealed in the end of this lug. The drive is conveyed by ¼in. Coventry chain from the engine to the gear box, which is fitted with a very substantial kick starter and hand-operated Ferodo-lined clutch. From this point the transmission is effected by ¾in. Dunlop belt over a 7in. pulley to the rear wheels. Great care has been taken to build the two chain sprockets in line with the rear hub, which gives the whole machine a very symmetrical appearance.

Frame and Fittings.

The frame is of conventional design, considerably reinforced in the front down tube, into which two D tubes have been pressed. The head itself is lined with heavy gauge tube, while the rear stays are straight throughout their length.

The rear wheel is easily detachable by reason of the slots in the fork ends, which slope downwards and thus facilitate the dropping out of the wheel. The rear brake acts on the front side of the belt rim, and is therefore not disturbed when removing the back wheel.

The tank has a capacity of one and a half gallons of petrol and one quart of oil, and is of attractive design, being wedge-shaped and finished black with a broad gold line.

A Brooks saddle is fitted, and toolbags by the same maker are attached to the carrier in neat metal cases.

The mudguards are wider than those usually found on mediumweight machines, and are almost flat in section, the front guard being fitted with a wide mud flap to prevent splash off the road reaching the rider.

During a visit to the works we had a short trial run on the machine, which was found to be very handy in traffic and remarkably quiet, and at the same time speedy on the level.

BORES AND STROKES.

THAT a few millimetres on the bore more greatly increases the capacity of a cylinder than the same extra millimetres on the stroke is not realised by many novices, who would make rapid guesswork calculations regarding the respective capacities of several engines. Frequently we have heard these newcomers to the pastime argue that there is very little difference between 85 mm. bore × 88 mm. stroke and 88 mm. bore × 85 mm. stroke. The difference is 18 c.c. in favour of the latter, as the respective capacities are as follow (bore mentioned first in each case) :

85×88 mm.=499 c.c.
88×85 mm.=517 c.c.

The differences are more noticeable, however, when the bore-stroke ratios are narrower or wider. For example, a cylinder 50 mm. × 60 mm. bore and stroke has a capacity of 141 c.c., while one 60 mm. × 50 mm. gives 170 c.c.

If we take another example, with 50 and 90 as the figures, we obtain the figures given below :

Bore and stroke.	Capacity.
50×90 mm.	=177 c.c.
90×50 mm.	=318 c.c.

When one looks at a millimetre on a rule, it seems incredible that such a small increase or decrease should make so appreciable a difference.

Even in small cylinders, one millimetre in the bore makes a marked difference, as the following figures show :

Bore and stroke.	Capacity.
50×50 mm.	= 98 c.c.
51×50 mm.	=102 c.c.
52×50 mm.	=106 c.c.
53×50 mm.	=110 c.c.
54×50 mm.	=114 c.c.

From the above, it will be seen that every millimetre added to the bore increases the capacity by 4 c.c., but as the increase is continued the capacity increases in ever growing proportions.

It may be taken as a general rule that one millimetre on the bore is approximately equal to two on the stroke.

How to Win Gold Medals in Reliability Trials.

The following hints have been prepared by an experienced rider, who has won innumerable medals in all the first-class competitions.

Know your machine.
Study the regulations.
Arrowing is never flawless, therefore study the route thoroughly.
Practise lightning gear-changing and re-starting on stiff gradients.
Have confidence.

THE novice is apt to imagine that a Six Days gold medal is merely a matter of entering a standard machine, and enjoying the same freedom from stoppages to which he has grown accustomed in his ordinary riding. No greater blunder can be imagined. For one thing, a Six Days route and time schedule are severe enough to rank as equal to 5,000 miles of ordinary touring. It follows that some small trouble is more than likely to occur. In ordinary touring, a rider will generally look over his machine at a stop, and may often find some nut which has worked a trifle loose. He tightens it up, and no harm is done. In a Six Days he has no such opportunities. The nut, if it shakes loose, drops off, and consequential damages occur. He is not allowed to purchase a spare, and the loss of a tiny part may render the machine difficult to handle, cause a tumble in a tight corner, and cost him "condition marks" at the finish. For these and other reasons, the winning of a gold medal in any first-class reliability trial is a serious undertaking, and will mean real hard work. Considerations of space limit the advice which I am able to offer, but all the main points will be covered in outline.

Know your Machine.

1. Enter a machine which is not too new and not too old. You will be hard pressed to keep inside maximum time on the more difficult sections, and must be able to make lightning repairs and adjustments if the need arises. Previous experience in changing a valve spring, adjusting a chain, replacing a twin-cylinder inlet pipe, and other routine jobs, may make all the difference between a special prize and an "also ran." Deftness in tyre repairs is a *sine qua non*. The covers should be as heavy as possible, and should have been run 250 miles: far enough to make the beads supple without wearing down the tread. A spare inner tube, preferably butt-ended, should be carried, together with a gaiter for the repair of bad gashes in the cover. Carry but few spare parts; do not forget a small assortment of nuts and bolts, and pack the tool-bags very carefully.

Study the Regulations.

2. In every trial a number of failings are due to sheer ignorance of the regulations. The beginner usually contrives to misunderstand the schedule time clauses. The secretary will send you an advance copy of the rules, and you should have them at your fingers' ends before the start.

Study the Route.

3. Timekeeping is quite the toughest part of the modern trial. You see from the rules that you are required to average a set speed, say 18 m.p.h., and you jump to the foolish conclusion that this will be easy. Along certain sections of the route it will be absurdly easy; along other sections it can only be done by facing quite unaccustomed risks. The trials routes of to-day follow the most forbidding tracks, where few riders bent on pleasure would dream of venturing. It is not easy to average 18 m.p.h. along such tracks under any conditions, since stiff gradients, crowded with other riders, slow you down to a trifling speed for considerable distances, whilst successions of bad

How to Win Gold Medals in Reliability Trials.—

corners and continuous rough going render speed equally unpleasant on the level and downhill pieces. If grease and a puncture are added to these handicaps, it may take a very good man indeed to finish a section inside maximum time. On the other hand, high speed over bad going racks the machine very severely, and also rattles the nerves of an inexpert driver, so that he either takes a toss, or muddles a hill-climb, or fumbles the repair of a tyre. Preliminary study of a half-inch map is invaluable. First mark out the route with red ink, and then indicate the controls in black ink. Where a section includes plenty of main roads in flattish country, there will be no need to "blind," and along such sections the machine can be driven with restraint and confidence. When a section consists exclusively of narrow, third-class roads threading up and down mountains, timekeeping will evidently be a problem. There will probably be at least one such section per day.

On these stretches every second should be treasured as if it were minted gold. Avoid absurd risks, but keep going as fast as possible, opening the throttle wide up straight gradients, and generally cutting matters much finer than is done in touring. Carry the map sheet for each day's route with you: it may prove very handy in refreshing your memory as to where the danger points occur, and will come to your aid if an arrow is missing or overlooked. The marshals' arrowing of the route is very seldom absolutely flawless; and nothing is more harrowing than to arrive at an unmarked road junction with no time to spare, for you cannot tell whether you have over-ridden an arrow, or whether the marshals have failed to mark the turn.

The cautious cornerist approaches the hairpin wide and slowly on low gear, sums its dangers in a thought, and then opens out.

Some Riding Hints.

4. After such a trial the average tourist will find that his driving has become far more dexterous than it used to be. In particular he will have learnt to handle his clutch and gears more skilfully, to take grease fast without coming over, and to keep up his pace over stony tracks along which he formerly crawled. A little preliminary practice in each of these stunts will improve his prospects of a special prize and of securing his gold. Many touring amateurs prefer to time their gear changes for straight, smooth pieces of road, and perform them in very leisurely fashion, looking down at the parts concerned like a beginner learning the typewriter. When the trial gets amongst the freak hills, there is no hope for a gear changer of this type. The surface is probably unspeakable, the corners are atrocious, and a patch of road no larger than an ordinary bedroom floor may contain four machines, all of which are skidding and plunging. Lightning gear changes and delicate clutch work are essential. Clumsiness in this respect can not only forfeit a gold on non-stop sections, but the observers will note it against a man who is in the running for the special prizes, and, in any case, it loses valuable time. The beginner should therefore practise lightning gear changing, restarting on fierce gradients, and fast travelling over rough tracks.

Confidence Essential.

So far as speed over grease and stone is concerned, confidence is the main essential. Ferocious as the advice may sound, 25 m.p.h. is a far safer speed on almost any kind of bad going than 8 m.p.h. I admit that if the machine comes over, the rider may sustain more hurt at the higher speed, but this penalty is by no means certain; the more suddenly a man falls, the less chance he has to stiffen his body: I have been more injured in a side-slip with a push-bicycle than in a 25 m.p.h. tumble from a motor bicycle. But, in any case, it is impossible to steer with perfect steadiness at low speeds on either rough or greasy surfaces, whereas at upwards of 25 m.p.h. the machine has considerable forward momentum, and ploughs masterfully through the slime or the loose metal.

There are two exceptions to this rule of maintaining speed on bad going. Ruts are an obvious exception. No man can drive fast along a deep rut without coming off; and speed along a narrow crown between deepish ruts is dangerous, since a small stone or a moment's inattention may divert the machine into the rut, where the front wheel must presently jam. Rutted sections never last long, and are generally due to timber haulage: they should be taken anyhow—I know nobody who can negotiate them really neatly; a scrambling sort of progress with the feet spread out at low speed is quite common amongst crack riders. The other exception is presented by hairpins on hills. Rain-storms wash the road surface away and gnaw out channels: then the farmer tips a load of broken stone to give his horses footgrip. You cannot take such places fast, even if the radius of the corner permits a fair speed. Your back wheel will tend to spin round on the stones and mud: your steering will be diverted by the stones, and you may skid mildly on the soft bits. The only possible expedient is to change right down on to bottom gear, keep the throttle nearly shut, hold the steering as steady as possible, and hope for the best. Have no anxiety about power; your engine will take any gradient with lots of throttle in reserve, unless you are straddling an over-geared "baby." Keep the pace low, so that your driving tyre has a good chance to grip, and that the plunges of the front wheel do not head you into the hedge. If the surface is of the very worst, the machine will never take the ideal line round the hairpin which you have

How to Win Gold Medals in Reliability Trials.—

picked out with your eye: but since the speed is low, the plunges will not take you into the hedge, and you can straighten out masterfully after each plunge. Have your wrists well inside the handle-bar grips, not above or outside them, and press your wrists down towards the ground as far as possible, so that they tend to resist the plunges of the front wheel. Do not lose your head if the riders in front baulk you—shouting, swearing, and ramming do nobody any good; if the road is absolutely blocked, declutch, throttle down, secure a witness of the baulk (there are sure to be officials about), and restart on the clutch as soon as the road is cleared. It is best to restart exactly where you were stalled, supposing the surface permits; but if the surface is impossible, ask the nearest marshal if you may restart from the nearest patch of hard stuff in sight.

Keep an Eye on the Nuts.

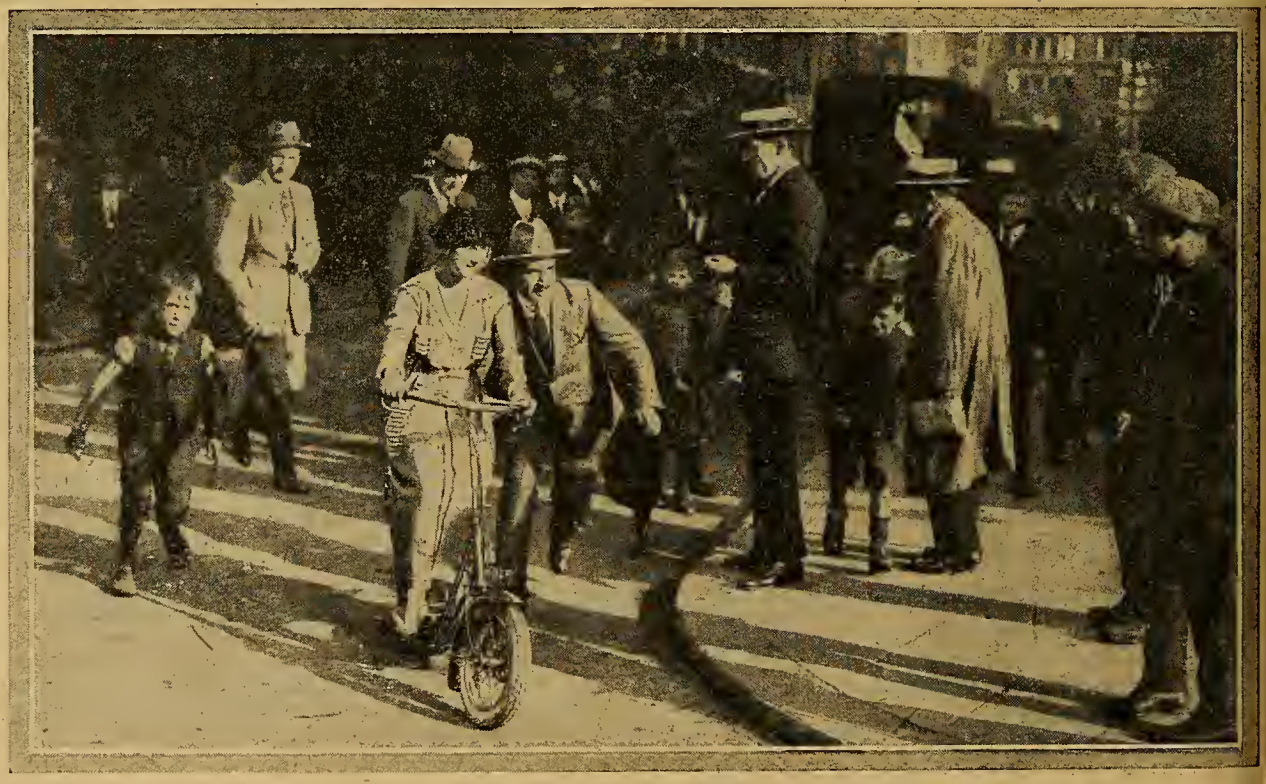
5. During the trial you will occasionally have a few minutes to spare at the side of your machine. Some of the sections are easy, and are included simply to make up the conventional mileage. Some silly riders use such stretches for crawls to an inn or impromptu T.T. work. But these sections furnish the canny rider with golden opportunities to check over the condition of his machine.

6. More gold medals have been lost through tyre troubles than any other cause. The ordinary tourist is fairly competent at tyre repairs so long as he is not hurried. When he is set to mend a tyre feverishly against time, he usually does something foolish. It is very nice when your tyres go through 1,000 miles without smelling the pump, but it is always on the cards that you may gash a cover clean across in these events. More probably you will get a decent sized puncture towards the end of a difficult section, when every moment is vital for timekeeping. A cool head is the great requisite. Stop immediately, for fear of the valve getting pulled out. Get the machine off the road and on its stand as quickly as possible. Turn the wheel and spot the location of the nail. Free as little of the tube as possible. Mend the hole *slowly* and with the utmost care. Let the solution dry right up before applying the patch. Refit the tyre, and roll the bead back before fully inflating, to *see* that the tube is not nipped. In the event of a tube receiving disastrous damage, do not take the wheel out—there are few machines sufficiently well designed for this job to be practicable if a gold medal is to be won. Cut the gashed tube right out, and insert a butt-ender; the tyre makers will rejoin the severed tube for half a crown, and the regulations probably allow you to obtain a second butt-ender as a reserve for the rest of the ride.

ROAD RIDER.

Awards in the Circuit de l'Eure.

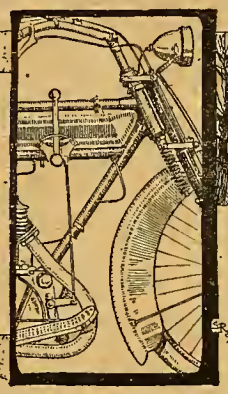
IT is interesting to British motor cyclists and manufacturers to know the value of the prizes won in the important French race Le Circuit de l'Eure. Louis, winner of the 250 c.c. class, takes altogether in money £15, and the M.C.F. gold medal, and a silver medal presented by "Motocyclisme." Milland, first in the 350 c.c. class, takes £11 and gold and silver medals. Péan, who won the 500 c.c. class, gains £17, two gold, and one silver medal. Huret, winner of the sidecar 750 c.c. class, gains £25, one gold, and one silver medal. Houel (Morgan), £25, and gold medal.



The scooter in London traffic. After a few minutes' tuition Miss Lillie, the actress, piloted her scooter through Leicester Square

THE M.C.C. TEAM TRIAL.

List of Competing Teams and the Riders nominated by the Clubs.



AFTER a lapse of five years, the Motor Cycling Club Team Trial for *The Motor Cycle* Cup will take place once more. In the old days it was an event that attracted almost all the clubs of a sporting nature, and this year's revival will no doubt be eagerly anticipated by new riders and also by old hands who have competed every year since the trial was inaugurated in 1904. This year the teams which have entered comprise 90 competitors and 45 passengers. There will be more than 30 reserve riders.

The Motor Cycle challenge cup.

The trial is to be held from Potter's Bar on Saturday next, starting at 1 p.m.

Each rider of the winning team will be presented with a gold medal by the M.C.C., and the members of teams making full scores will be the recipients of silver medals.

Full rules and regulations for the trial were published in *The Motor Cycle* for August 7th, but the following condensation may be of assistance to those who do not happen to be conversant with them.

The cup is to be awarded in competition between teams of riders, members of, and nominated by, recognised automobile and motor cycle clubs.

If the cup be won three times, not necessarily in succession, by the team representing any one club, it shall become the absolute property of that club.

Each team shall consist of six riders, three of whom shall drive solo and the remaining three passenger machines. Lady competitors will not be permitted.

The competition shall consist of a non-stop course, to be covered three times; total distance, 100 miles. The competitor covering each of the three circuits at 20 m.p.h. will gain the maximum number of marks.

Sufficient fuel and oil must be carried for the whole of the trial.

The number of miles accomplished by each rider of each team, without stoppage other than stoppage due to existing traffic, will be added together, and the team scoring the highest mileage that is arrived at shall be the winner, but in the event of more than one team making a full score in mileage the award will be given to the team making the best performance in the consistent driving test.

Unavoidable stoppages due to traffic must be reported, but will not count against the rider. A consistent driving test will be held on the hill which will be ascended on each circuit during the trial.

The following teams will compete:

M.C.C.

Starting Time. H. M. S.	No.	Rider and Machine.
1 0 0 ..	1.	L. A. Baddeley (2¾ Douglas)
1 0 30 ..	2.	E. A. Bridgman (7 Indian sc.)
1 1 0 ..	3.	P. W. Moffat (4 Douglas)
1 1 30 ..	4.	B. A. Hill (8 Morgan)
1 2 0 ..	5.	R. B. Clark (2¾ Douglas)
1 2 30 ..	6.	A. J. Watson (6 Ariel sc.)

CAMBERLEY AND DISTRICT M.C.C.

1 3 0 ..	11.	W. K. Alfold (3½ Ariel)
1 3 30 ..	12.	W. T. Whitty (6 Ariel sc.)
1 4 0 ..	13.	H. F. Owen Evans (3½ Rover)
1 4 30 ..	14.	F. Baker (8 Matchless sc.)
1 5 0 ..	15.	H. J. Clarke (3½ Triumph)
1 5 30 ..	16.	S. Pimm (4 B.S.A.)

Reserves: A. Golder (3½ Ariel) and J. Stocker (3½ Ariel sc.).

EALING AND DISTRICT M.C.C.

1 6 0 ..	21.	K. V. Chidley (2¾ Wooler)
1 6 30 ..	22.	F. H. Douglass (3½ Sunbeam sc.)
1 7 0 ..	23.	L. Pulham (3½ Ariel)
1 7 30 ..	24.	F. A. Longman (7 Harley sc.)
1 8 0 ..	25.	S. A. Lees (8 Zenith)
1 8 30 ..	26.	S. E. Longman (4 Triumph)

Reserves: W. G. Boyer (4 Triumph) and J. J. Hillyer (8 Matchless sc.).

WOOLWICH, PLUMSTEAD AND DISTRICT M.C.

1 9 0 ..	31.	T. J. Ross (4 Triumph)
1 9 30 ..	32.	G. D. Hardee (8 Matchless sc.)
1 10 0 ..	33.	R. Boner (4 Triumph)
1 10 30 ..	34.	F. J. Ellis (8 Matchless sc.)
1 11 0 ..	35.	B. J. Sims (4 Triumph)
1 11 30 ..	36.	C. R. Collier (8 Matchless)

Reserve: S. A. Ive (4 Trinmph).

MIDDLESEX M.C.C.

1 12 0 ..	41.	J. Hillyer (3½ Rover)
1 12 30 ..	42.	E. Pittock (6 James sc.)
1 13 0 ..	43.	D. H. Noble (3½ Rover)
1 13 30 ..	44.	S. A. McCarthy (8 Morgan)
1 14 0 ..	45.	A. C. Robbins (2¾ Wooler)
1 14 30 ..	46.	G. L. Fletcher (4 Douglas sc.)

Reserve: H. Boocock (4 Triumph sc.).

BIRMINGHAM M.C.C.

1 15 0 ..	51.	Bob Duke (3½ Triumph)
1 15 30 ..	52.	H. B. Denley (10 Morgan)
1 16 0 ..	53.	E. Kibble (3½ Triumph)
1 16 30 ..	54.	T. Stevens (4 James sc.)
1 17 0 ..	55.	G. Kuhn (2½ Levis)
1 17 30 ..	56.	T. Silver (3½ Quadrant sc.)

Reserves: G. A. Strange (4 or 6 James), T. H. Pattman (4 Norton), and H. G. S. Ward (4 Triumph).

ESSEX M.C.

1 18 0 ..	61.	F. A. Applebee (4 Blackburne)
1 18 30 ..	62.	E. A. Colliver (7 Indian sc.)
1 19 0 ..	63.	C. Pearson (2¾ Douglas)
1 19 30 ..	64.	S. R. Axford (8 Sunbeam sc.)
1 20 0 ..	65.	F. W. Applehee (4¼ B.S.A.)
1 20 30 ..	66.	C. F. Michel (8 Morgan)

Reserves: W. C. Hemy (2¾ Metro-Tyler) and E. H. Bax (7 Indian).

SHEFFIELD AND HALLAMSHIRE M.C.C.

Starting Time. H. M. S.	No.	Rider and Machine.
1 21 0 ..	71.	B. A. Chapman (3½ Brough)
1 21 30 ..	72.	J. Haslam (4 Douglas sc.)
1 22 0 ..	73.	D. Kaye (4 Triumph)
1 22 30 ..	74.	S. Raynes (6 A.J.S. sc.)
1 23 0 ..	75.	H. Reynolds (4¼ B.S.A.)
1 23 30 ..	76.	S. Sawer (4 Norton sc.)

Reserves: R. Flint (4 Douglas), A. Parker (2¾ Douglas), A. C. Roberts (7 Indian sc.), and J. A. Stacey (8 Matchless sc.).

SOUTH BIRMINGHAM M.C.C.

1 24 0 ..	81.	B. Kershaw (2½ Verus)
1 24 30 ..	82.	G. Dalby (4 Triumph sc.)
1 25 0 ..	83.	A. H. Johnson (2½ Allon)
1 25 30 ..	84.	T. H. Weaver (7 Harley sc.)
1 26 0 ..	85.	L. E. Clulee (2½ Allon)
1 26 30 ..	86.	H. H. Saddington (6 James sc.)

Reserves: E. Boydell (2¼ Velocette) and T. F. Blumfield (6 Ariel sc.).

EASTBOURNE AND DISTRICT M.C.C.

1 27 0 ..	91.	J. Blakemarsh (3½ Norton)
1 27 30 ..	92.	D. Ratcliffe (8 Enfield sc.)
1 28 0 ..	93.	J. Bowles (3½ Zenith)
1 28 30 ..	94.	L. G. Freeland (4 B.S.A. sc.)
1 29 0 ..	95	J. Wratten (4 B.S.A.)
1 29 30 ..	96.	G. Salmon (6 Enfield sc.)

Reserves: —. Pocock (7 Indian), N. C. Goddard (3½ B.S.A.), R. A. Niedermayer (6 Matchless sc.), and C. B. Blackie (——).

PUBLIC SCHOOLS M.C.C.

1 30 0 ..	101.	P. Davey (3½ Norton)
1 30 30 ..	102.	C. D. Wright (7 Harley sc.)
1 31 0 ..	103.	D. W. Bonham-Carter (2¾ Coulson B.)
1 31 30 ..	104.	E. M. P. Boileau (——)
1 32 0 ..	105.	J. A Watson Bourne (4 Blackburne)
1 32 30 ..	106.	R. C. Charlesworth (5 Zenith sc.)

Reserves: V. Dreschfield (4 Triumph) and B. J. Reeves (6 Clyno sc.).

OXFORD M.C.

1 33 0 ..	111.	F. L. K. Loxley (4 Douglas)
1 33 30 ..	112.	C. J. V. Bellamy (4 Douglas sc.)
1 34 0 ..	113.	H. F. Burge (4 Douglas)
1 34 30 ..	114.	H. W. Smith (4 Triumph sc.)
1 35 0 ..	115.	H. G. Watson (4 Triumph)
1 35 30 ..	116.	R. C. Davis (8 Chater-Lea sc.)

Reserve: C. B. C. Loxley (3½ Triumph).

ILKLEY M.C. AND L.C.C.

1 36 0 ..	121.	J. E. Walker (3¾ Scott)
1 36 30 ..	122.	W. R. Haggas (3¾ Scott sc.)
1 37 0 ..	123.	W. Moore (3¾ Scott)
1 37 30 ..	124.	W. L. Guy (3¾ Scott sc.)
1 38 0 ..	125.	H. W. Sellers (3¾ Scott)
1 38 30 ..	126.	W. F. Scott (3¾ Scott sc.)

Reserve: N. O. Vinter (3¾ Scott).

LIVERPOOL M.C.

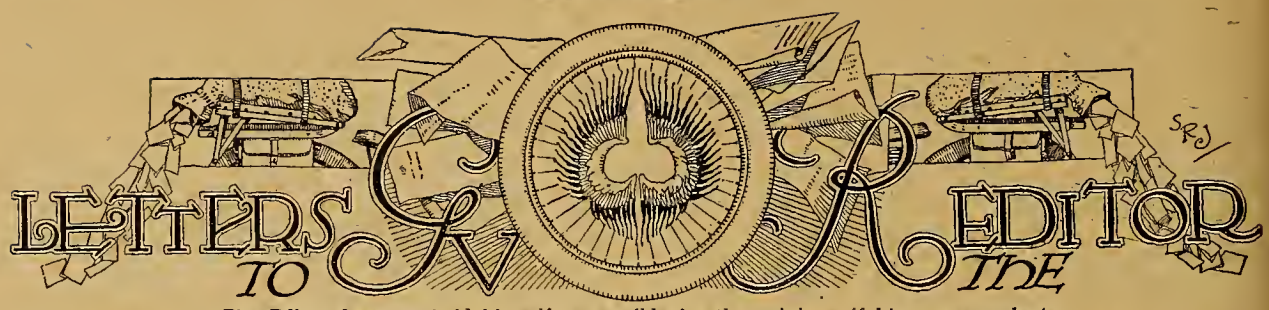
1 39 0 ..	131.	Jack Fox (4¼ B.S.A.)
1 39 30 ..	132.	R. J. Mundy (8 Matchless sc.)
1 40 0 ..	133.	V. E. Horsman (4 Norton)
1 40 30 ..	134.	S. W. Philpott (5 Brough sc.)
1 41 0 ..	135.	S. Parker (——)
1 41 30 ..	136.	Noel H. Brown (7 Indian sc.)

Reserves: F. A. P. Zacharias (4 Triumph), F. Hatton (2¾ Douglas), and O. Wade (6 A.J.S. sc.).

COVENTRY AND WARWICKSHIRE M.C.C.

1 42 0 ..	141.	Sam Wright (3½ Humber)
1 42 30 ..	142.	R. B. Ewens (3½ Rudge Multi)
1 43 0 ..	143.	W. Brandish, jun. (5-6 Rover)
1 43 30 ..	144.	F. G. Edmond (4 Triumph sc.)
1 44 0 ..	145.	H. Finch (4 Triumph sc.)
1 44 30 ..	146.	S. Crawley (4 Triumph sc.)

Reserves: R. B. Bicknell (——), H. Whittem (3½ Humber), B. Ryecroft (4 Triumph sc.), and T. R. Gibbins (4 Rex sc.).



The Editor does not hold himself responsible for the opinions of his correspondents.
All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

FREQUENT PUNCTURES.

Sir,—I was cycling from Darlington to Richmond (Yorks) on August 13th, and between Barton and Richmond, which is six miles, I got no fewer than six punctures in my back tyre—a brand new heavy Dunlop. They were received at regular intervals of about half a mile. I should be pleased if you will publish this in *The Motor Cycle*, as I should like to see if it has ever occurred in such a short distance with any of your readers. NORMAN B. SHALDERS.

PASSAGE TO THE ISLE OF WIGHT.

Sir,—Noticing your correspondent's letter with reference to the above in your issue of the 31st ult., I feel sure it may interest many of your readers to know that by using the Southampton-Cowes route one is not required to empty the petrol tank. Moreover, as the landing at both ends is on to a pontoon pier, there are no awkward inclines to negotiate, and access to the road is quite easy. The crossing takes about fifty minutes. The charges are: Motor cycle, 2s. 6d.; sidecar combination, 5s.; pier toll (Southampton only), 4d. J. L. HEWITT.

SCOOTERS.

Sir,—"T.H.C.'s" excellent letter in your issue of July 10th raises an interesting query.

Is America responsible for the introduction of this type of machine?

At the Stanley show some ten years or so ago a machine was exhibited which was on the lines of the scooter, but of infinitely cleaner design than many of the models illustrated nowadays. This machine—I believe it was called the Max—was illustrated in your journal on more than one occasion, and had, as far as my memory serves me, a single-cylinder engine of 2½ h.p. and a simple form of countershaft drive; the road wheels were very small, and no saddle was fitted.

A reproduction of the illustration would, I think, be of interest. T.R.H.

Grays.

[The illustration of the 2½ h.p. Max—the original scooter—was repeated on page 293, March 27th, 1919.—Ed.]

FUEL CONSUMPTION.

Sir,—Seeing in a recent issue a letter of a rider who got the "astounding" result of 160 miles to the gallon, may I give my experiences.

I have a lightweight Premier, bought about three and a half years ago for £9, date of make unknown. Carburetter, Brown and Barlow original type. Running one day I noticed the petrol being blown back through the air port and wasted, also petrol dripping from the screw plug which holds the jet up. Later I proceeded to make this as near petrol-tight as possible, also put a hot air intake on to trap the "blow back."

Noticing recently that the consumption of petrol seemed low, I emptied the tank and bought a gallon of benzole and used it nearly out. On totting up the mileage, it gave 170, and there was sufficient left for another ten miles. The machine is single-speed, fixed gear, and it has never let me down through engine or other trouble but once (a matter of a few yards).

A man with a small powered motor bicycle has to keep it in tune to get good results, but those with four or five horse-power to throw away do not know when their engines are in tune. Usual disclaimer. R.H.

Birmingham.

AMATEURS IN COMPETITION.

Sir,—I read with much satisfaction the comments of "C.L.W." in your issue of August 7th, with regard to the competition on an equal footing between amateur and professional.

Should it not rather be said an "unequal footing." On the very face of it the procedure may appear to be fair, but surely one has not to look far to perceive the manifest unfairness of mingling promiscuously amateur and professional in one class at club hill-climbs.

Let nothing be done to discourage the professional rider, for he is indispensable to the success of the pastime. Moreover, he will leave no stone unturned to render his machine more efficient, so that the name of the make he represents may be known as the epitome of all that is best in motor cycle construction.

The continuance, however, of the present practice, which I have striven to deprecate, can only result in the gradual disappearance of the real amateur from open competition, and the retention only of the "shamateur"—the exponent, to use the popular phraseology of club reports.

Let us have, therefore, separate classes for amateurs and professionals, if only to popularise the pastime and to admit the real sportsman into open competition, if only *pour encourager les autres*. COUNTERSHAFT.

Malvern.

FACTS CONCERNING THE RECENT WOOLER RECORD.

Sir,—Readers of *The Motor Cycle* may be interested to know, if they have not seen for themselves, that several gross misstatements regarding the achievement of the 2¾ h.p. flat twin Wooler motor cycle in the recent Petrol Consumption Test held by the Ealing and District Motor Cycle Club, have appeared in the press. Other articles, apart from this test, have appeared in well-known papers, which, to put it mildly, are incorrect.

On August 26th an evening paper published the astounding fact (?) that "The induction system on the Wooler machine has nothing to do with the design of the Wooler engine, but is combined with an apparatus for measuring the amount of petrol used on such tests." Ye gods! This is certainly "some" invention (of the journalists).

My motto is, "Give credit where it is due," and I should therefore like it known that the apparatus for measuring the petrol is a thing apart, and not combined in any way with the induction system, which is solely the design and invention of Mr. John Wooler, who designed the entire unit, and it was this unique induction system which proved such a large factor in obtaining the marvellous consumption of 311 m.p.g.

On August 27th further valuable mis-information was given to the public through the medium of a weekly paper, namely, that a system of cantilever frame springing had been invented somewhere in the "Stone age," and that an imitation of this system was now being used on the Wooler machine.

Let me point out as gently as I can that the Wooler springing is not, and never has been, on the cantilever system, so that whoever wrote this interesting piece of news was obviously talking through his hat. What I want to know is, "How long will these inspired writers of fiction be allowed to trouble us?" Their efforts have left me quite weak and

Harrow. PUZZLED (NOT MUZZLED!)

HONOUR TO WHOM HONOUR.

Sir,—I should like to draw the attention of readers of *The Motor Cycle* to the Capacity Tool Co., whose advertisement is to be found in the Miscellaneous Section.

I had tried every likely firm for two exhaust valves for my American Excelsior, receiving the usual reply that none were obtainable, whereupon I sent an old valve to this firm, and received within two days of despatch the articles I required, which were an absolutely perfect fit.

I think this information may be of some use to readers in a like position to myself. I, of course, make the usual disclaimer. S. DALE.

Sir,—In these days of profiteering and bad service it is both surprising and extremely pleasant to find a garage whose owners keep their promises. Some two weeks ago I became in need of some important spare parts. I wrote the makers of my engine, who promised them in four weeks. I then telephoned to Messrs. Young, of Kilburn, who informed me that they would let me have the parts in eight days. I took it for granted that I should be lucky if I got them in a fortnight. Imagine my surprise to find my spares awaiting me at the station within five days of the order being given. Usual disclaimer. S.

Nutfield, Surrey.

Sir,—Some time ago I had an unavoidable smash. I broke my front forks (all the lot), the carburetter control on the handle-bars, the connection to the oil feed, smashed the front mudguard, broke five spokes, and buckled the front wheel. This happened on a Thursday midday. The agent had no stock, so he made a journey to Birmingham the next day (Friday). He had good luck, and started on the job on Saturday morning. The machine was ready for the road the same evening. My machine was a 4¼ h.p. B.S.A.

All this is an appreciation of Mr. J. Bassett, Shelton. Can any reader beat this? CONTENT.

Hanley.

DELIVERY.

Sir,—Being a regular reader of *The Motor Cycle*, I have noticed a good many complaints *re* delivery of new motor cycles, etc., and should be much obliged if you would spare a small space in your valuable paper for this letter, as I think that it is only right that firms who deliver machines quickly should be brought to the public notice.

On August 7th I ordered a new 1919 2¾ h.p. Douglas from the London office in Newman Street, and they told me the delivery would be about three weeks, but exactly eight days from the date of order I received a notice from the railway station that the motor bicycle was ready for collection.

Norbury. L.C.W.

A WARNING.

Sir,—A few weeks ago I motored with my wife to Fleetwood from Lincoln, and after arrival at Fleetwood the inspector examined my motor and sidecar to see if I had any petrol. All being in order, he issued me tickets for the motor and sidecar, costing 8s. 9d. each, total 17s. 6d. He then supervised the loading of the machine. When I reached Belfast the inspector there demanded an extra charge of £1 7s. 6d., although I had my ticket for 17s. 6d., the reason being given that the motor and sidecar should have been detached the one from the other for the 17s. 6d. rate. Another motor cyclist who was bringing his combination in the same boat had to pay the extra also. If the other motor cyclist or myself had known, we should have detached the sidecars from the motor, but there is no way for the public to know this but experience with the company's steamers.

R. MARTIN.

PRICES.

Sir,—I am another reader of *The Motor Cycle* who would like to see greater clarity in makers' advertisements, particularly as to prices.

There is a growing suspicion on the part of many riders that there is some motive in leaving out prices from the advertisements, and the general thought is that it is to give agents and dealers an opportunity to indulge in a little profiteering.

Although I have given up the idea of getting a new combination as hopeless, I am always meeting the agent who has a "practically new 1919 machine—only done 300 miles"—that he can sell at £30 to £50 more than the makers' price, and one wonders sometimes if there is any collusion between the manufacturers and agents encouraging this turning of new into second-hand machines.

Now that it is intended to lift the import restrictions from motors I intend to get a friend in America to send me over an American machine, even if I have to pay the import duty of 33⅓%.

In case I might be called unpatriotic, I would like to mention that I have been recently demobilised after service in France. J. ABBOTT.

STEERING.

Sir,—Further to "Janey's" letter and "Chinook's" remarks on this subject.

For an extended period I rode a 1911 P. and M. solo, and found the steering excellent at all speeds, even with passenger on behind. I never was troubled with any front wheel lifting tendency.

A military Big Four-Norton, on which I rode an average of about fifty miles daily for five months, was exceedingly comfortable, so much so that "hands off" could be indulged in for long stretches

My present mount, a 1918 A.J.S. combination, presents no difficulties, and can be ridden comfortably with one hand.

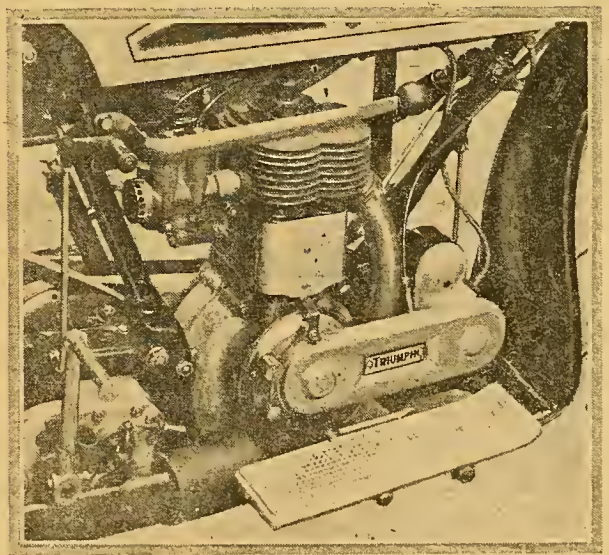
I have had little experience with a Scott, and therefore hesitate to express any opinion. E. OLIVER, Capt.

PRICES AND PRINCIPLE.

Sir,—May I be permitted to endorse the opinion of your contributor—Wm. Turner—on the subject of prices and principle. I, too, put on order an A.B.C. combination early in March at the provisional price of £75, and was told by the agent that deliveries would commence in May. When the price was eventually fixed at £85 I was told the same, that the advance would have to be paid, and even at this date (August 22nd), I have not got a definite price for the sidecar—how it will be upholstered or anything connected with it.

I certainly think it is time the Sopwith Company spoke out, and say if they intend delivery this year or not, as after all the months of waiting, and still no sign of delivery, it certainly makes one very dissatisfied, as I am sure there are plenty of people, like myself, who have no use for a combination in the middle of winter for pleasure.

Sheffield. STILL WAITING.



SPECIAL FITMENTS FOR TRIUMPHS.

These aluminium footboards and valve guards have been introduced by Mr. W. Brandish, Foleshill Road, Coventry, who is marketing them. The photograph also shows the new Sturmey-Archer gear control mounted on the seat tube, which we find from experience an improvement upon the previous design.

Competitors turning on to the road for Birdlip at Cross Hand Inn during the recent Reliability Trial held by the Redditch and District M.C.C., and described in last week's issue.

A WORN FIBRE BRUSH.

Sir,—Being the owner of a Matchless Victory model, I read your photographer's account of his experiences in the Scottish Six Days Trial with much interest.

He asks if any reader has had similar trouble with the magneto to that which he describes. Curiously enough, I had precisely the same thing happen to me last Easter.

The particular J.A.P. engine of my Matchless outfit, I find, is addicted to oil slinging, and I should be interested to know if this is a peculiarity of my engine. If so, what is the remedy? JAS. Q. MILLS.

SPEED WOBBLE.

Sir,—I was much interested in the experience of speed wobble related by "G.E.S." in your issue of August 21st. I notice he asks for a theory on the cause of this. Surely this cause is indicated by "Ixion's" experience with the steering of four different machines. The wobble at high speeds is due to the design of forks and front springing, and only occurs with certain machines. I should be glad to hear other opinions on this subject. C. DONTOCK.

Sir,—Your correspondent "G.E.S." in *The Motor Cycle* of August 21st asks for a good theory on the cause of his speed wobble whilst *doing 60 to 65 m.p.h. on a new Rudge-Multi which he had never ridden before*, and also for the best means to overcome it. I should think the portion in italics answered itself, and now for the best means to "overcome" it (I suppose he means to prevent it). A sure cure for speed wobble is to ride down High Holborn at 60 to 65 m.p.h., and keep straight on until you meet the cure, which is a dead cert for speed wobbles and all other ills.

It is people of the "G.E.S." type who get police traps sprinkled round to catch others doing 21 m.p.h., and I hope his speed wobble taught him a lesson. I sincerely hope he had no pillion passenger. DON PIP.

Beaufort.

OVERHEAD V. SIDE-BY-SIDE VALVES.

Sir,—I have noticed recently in both the technical and non-technical press many articles treating of the design of motor cycle engines, and apparently written, in most cases, by engineers. In the majority of these articles overhead valves are recommended as preferable to the side-by-side type where efficiency is desired, and the decline of the use of overhead valves is commented upon and deplored.

Now that sufficient of the 1919 and 1920 designs have appeared to enable us to judge the present trend of design, this falling off in the use of the overhead valve is certainly very noticeable, especially in view of the war-time experience gained in the manufacture of such valve systems for aero engines, and their undoubted advantages from a purely engineering standpoint. Up to the present the only designs I have seen incorporating both inlet and exhaust valves in the cylinder head are the A.B.C. and the Brough.

My purpose in bringing up this question is to suggest that some of the designers who have hitherto favoured the overhead system and now revert to the side-by-side should give us their reasons for doing so. It would be very interesting to know if the J.A.P. people have any mechanical reasons for discontinuing their famous sporting model, for instance, and why the Indian now appears with the inlet next to the exhaust instead of above it. Much has been said in favour of the overhead system, but I have never yet heard any conclusive arguments in favour of the side-by-side method from either a mechanical or thermal point of view. The old objection that overhead valves could not safely be entrusted to the rider who is not an engineer on account of the liability of the stems to fracture is surely long since out of date. Hence, I am sure that a justification of the side-by-side valve systems from any engineer who has reverted to them would be of great interest to many.

S. LALOUR HORDLE.

SUMMARY OF CORRESPONDENCE.

The motor cyclist who borrowed a plug between Malton and Scarborough on July 31st is anxious to obtain the address of the lender.

A correspondent took a wheel spindle to Reading to have cones fitted for a stranded motor cyclist, but when he returned the man had disappeared, leaving no address. Our correspondent would like to return the spindle.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with "*The Motor Cycle.*"

	Price net.	By post
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle, its care and management. Twentieth Edition. 286 pages. 400 illustrations	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Sixth Edition. (Second Reprint).	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition	2/-	2/3

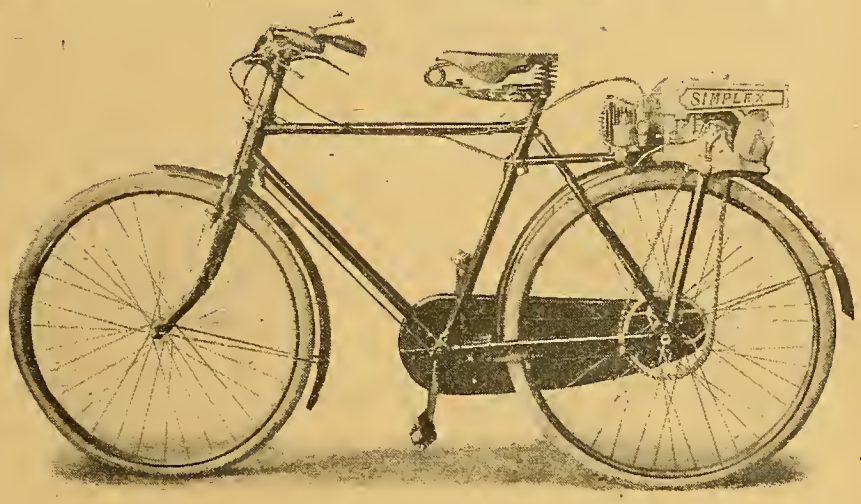
Mechanical Propulsion for Pedal Cycles.

The Simplex Auxiliary Motor—a 1 h.p. Unit with Clutch which weighs 20 lb. complete.

AT least three parts of the British public are interested in motors of one description or another. This is obvious in every city of the kingdom, and we have had the fact brought home to us almost every time we have taken a new machine on the road. Even pre-war models attract attention, while one is almost mobbed by the interested public when a stop is made with a scooter, or other miniature motor cycle of unconventional design.

There is no doubt that a vast number of potential motorists do not, as yet, know exactly what they require—excepting that it must be comparatively cheap. Probably the scooter—especially the type fitted with a seat—has a strong appeal to the man, or woman, who at present owns neither cycle nor motor; but one must admit that the demand at present is somewhat superficial, and many who think they will like scooters know nothing at all about them, and such probable buyers have yet to be educated as to their use, their limits, and their mechanical requirements.



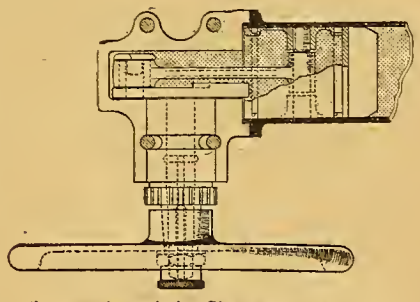
The Simplex auxiliary motor shown fitted to a 22in. frame pedal cycle.

A New Class of Buyer.

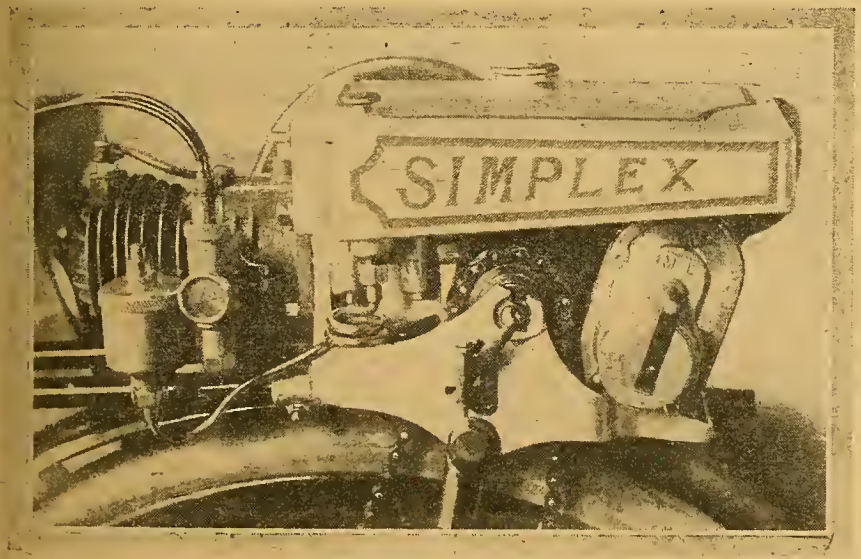
There is, however, a distinct class of potential motorist who does know what he requires. This class is made up of pedal cyclists, who desire some means of mechanical propulsion to enable them to use their existing machines without the fatigue of pedalling. This interest of cyclists in the auxiliary motor was exemplified last week by the crowds that gathered before the windows of Messrs. Henry Garner, Ltd., Hill Street, Birmingham, where the new model Simplex outfit was on view. There was a distinct difference between these crowds and those we have observed when curiosity only has impelled the passer-by to stop. It was obvious that the majority of those who lingered to discuss the proposition regarded the auxiliary motor as something above a novelty.

The Simplex power unit is by no means a new proposition; the designers and manufacturers—the Patrick Engineering Co., Ltd.—have been experimenting with it for the past five years. As far back as November 18th, 1915, page 489, we described it, but since that date many improvements have been made, and the production model now introduced is a thoroughly practical machine which will go a long way to introduce many hundreds of pedal cyclists to the petrol motor.

One feature of this power unit is its multiple-plate clutch, automatically operated in conjunction with the compression release. This is a point which makes for ease of control, as the cyclist has a single lever to stop and disengage his engine. The manner in which this is arranged is decidedly neat, the outer casing of a Bowden wire being connected to the compression release lever, and the inner cable to the clutch operating rod. By raising the lever on the handle-bar the compression release is first opened by the outer cable, taking up its bearing upon the mechanism of the release valve, and then the inner cable functions by pulling the lever pressing the clutch rod.



Plan section of the Simplex piston connecting rod and crankshaft.



The Simplex power unit, the engine of which is a 1 h.p. two-stroke of 104 c.c. This model is fitted with a countershaft clutch.

The only other controls are those of the Amac carburetter, but subsequently a new type of single lever Amac, specially made for the Simplex, will be fitted, thus reducing the entire control to two levers—(1) The compression and clutch releases, and (2) the carburetter. It would be difficult to imagine anything more simple for the most nervous novice in motor propulsion.

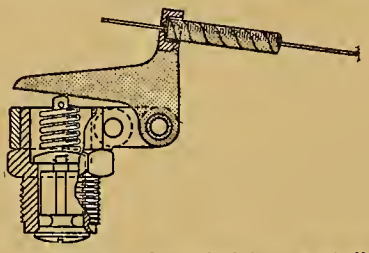
To Fit any Cycle.

Weighing about 20 lb., the Simplex outfit consists of a miniature two-stroke engine, a revolving countershaft clutch, and a Runbaken magneto mounted on an aluminium platform easily attached to any existing pedal cycle, lady's or gentleman's model. Above the unit is a half-gallon tank fixed to the engine at its fore end and to two small lugs on the

Mechanical Propulsion for Pedal Cycles.—

magneto side plates at the rear. By removing the front connection the tank may be swivelled around those on the magneto to afford accessibility for any adjustments which may be found necessary.

The engine is of the conventional three port type of two-stroke, and has a cylinder with a bore and stroke of 51 mm. (104 c.c. capacity). The piston has



The compression release which is automatically operated with the clutch.

two rings, one at the top and another at the bottom, the former being a larger ring than the latter.

The connecting rod is of phosphor bronze, and the crankshaft is of the single-sided variety carried in a long bearing. Outside the crank case, which is of aluminium, the shaft carries a spur gear wheel and flywheel. This spur wheel is the first of a train of three, the second of which drives the revolving clutch, and the third the magneto.

On the opposite end of the clutch member a sprocket or pulley is affixed (for chain or belt drives will be optional), from which the drive is taken down to a sprocket or pulley fixed to the hub of the cycle.

To fix the unit to any bicycle is quite a simple matter. The engine is carried on two longitudinal tubes, along which it may be slid and so adjusted. The two tubes are supported at their inner end by a split lug, which clips the saddle tube. Two stays are used to carry the weight of the unit on the hub spindle ends. These are pivoted at their tops on the aluminium baseplate, and at the lower ends adjusting slots are embodied to enable the driving chain to be adjusted.

Ignition is provided by a miniature Runbaken magneto designed specially for this unit, which was illustrated and described in our issue for June 3rd last. It is a splendidly made little unit of exceedingly low weight; in fact, all the separate parts of the Simplex are good, and it does not strike one that quality has been sacrificed for cheapness.

The Clutch.

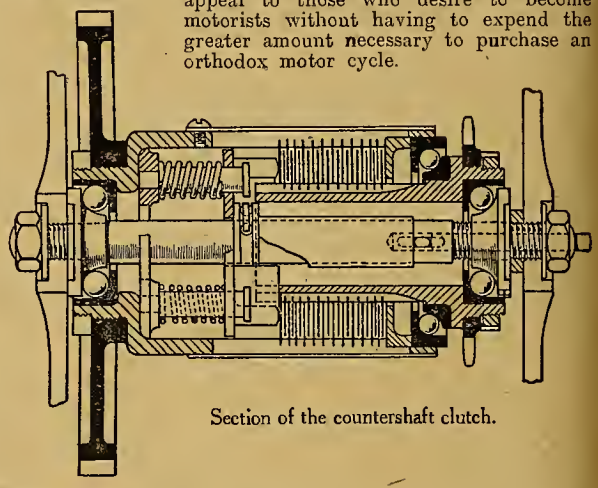
The clutch is a very neat little unit somewhat resembling a motor cycle wheel hub. It is mounted on a fixed spindle, and carried on ball bearings of the cup and cone type, which are adjustable from one end. Briefly, the clutch unit consists of a rotating outer shell carrying the spur wheel by which it is driven, and an inner sleeve embodying the sprocket or pulley for the final drive. The clutch plates are connected alternately to the inner and outer members and are pressed against each other by a number of coil springs. Disengagement is secured by a push rod passing through the centre of the spindle, which is slotted for a cross member operating against a sleeve which compresses the coil springs.

When in engagement the clutch unit revolves on the two main bearings, but when out of engagement the outer shell rotates on the inner member.

Lubrication is by means of the petroil system, a measure being supplied which holds the correct allowance of oil to be added to a tank of petrol. The capacity of the tank is half a gallon, which the makers state is sufficient for eighty miles; but even better results than this have been obtained, and the consumption may be said to be 200 m.p.g.

Interchangeability of Parts.

At present only the single-speed model will be marketed by Messrs. Henry Garner, Ltd., the sole distributers for the British Isles. This decision was reached partly on account of the fact that with the two-speed model which has been undergoing road tests it has not been found necessary to use the second ratio on any main road hill, the little engine being sufficiently powerful to negotiate such hills without pedalling assistance. The shelving of the two-speed unit, too, will facilitate production, and arrangements are well in hand for an output of one hundred per week. Deliveries will commence next month, and the parts of every machine turned out will be interchangeable. The price of the unit is £23, at which price it will make a strong appeal to those who desire to become motorists without having to expend the greater amount necessary to purchase an orthodox motor cycle.



Section of the countershaft clutch.

An Adjustable Sidecar Seat.

Coachbuilt Body with Ample Luggage Capacity; Designed for Occasional Use as Two-seater if required.

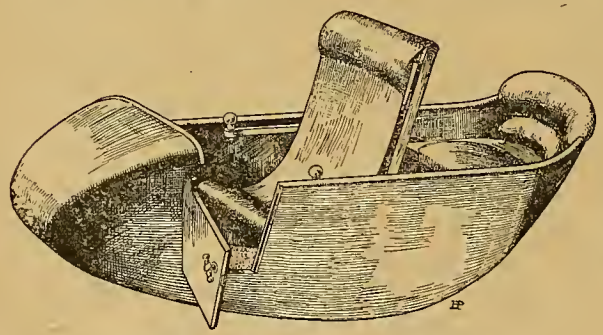
COMFORT for the sidecar passenger is not always so complete as showroom assurances would have us believe, and the fatigue experienced on long journeys may very largely be due to the impossibility of getting the necessary change of position in the usual sidecar seat.

To obviate this, and, further, to secure adequate luggage accommodation or to provide for an occasional extra passenger, a sidecar body with a patented form of movable seat has been designed by Mr. B. Graham Wood, of 44, Clive Place, Penarth, South Wales. The adjustability of the riding position is the chief point of the design, and this is achieved by adopting the hammock style of suspension on deck chair lines, incorporating a leather-cloth seat, partly cushioned and sprung at the top.

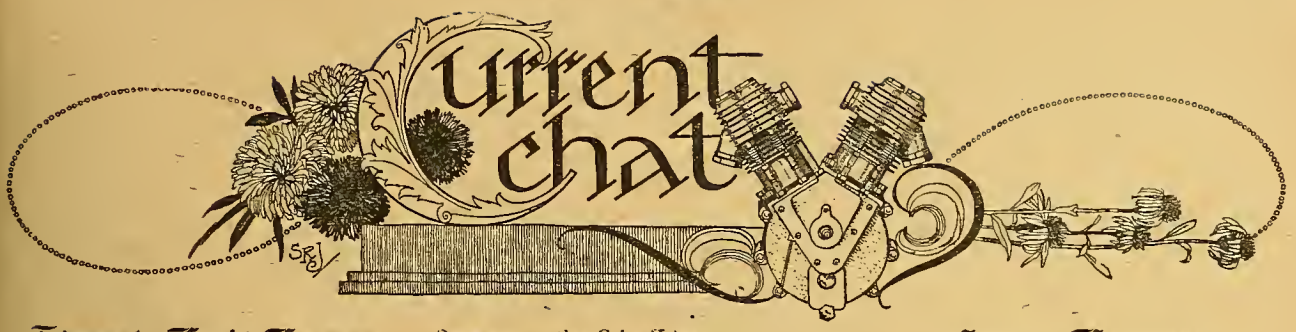
The angle of the seat is altered quite easily by the passenger without rising, the back being tilted by self-locking handles at the sides, working in racks. In the forward position an additional passenger can easily be accommodated in the rear of the body, while if the seat is lowered to get the full reclining attitude, a regulation suit case may still be carried at the rear without inconvenience.

The body is being made in one standardised model only, but a light single-seater may be introduced at a later date. The larger body is no heavier than that of the average touring sidecar, and a further desirable feature is that, owing to the adjustment of the seat, the centre of gravity of the body and passengers is kept in proper relation to the sidecar wheel, whether one person, one person with luggage, or two persons are carried.

In the illustration the back rest is shown in its most upright position, but it is usually lowered to a more luxurious angle.



Wood's patent sidecar body with adjustable seat.



Times to Light Lamps.

SUMMER TIME.

Sept.	4th	... ...	8.40 p.m.
,,	6th	... ...	8.35 ,,
,,	8th	... ...	8.31 ,,
,,	10th	... ...	8.26 ,,

The Club Championship.

On Saturday next the sporting clubs of Great Britain will decide the championship for 1919, by competing in the M.C.C. Team Trial for *The Motor Cycle* cup. The trial starts at 1 p.m. from Potters Bar.

Race for Pedal Cars.

L'Auto is organising a race for pedal-propelled cars—those American toys that encourage the youthful to take an interest in motor construction, and the first stepping-stone to a motor cycle or motor car. The race will take place on September 28th in Paris.

All Test Hills Sampled

Mr. T. W. Loughborough, secretary of the Auto Cycle Union, has returned to London after a month of hill-hunting in South Wales in anticipation of the Six Days Trial (September 15th to 20th, Llandrindod as the centre). He had with him a Morgan Runabout and a 3½ h.p. Sunbeam, with which he climbed every hill included in the course—not perhaps at the first time of asking. He was joined at one period by the Rev E. P. Greenhill, who, as an enthusiast, would no doubt delight in scaling single-figure gradients. The detail arrangements Mr. Loughborough made during his Welsh sojourn should ensure another highly successful event which will bring added credit to the governing body of the pastime.

Traffic Census.

During a recent Sunday an R.A.C. guide at Kenilworth took a census of motor vehicles passing through that town, and his figures show the popularity of the motor cycle over cars in a very marked manner.

	Buses.	Cars.	Motor Cycles. Solo.	Side-car.	Tota
From 10.30 to 1 p.m.	34	36	45	42	87
From 2 p.m. to 8 p.m.		108	97	115	212
Total	34	144	142	157	299

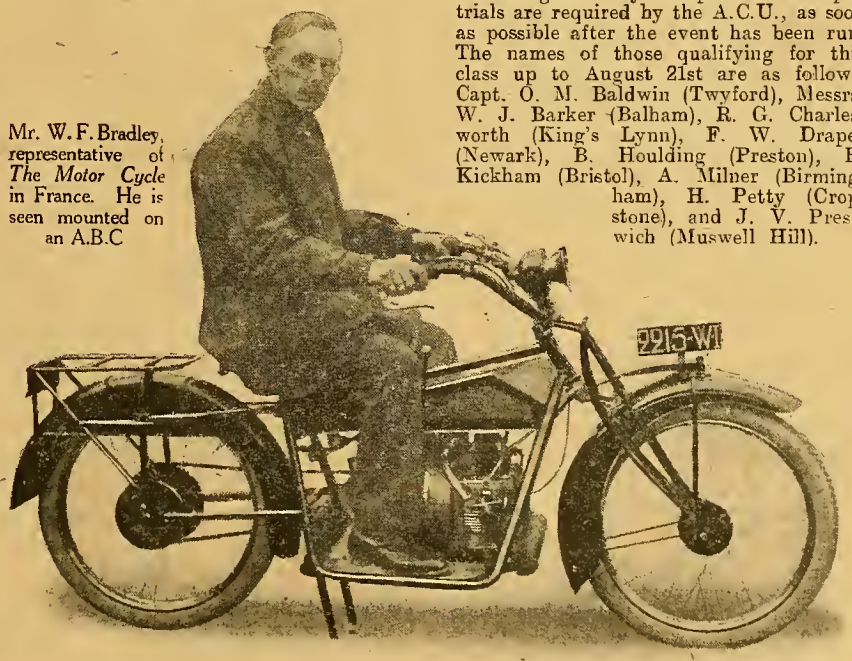
From the above it will be seen that motor cycles exceed the car traffic by over 100%, but the excess of sidecars over solo mounts is not so much as one would expect, considering the large numbers of sidecars on the road.

Designer of the G.L. Killed

We regret to announce that M. Maurice Le Pen, the designer and engineer of the G.L., a French sidecar combination that did so well in the Circuit de l'Eure (described on August 21st), is dead. He was killed in a motor car accident on the 18th inst., when returning to Paris from the sea. M. Le Pen was driving a car in which were his wife and two brothers. The lamps were burning badly, so he was following another car with good lights. Suddenly one of the tyres of the leading car burst, and the car was stopped. M. Le Pen drove his car into the ditch to avoid the preceding car, and overturned, breaking his neck.

Continental News and "The Motor Cycle."

We have pleasure in announcing that Mr. F. W. Bradley has been appointed Continental correspondent of *The Motor Cycle* and *The Autocar*. In 1914 Mr. Bradley was attached to the British Army as a voluntary motor driver, and also served as an ambulance driver on the Italian Front. Later he was put in charge of the American Air Service transportation, and remained in the American Flying Corps until the Armistice. Mr. Bradley is a car owner and a motor cyclist. He has ridden various makes of machines, including 7 h.p. American twins.



Mr. W. F. Bradley, representative of *The Motor Cycle* in France. He is seen mounted on an A.B.C

Special Features.

HOW TO WIN GOLD MEDALS IN RELIABILITY TRIALS

PILLION RIDING.

SIX DAYS TRIAL NOTES.

Hill-climb in Switzerland

The results of a hill-climb at Monte Bré, Lugano, on the frontiers of Switzerland and Italy, are as follow: Motor bicycles.—250 c.c. class, Alfter (Condor); 500 c.c. class, Rossi (Motosacoche). Sidecars.—500 c.c. Gex (Motosacoche). The climb was nearly five miles in length, and the fastest time was 9m. 5s.

Douglases in the Circuit des Quatre Departements.

A team of five Douglases has been entered for the Circuit des Quatre Departements to be held in the Loire district of France on September 1st. The rules, etc., of this competition are similar to those of the Paris-Rheims-Paris event, and the distance is 195 miles.

Experts.

During the war the publication of lists of riders coming under the expert class has of necessity been allowed to lapse. Club secretaries are reminded that, to bring this up to date, full details of the awards gained by competitors in open trials are required by the A.C.U., as soon as possible after the event has been run. The names of those qualifying for this class up to August 21st are as follow: Capt. O. M. Baldwin (Twyford), Messrs. W. J. Barker (Balham), R. G. Charlesworth (King's Lynn), F. W. Draper (Newark), B. Houlding (Preston), E. Kickham (Bristol), A. Milner (Birmingham), H. Petty (Cropstone), and J. V. Prestwich (Muswell Hill).

732 Miles in the Six Days Trials.

This year's Six Days trials of the A.C.U. are to be over a shorter distance than usual. The total week's mileage is 732½, whereas 1,000 miles have been covered in former trials. The Scottish trials in July slightly exceeded this figure.

W.D. Sale in Coventry.

Last week's sale of surplus W.D. 2¾ h.p. Douglas machines in Coventry, the city of motors, savoured of "shipping coals to Newcastle."

Forty-one Douglas lightweights in crates were sold by Messrs. Ashley and Pugh, auctioneers, on Thursday, the 28th ult.

Despite pouring rain, at least two hundred prospective bidders assembled in the sale yard, and the motor cycles were quickly disposed of singly. They were all unissued, overhauled machines, not in the best of condition, and largely minus contact breakers. The prices ranged up to £50 each, the average being £45.

Second-hand Machines.

This week further important provincial sales of motor cycles are to be held. The large number of machines released for auction have done much to relieve the shortage of motor cycles. Coupled with the announcement of the decision to permit imports of motor cycles without restriction (the tariff of 33⅓%, of course, remains for the time being), the auction sales have no doubt had a lot to do with the falling off in the demand for second-hand machines at fictitious values. In any case, high-priced second-hand mounts have had a wonderful run.

The Scott Trials.

In pre-war days, a little coterie of north-country riders of Scott machines made a certain tract of the wild West Yorkshire Moors, their happy (hill) hunting ground, and many unofficial little trials were held thereabouts. The Scott Motor Cycle Co., Ltd., has now organised an open reliability trial over a 100 mile course, having obtained the support of the Manufacturers' Union. It will be held on September 28th. No entry fees will be charged, and competitors will be provided with refreshments. The following cups, trophies, and medals will be awarded:

Amateur.—(a.) The Scott trophy and gold medals (presented by the directors) for the best team of three machines of the same make. (b.) The Kennington Cup (presented by Capt. F. R. Kennington, of London), for the best solo performance.

Trade.—(c.) The Myers Cup and gold medals (presented by E. S. Myers, Esq., Bradford), for the best trade team of three machines. (d.) The Scott Staff Cup (presented by members of the staff) for the best solo performance by a trade rider.

That the course is truly sporting is indicated by the fact that four observed hills, at least thirty miles of mountain road, and three watersplashes are included, and that an average speed of only 17 m.p.h. is expected. From personal knowledge of the course, a map of which will be supplied to entrants immediately, we should say it would require a very expert rider to finish in schedule time.

A.C.U. COMMITTEE'S TRIBUTE.

The members of the Management Committee of the Auto Cycle Union have learnt with feelings of inexpressible regret of the sudden death of their chairman and colleague, Mr. J. R. Nisbet, and in recording their acute sense of personal bereavement wish to testify on behalf of the great body of motor cyclists of the United Kingdom to the high esteem and regard in which he was held by all with whom he came in contact, and to their consciousness of the valuable services which he rendered both to cycling and motor cycling at many critical stages of development, and they now resolve to convey to the members of his family their sincere expressions of deep sympathy in the irreparable loss that has befallen them.

Footboards on Triumphs.

Footboards on Triumphs are not the general rule, and in rainy weather owners of such machines sometimes find that the standard footrests are not quite adequate to keep the feet tolerably dry when wet and mud are encountered. Suitable footboards are not always easy to obtain, and, realising the demand which exists, Mr. W. Brandish, the Triumph agent in Foleshill, near Coventry, has introduced aluminium footrests and a valve guard, which he is fitting to a large number of machines owned by motor cyclists in and around his locality. We illustrate the set on page 253.

New Manager for Harley-Davidsons.

Motor cyclists in general, but more especially those using Harley-Davidson products, will be interested to learn that Lt. Norman Mitchell, R.N.V.R., has been appointed general manager of the Harley-Davidson Motor Co., Ltd., in England. Like many other demobilised officers who have recently obtained appointments in the motor world, Lt. Mitchell has seen heavy fighting, having

Lt. Norman Mitchell, R.N.V.R., A.M.I.E.E.

his first experience in that direction in 1914 and later when he went to Gallipoli.

After being invalided from the latter place he took charge of all new petrol launch engines for some time, and also visited Canada, Australia, and New Zealand as examining engineer for the Colonial Recruiting Board.

Police Trap.

Motor cyclists are advised to exercise care when passing through Frodsham. Riders have recently been fined for not having two independent brakes in good order and for absence of rear lights.

Stile Cop Results.

The official results of the Stile Cop hill-climb held by the Birmingham M.C.C. are as published last week. Gold medals were awarded to G. Dance (3½ Sunbeam) for the acceleration test, fastest time of the day, and best performance on formula; and to H. Morgan (10 Morgan) for fastest time in passenger class.

Motor Cyclists and Benzole.

The arrangements for the A.C.U. Six Days trial, which is to begin on Monday, the 15th inst., include the provision for competitors, who so elect, to use home-produced benzole.

The National Benzole Association is offering a cash prize, in each of the ten classes, for the highest miles per gallon on N.B.A. specification benzole. This specification has the support of the recognised motor users' organisations. The official specification is as under:

1. Specific gravity: .870 to .885.
2. Distillation test (by flask). Benzole shall give a distillate of not less than 75% to 80% at 100° C., 90% at 120° C., and 100% at 125° C.
3. Sulphur: The total sulphur shall not exceed 0.40%.
4. The benzole shall be entirely free from water.
5. Colour: Water white.
6. Rectification test: 90 c.c. of the sample shaken with 10 c.c. of 90% sulphuric acid for five minutes should not give more than a light brown colour to the acid layer.
7. Benzole shall be entirely free from acids, alkalis, and sulphuretted hydrogen.
8. Benzole shall not freeze at 25° F. below the freezing point of water (*i.e.*, until it is subjected to a temperature of 7° or —14° C.).

For Immediate Delivery!

One of the scooters used in the first scooter race organised by *The Motor Cycle* last June is offered by its owner for sale at the modest figure of £85! That figure was paid for it at a time when daily paper enthusiasm for scooters caused many manufacturers to look into scooter claims and "test" the only available machines for themselves.

A 5,000 Mile Benzole Test for Motor Cycles.

Following on the regret we expressed at the omission of the motor cycle from the test of benzole suggested by *The Autocar*, and to be carried out by the Automobile Association, we now learn that an air-cooled motor cycle with sidecar will also be placed under observation, using benzole as a fuel. The machine, a new one, will be taken down at the works before the test, and a careful examination made by a competent authority.

After re-erection, the tour of 5,000 miles will be undertaken, and a careful record taken during the tour of consistency in running, and average fuel consumption per mile, etc.

At the end of the trial the engine will be dismantled and a thorough examination made, as to any deleterious effect on any part of the engine, tank, or carburetter.

The beginning of the test will be made from London, the date of which will be announced very shortly.

THE A.C.U. SIX DAYS' TRIAL.

A 732½ Mile Course. Time Table of First Competitors.

WE publish below the full route of the Six Days Trial, to be held from September 15th to 20th. This year the course selected passes through some of the most beautiful scenery in Great Britain. It includes hills, which, although familiar to many, will be of a sufficiently sporting nature to cut down riders' marks if judgment be lacking when these gradients are tackled.

The actual course occupies five days, the sixth day being devoted to examination of finishing condition of machines.

With the detailed route given below is the time-table of the first man, showing lunch stops, and other information essential for competitors.

A SIX DAYS TIT-BIT.

On Bwlch-y-Groes. This hill rises 1,200 feet in less than two miles, and has a poor surface, with awkward gulleys cutting the road at right angles.

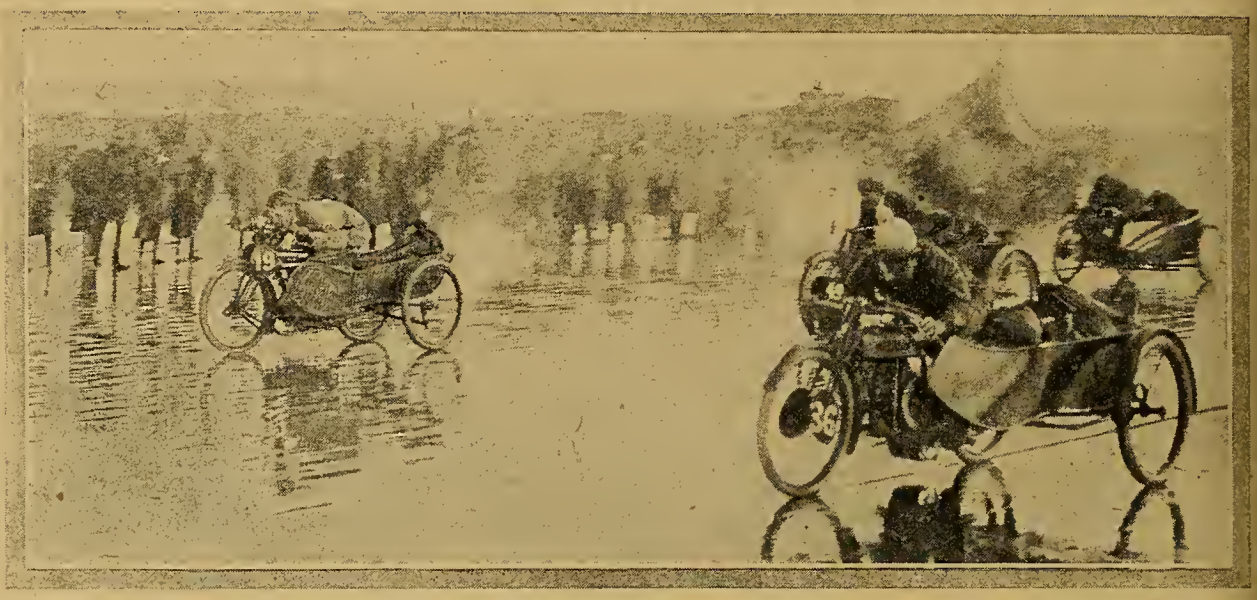
LATEST ENTRIES IN SIX DAYS.

IN addition to the entries named in last week's issue are the following, bringing up the entry to 112.

J. T. Lawler (3½ Sunbeam); R. Brown (3½ Sunbeam); W. R. Eadington (3½ Sunbeam); L. C. M. Davies (Velocette); E. Bottomley (7-9 Harley-Davidson); W. Edwards (4¼ B.S.A.); J. Edwards (3½ Humber); S. T. Ashby (Connaught); Lloyd Motor and Engineering Co., Ltd., L. A. Bees (L.M.C.); H. Peak (7-9 Harley-Davidson); Douglas Motors, Ltd., H. Sharpe (4 Douglas sc.), W. B. Gibb (2¾ Douglas), T. W. Moffatt (3½ Douglas), F. G. Ball (2¾ Douglas); M. Isaac (3¼ Rover); M. Davies (3½ Sunbeam); S. Parker (8 Enfield).

WESTON-SUPER-MARE SPEED TRIALS.

Motor Cycle Racing under Difficulties; Successful Meeting in Spite of Bad Weather.



The start of the sidecar class. The two foremost competitors are riders of an A.J.S. and a Douglas.

A DRIVING westerly wind and heavy rain marred to a great extent the speed trials organised by the Bristol M.C.C. at Weston-super-Mare on Saturday last. The trials were held over a one-mile stretch on the sands at this seaside resort, the course being marked off by flag posts and danger signs in the centre portion and held clear at the finishing and starting points by the local police with the help of railings of ropes and posts. Despite the bad weather conditions, however, the speed trials were attended by considerable crowds of people, and enthusiasm reached a high pitch at the conclusion of some of the events. Apart from the rain and wind, the only trouble experienced by the organisers was the partial over-running of the course by the crowd at the finishing line, due to the fact that the enclosure posts and ropes sunk over in the rain-sodden sand and made the work of the officials and police an additionally heavy one in avoiding accidents.

Success of the Lightweights.

The trials were run off in seventeen classes, with a total entry list of 137 competitors, of which 66% were entered by members of the Bristol M.C.C. Considering that, in practically every race, each competitor was riding all-out in the teeth of a head wind and heavy rain, the following results will be additionally interesting :

CLASS 1.—SOLO MACHINES NOT EXCEEDING 250 C.C.—W. A. Jacobs (1½ Singer, 248 c.c.), walk over.

CLASS 2.—SOLO MACHINES NOT EXCEEDING 275 C.C.—G. F. Tozer (2½ O.K., 275 c.c.), walk over.

CLASS 3.—SOLO MACHINES NOT EXCEEDING 350 C.C.—(1) S. L. Bailey (2¾ Douglas, 350 c.c.), time 1m. 3⅘s. =57.0 m.p.h.; (2) F. G. Ball (2¾ Douglas, 350 c.c.) (3) G. S. Boston (2¾ A.J.S., 349 c.c.).

CLASS 4.—SOLO MACHINES NOT EXCEEDING 500 C.C.—(1) G. Dance (3½ Sunbeam, 499 c.c.), time 1m. 4s.= 56.24 m.p.h.; (2) H. N. Walker (3½ Norton, 490 c.c.) (3) F. G. Ball (2¾ Douglas 350 c.c.).

CLASS 5.—SOLO MACHINES, UNLIMITED CAPACITY.—(1) G. Dance (3½ Sunbeam, 499 c.c.), time 57⅘s.= 62.94 m.p.h.; (2) J. Emerson (3 A.B.C., 398 c.c.) (3) S. L. Bailey (2¾ Douglas, 350 c.c.).

CLASS 6.—SIDECAR MACHINES NOT EXCEEDING 350 C.C.—(1) S. L. Bailey (2¾ Douglas, 350 c.c.), time 1m. 16⅘s.=46.9 m.p.h.; (2) F. P. Davies (2¾ Douglas 350 c.c.) (3) C. S. Boston (2¾ A.J.S., 349 c.c.).

CLASS 7.—SIDECAR MACHINES NOT EXCEEDING 500 C.C.—(1) S. L. Bailey (2¾ Douglas, 350 c.c.), time 1m. 15⅘s.=47.6 m.p.h.; (2) E. Kickham (3½ Sunbeam 500 c.c.) (3) F. P. Davies (2¾ Douglas, 350 c.c.).

CLASS 8.—SIDECAR MACHINES OF UNLIMITED CAPACITY.—(1) B. Houlding (7-9 Harley-Davidson, 989 c.c.), time 1m. 10⅘s.=51.3 m.p.h.; (2) V. H. Smith (4 Norton, 633 c.c.); (3) S. A. Marks (7-9 Harley Davidson, 989 c.c.).

CLASS 9.—CYCLECARS OR LIGHT CARS.—(1) T. Gilmore Ellis (10 G.N. Vitesse, 1,087 c.c.), time 1m. 25⅘s.=42.3 m.p.h. (2) H. F. S. Morgan (10 Morgan 980 c.c.).

CLASS 10.—WESTERN COUNTIES' SPEED CHAMPIONSHIP.—(No team entered).

CLASS 11.—SOLO MACHINES NOT EXCEEDING 350 C.C. (Club Class).—(1) S. L. Bailey (2¾ Douglas, 350 c.c.), time 1m. 5⅘s.=54.7 m.p.h.; (2) F. S. Ball (2¾ Douglas, 350 c.c.); (3) F. P. Davies (2¾ Douglas, 350 c.c.).

CLASS 12.—SOLO MACHINES NOT EXCEEDING 600 C.C.—(1) S. L. Bailey (2¾ Douglas, 350 c.c.), time 1m. 2⅘s. =57.3 m.p.h.; (2) C. Sgonina (3½ Norton, 490 c.c.); (3) G. H. Tucker (3½ Rudge-Multi, 499 c.c.).

CLASS 13.—PASSENGER MACHINE CHAMPIONSHIP.—(1) P. Whale (7-9 Harley-Davidson, 989 c.c.), time 1m. 14⅘s.=48.3 m.p.h.; (2) W. C. Parkes (2¾ Douglas 350 c.c.); (3) W. F. Baxter (4 Douglas, 600 c.c.).

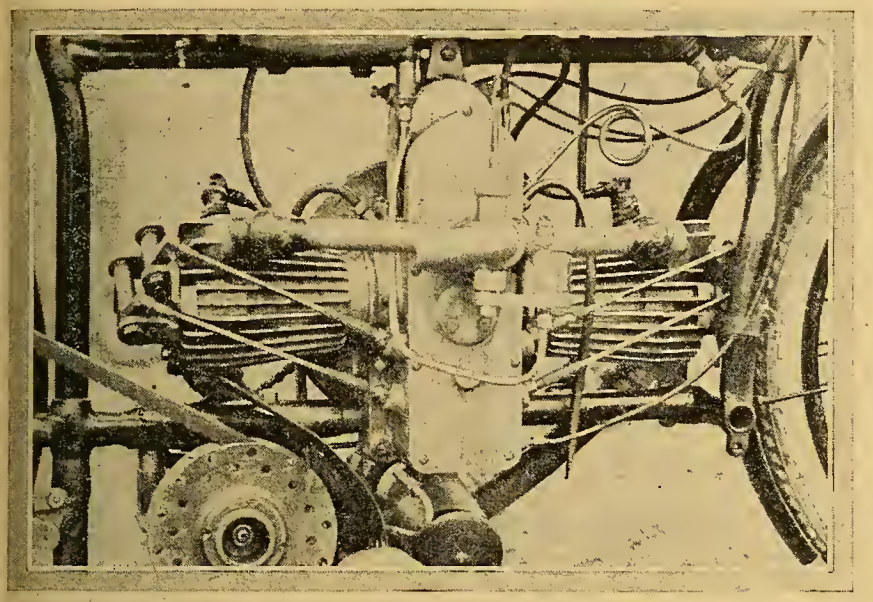
CLASS 14.—SOLO MACHINE NOT EXCEEDING 350 C.C. (CLUB NOVICES).—(1) T. Thompson (2¾ Douglas, 350 c.c.), time 1m. 17⅘s.=46.3 m.p.h.; (2) Capt. M. D. Marcs (2¾ Douglas, 350 c.c.); (3) R. Passey (2¾ Douglas 350 c.c.)

CLASS 15.—SOLO MACHINES NOT EXCEEDING 500 C.C. (CLUB NOVICES).—(1) C. Sgonina (3½ Norton, 490 c.c.), time 1m. 9⅘s.=51.8 m.p.h.; (2) H. W. Walker (3½ Norton, 490 c.c.); (3) Major C. F. Budd (3½ Rover 500 c.c.).

CLASS 16.—SIDECAR MACHINES NOT EXCEEDING 750 C.C. (CLUB NOVICES).—(1) W. F. Baxter (4 Douglas, 600 c.c.), time 1m. 37⅘s.=36.9 m.p.h.; (2) W. C. Parkes (2¾ Douglas, 350 c.c.).

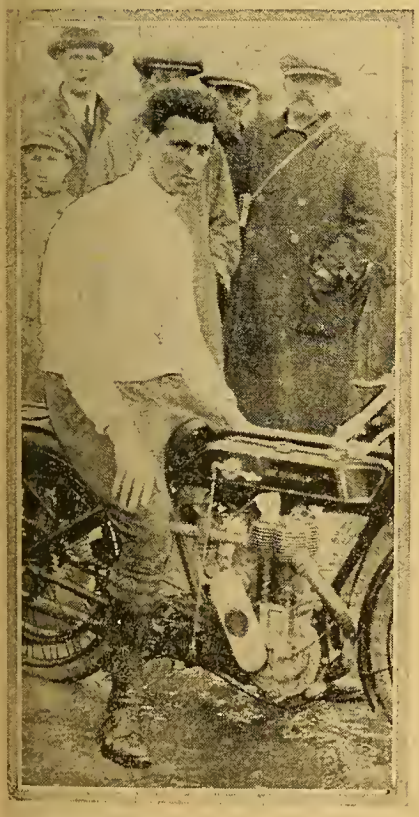
CLASS 17.—SIDECAR MACHINES NOT EXCEEDING 1,100 C.C. (CLUB NOVICES).—P. Whale (7-9 Harley-Davidson, 989 c.c.), time 1m. 54s.=31.6 m.p.h. (walk-over).

Competitors in the final race of Class 3, won by S. L. Bailey (2¾ Douglas)



The racing Douglas engine of F. G. Ball's machine; the special overhead valve gear being immediately noticeable

As will be seen from the above results, the fastest time was made by G. Dance, who rode so well at Stile Cop, on a 3½ Sunbeam in Class 5 at 57⅛s., while S. L. Bailey was the winner in five events on his overhead valve Douglas. The winners in Classes 1, 2, and 17 each had a walk-over, being the only riders to finish over the line. Much interest was aroused in the possibilities of the 3 h.p. A.B.C., and in the splendid acceleration capabilities of this machine ridden by J. Emerson during the preliminary canters prior to the races. Unfortunately, a defective magneto spoilt all chances of Emerson in the event, and practically all the running was done on one cylinder. This machine attained over 70 m.p.h. over the flying mile at Brooklands on the previous Thursday, and 58 m.p.h. at a standing start. A new racing Douglas, with F. G. Ball as the rider, had an engine with aluminium cylinders and four valves in each head—two inlet and two exhaust—each pair being operated by a single overhead rocker and oblique tappet rod from the timing case. This machine had evidently not been tuned to its fullest pitch, according to the results gained in the events. A T.T. Norton, ridden by a private competitor, was fitted with a steel cylinder and overhead valves operated by vertical push rods from the ordinary timing gear. The valve seatings were in one with the head of the cylinder, but the valve pockets are separate and held to the cylinder by an arm and two studs, the whole job being of very neat design.



G. Dance and his 3½ h.p. racing Sunbeam, on which he made a very fine performance, his speed working out at 62·94 m.p.h.

Car v. Motor Cycle.

An interesting feature scheduled in the official programme was the race between an Avro aeroplane, Straker-Squire car, and Douglas motor cycle. They had to make a standing start together from the starting line, the aeroplane having to get off the ground within 500 yards, and finish over the line at a height to clear the spectators' heads, timekeepers' tent, etc., with safety.

To the disappointment of everyone, the two Avros did not reach Weston, and the event was run off eventually between the Straker-Squire and the Douglas alone, the former being the winner of the prize—a silver cup presented by the Hutchinson Tyre Co.

Altogether, four gold, fifteen silver, and nine bronze medals were offered by the B.M.C.C. as prizes, in addition to a ten guinea cup for the best all-round performance on points. The B.M.C.C. and the organisers thereof are to be congratulated on running off a programme in a most satisfactory manner despite the bad weather conditions prevailing.

SPEED TRIAL AND HILL-CLIMB AT ILKLEY.

ON August 24th, the Ilkley M.C. and L.C.C. held their handicap speed trial and hill-climb for the Trade Cup and Dawson Trophy respectively. It was unanimously decided to utilise the system of handicapping in which every member of the club estimates the speed of the competing machines, full particulars as to weights and date of manufacture being supplied by each entrant. An average is taken from these estimates, and the number of the seconds start is arrived at.

The speed trial for the Trade Cup was run off in the morning in the neighbourhood of Blubberhouses, and provided some very exciting racing, every heat having a neck-to-neck finish. Stansfield's Douglas showed a fine turn of speed, just managing to win from Guy's Scott. The results are :

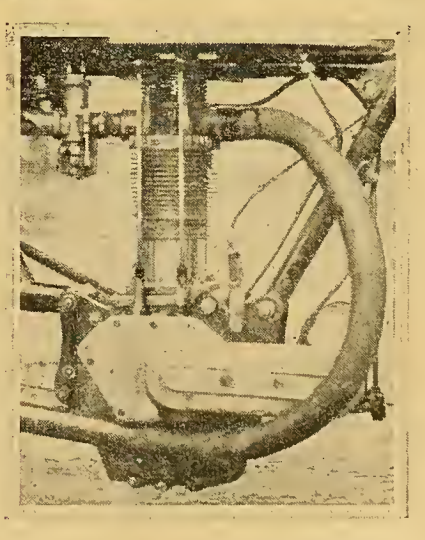
1. J. Stansfield (2¾ Douglas), 4s. start, Trade Cup and gold medal.
2. W. L. Guy (3¾ Scott), 1s. start, silver medal.
3. J. S. Duxbury (4 Triumph), scratch, bronze medal.

After lunch at the George Hotel, Harrogate, the competitors returned for the hill-climb for the Dawson Trophy.

The finishes were even closer than in the speed trial, there being one dead-heat and several wins by less than half a length. The results are :

1. J. S. Duxbury (4 Triumph), scratch, Dawson Cup and gold medal.
2. H. W. Sellers (3¾ Scott), 2s. start, silver medal.
3. F. Marshall (3½ Sunbeam), scratch, bronze medal.

There were only three passenger machines entered, and of these only the Morgan started.



The overhead valve Norton engine fitted to a private owner's machine at Weston.

Wolverhampton M.C.C. Half-day Trial.

100 Mile Inter-club Reliability Run in the Clee Hills and Kidderminster District.

THE Wolverhampton M.C.C. held a comparatively short trial on Saturday afternoon. This was open to members of the following clubs only: Wolverhampton, Birmingham, Coventry and Warwickshire, Sutton Coldfield, and Hereford, but the support which might have been expected was not forthcoming, and of the thirty-odd entrants only twenty-six faced the starter.

Competitors were timed away from West Park, the first man leaving at 1 p.m.

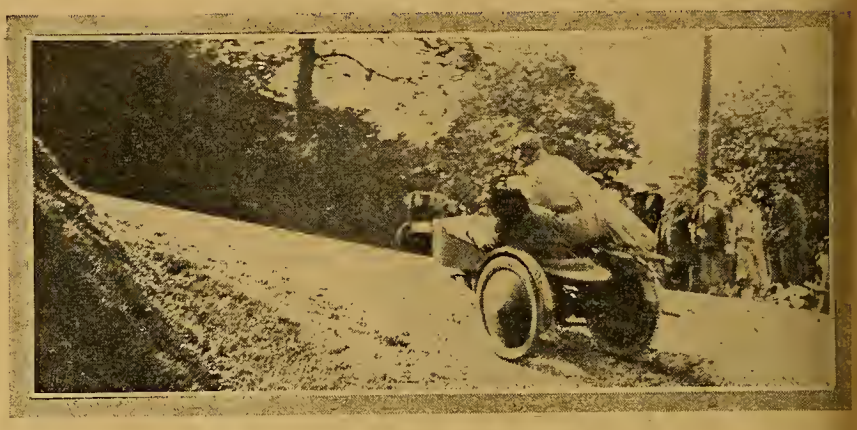
Following the main road through Bridgnorth as far as Burwarton, things appeared to be going very easily, but shortly after this a right turn into a lane took the men into Farlow, and another turn to the right in the village opened on to Farlow Bank. This hill, which is of some little fame, did not cause any particular trouble, and even the lightweights made good climbs. Only two men were penalised to the extent of ten marks, which failure to climb an observed hill entailed, these being T. Davies (2¼ Velocette), who bore the unfortunate number thirteen, and P. Kear, whose resplendent Triumph and aluminium Canoelet sporting sidecar stopped for some reason while going well.

A Combined Test.

A time check was made at the top of Farlow, and thereafter a circuitous course of about twenty miles was followed on the western slopes of Brown Clee Hill.

Near Cleobury Mortimer a combined acceleration and brake test was held. Competitors were stopped, and at the word "go" had to accelerate to a tape one hundred yards away, on crossing which they were to pull up as rapidly as possible. This is a very sound method of introducing a brake test.

The results being decided by formula, it is difficult to name the outstanding performances. Boynton (5-6 James sc.), H. Minton (4¼ Norton), and Brown, on the familiar yellow-disced Sunbeam, were excellent in acceleration and smart on the brakes.



B. Brown (3½ Sunbeam sidecar) taking Farlow Bank at speed.

A little easier going followed until the *pièce de resistance* of the afternoon was reached. This was Flagstaff Hill, near Great Witley, and the steepest part, about 1 in 6 or 7, is faced immediately after a right-angle bend at the foot.

The surface was very loose, and as no control was in operation at the foot, the competitors came up in batches, and some baulking resulted.

Only two sidecar drivers made clean ascents, these being F. W. Giles and E Williams, both on A.J.S. machines. The solo men had less difficulty, being untroubled by the severe wheel slip which stopped the passenger machines. Brown (3½ Sunbeam sc.) made a great attempt to keep going, and would have succeeded but for being badly baulked by Poole (6 A.J.S. sc.), whose wheel refused to grip.

A stopping and restarting test was held at the top of the hill, and most of those who reached it did well. Boynton (5-6 James sc.) was excellent, and Mrs. J. L. Wood (6 A.J.S. sc.), also handled her machine with confidence.

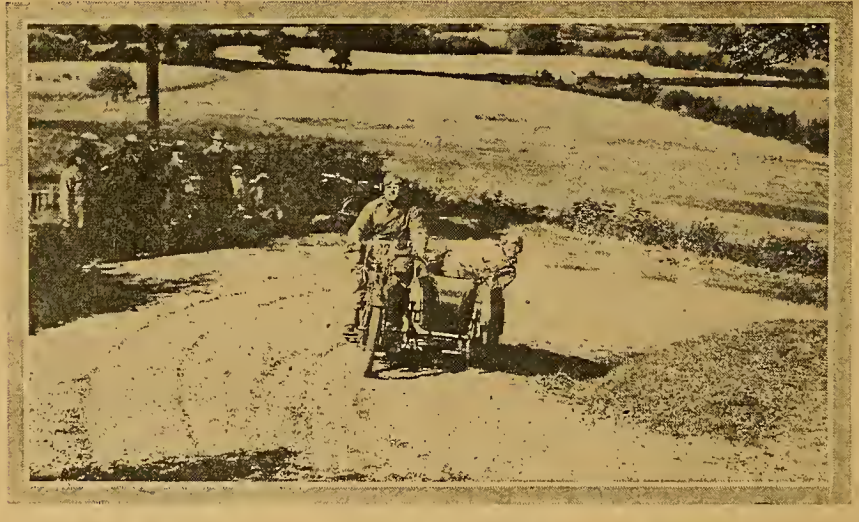
A. H. Mee (2¾ Diamond-Jap) gave up the struggle, his engine emitting terrible

A cinder spreading arrangement fitted on Eric Williams's A.J.S. to prevent wheel slip.

konks through lack of oil; while Edwards (3¼ Lea-Francis), misunderstanding the situation, stopped his engine, and having no kick-starter, was pushed off.

A stop of one and a half hours for tea was arranged at the Hundred House Hotel Great Witley, and there were several non-arrivals.

The homeward run was chiefly over main roads, Gatacre Hill, at Bridgnorth, being scarcely worthy of inclusion. Nineteen competitors checked in at the finish, but the number on time at the tea stop was very small. Owing to Mr. J. E. Greenwood, the trials secretary, not having recovered from his accident at Stile Cop, the results were not determined at once.



On Farlow Bank. H. Boynton (5-6 James sidecar), whose consistent performances and passenger's happy smile are well known in Midland trials.

Club News

Woolwich M.C.

The official results of the recent inter-club team trial are as follow: Cup winners, Streatham and District M.C.; special medal, A. Ilsley (8 Matchless sc.).

Langley Park and District M.C.C.

The hon. scc. of this newly-formed club desires to get into communication with local motor cyclists who are interested in club life. His name is Mr. J. T. Vickers, 15, Frederick Street, Meadowfield, Durham.

Luton and South Beds A.C.

Mr. J. Simpson, the hon. secretary of the above club, is prepared to accept late entries for the club's speed trials, on Saturday next, up to to-morrow, the 5th. His address is 440, Hitchin Road, Luton. The speed trials will be held on the 13th.

Warrington M.C.

The above-mentioned club recently held a non-stop trial over a 60-mile course. The prize winners were as follow:

	Total error.
1. S. W. Philpott (6 Brough sc.) ..	4s.
2. H. Aldred (3½ Norton)	18s.
3. W. N. Pearn (2¾ A.J.S.)	26s.

Bristol Speed Trials.

The winner of the silver cup given by the club for the best performance of the day in the open classes, based upon number of wins, allowing three points for the first, two for the second, and one for the third, is as under, with runners up shown:

	Points.
S. L. Bailey (2¾ Douglas), 3 firsts, 1 third..	10
G. Dance (3½ Sunbeam), 2 firsts	6
B. Hadding (Harley-Davidson), 1 first	3
W. A. Jacobs (1½ Singer), 1 first	3
G. F. Tozer (2½ O.K.), 1 first	3
T. Gilmore Ellis (10 G.N.), 1 first	3
F. P. Davies (2¾ Douglas), 1 second, 1 third..	3
F. G. Ball (2¾ Douglas), 1 second, 1 third ..	3

Oxford M.C.

The Oxford Motor Club recently held its first trial between Deddington and Aynho, the test being that of speed-judging. There were nine starters, and the best performance was that of Dr. H. C. Woodward, who was only 1s. fast over his course of eight miles. Mrs. Wootton was second with 16⅕s. fast, and Councillor E. B. Lewis third with 39s. fast. All the other competitors were slow.

Since the recent first general meeting, some thirty new members have been enrolled. The club, which hopes to be housed in Broad Street, proposes to run meetings every fortnight for the present. The officials are: honorary general secretary, Mr. H. Morton Bailey; honorary assistant general secretary, Mr. W. A. Mathews.

Future Events.

Sept. 4.—Carmarthen M.C. and C.C. Speed Trials at Pendine Sands.
Sept. 6.—Junior Car Club. General Efficiency Trial.
SEPT. 6.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
SEPT. 6.—YORK AND DISTRICT M.C. OPEN HILL-CLIMB AT SUTTON BANK.
Sept. 7.—Widnes M.C.C. Run to Llangollen.
Sept. 13.—N.M.C.F.U. (Wolverhampton). Run to Rudyard Lake.
Sept. 13.—Lincolnshire A.C. Hill-climb.
Sept. 13.—Luton and S. Beds. A.C. Open Speed Trials at Luton Hoo.
Sept. 14.—Manchester M.C. Speed Trials.
SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.
Sept. 19.—Essex M.C. Gymkhana.
Sept. 20.—Blackburn and District M.C.C. Hill-climb on Waddington Fells.
Sept. 27.—Coventry and Warwickshire M.C. Hill-climb.
SEPT. 27.—WOLVERHAMPTON M.C.C. OPEN HILL-CLIMB.
Sept. 27.—Exeter M.C. and J.C.C. Trial.
Sept. 28.—The Scott Sporting Trial.
Sept. 28.—N.M.C.F.U. (Wolverhampton). Run to Crackley Bank, Wellington.
Sept. 28.—Manchester M.C. Closing Run.
Oct. 4.—Essex M.C. Hill-climb.

Widnes M.C.C.

This club is reported as being very satisfactorily supported since its inauguration this year. So far only social runs have been arranged.

Exeter M.C. and J.C.C.

This club recently held a six-hour reliability trial, which proved a most enjoyable and successful event. Out of thirty entries twenty-eight put in an appearance; twenty-six started, and, with but six exceptions, completed the course. The ontward route was *via* Okehampton and Tavistock to Two Bridges, near Princetown (forty-eight miles). This was the only engine stop allowed. The homeward trip was *via* Moretonhampstead, Bovey Tracey, Newton Abbot, Kingsteignton, over Little Haldon, and down Telegraph Hill to Exeter. The course, although not strenuous, was tricky, and included some fine moorland. The roads were in fair condition, except between Two Bridges and Moreton, along which several loose patches were encountered. The most interesting feature of the event was perhaps the variety of two-stroke lightweights in the list, the majority of which successfully completed the course. They included 2¼ h.p. and 2½ h.p. Levises, the former ridden by Mr. Phil Pike. A smart 2½ h.p. two-stroke Chater-Lea, ridden by Mr. T. J. Mooney, the club's secretary, was much admired, and a 2½ h.p. Metro-Tyler, with sidecar and passenger, driven by J. Wood, also completed the course to time without stopping the engine, except for the official stop allowed at Two Bridges. The total course was eighty-four miles, and the officials and committee are to be congratulated on the success of the event.

N.M.C.F.U. (Coventry).

A club rally will be held at Easenhall, near Brinklow, on September 7th. Meet Pool Meadow, 1.30 p.m. Luncheon baskets. Will all members intending to participate in the week-end run to Weston-super-Mare on the 20th and 21st inst. send their names and number in party as early as possible to the hon. sec., Mr. T. Mallalieu, 89, London Road, Coventry, to enable him to secure accommodation.

North Derbyshire M.C.C.

The results of the recent hill-climb at Stone Edge, near Chesterfield, are as follow:

CLASS A.—600 c.c. SOLO, ON TIME.

	Time.	Formula.
1. A. Clay (3½ Triumph) ..	42⅖s.	
2. J. Boult (3½ Norton)	45s.	

CLASS B.—350 c.c. SOLO, ON FORMULA.

1. E. Short (2¾ Douglas) ..	59⅘s. ..	271
2. E. Berresford (2½ J.A.P.) ..	68⅘s. ..	238

CLASS E.—SOLO, UNLIMITED, ON FORMULA, FLYING START.

1. J. Boult (3½ Norton)	36s. ..	561
2. A. Clay (3½ Triumph) ..	35⅘s. ..	526

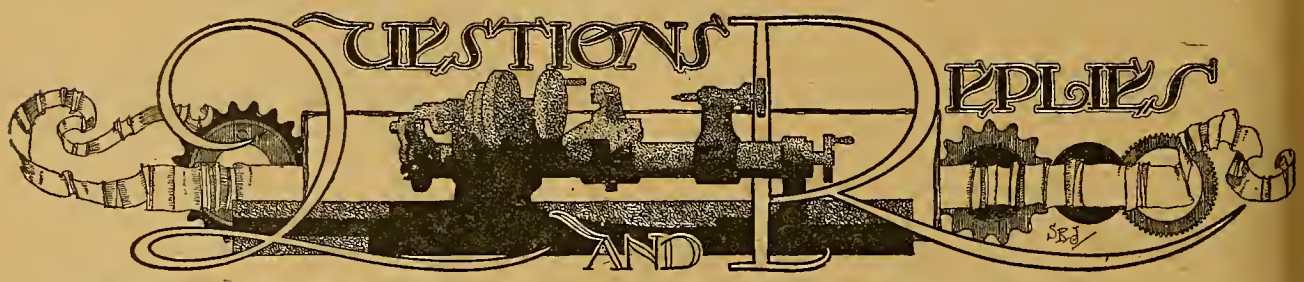
Fastest private owner and winner of Orr Cup. J. Ive (4 Triumph) .. .. 40s.

CLASS F.—UNLIMITED, PASSENGER, ON FORMULA.

1. B. R. Wilkinson (3½ Norton sc.)	67⅘s. ..	297
2. A. Stacey (6 Campion sc.) ..	60⅘s. ..	277

Public Schools M.C.C.

On Saturday afternoon, the members of the Public Schools M.C.C. indulged in a hill-hunting jaunt, during the course of which several stiff climbs were attempted. Leaving the rendezvous at Purley Corner, a pleasant run of eight miles brought the party to the first test, Succombe Hill. R. C. Charlesworth, leading, accomplished the climb with ease, the loose surface of the track, however, causing wheel spin. Davey (3½ Norton), climbing at speed, when within a few yards of the crest, had extraordinary bad luck with excessive belt slip, which eventually brought his machine to a standstill. D. W. Bonham Carter (2¾ Coulson B.) successfully ascended on the second attempt, his previous failure being due to a broken belt. R. Dallas Brown (3½ Rover) also climbed well on his second attempt. H. H. B. Beacon (3½ Zenith) fell a victim to the awkward hairpin bend followed by a severe gradient, which was next encountered; the remaining members, however, were more successful. The "star" hill (Salt Box) was then descended, its loose surface severely testing the braking power of the machines. Ascending this famous hill is an entirely different proposition. Nevertheless, the majority of the riders did well. Descending the hill once more, a pleasant run followed, concluding at Oxted.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle, 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

Artificial Limbs and Motoring.

Is there any clause in the Motor Act to prevent one who has lost both legs above the knee from *(a)* purchasing, *(b)* registering, and *(c)* driving a motor cycle and sidecar? The machine I propose using is all hand-controlled, apart from the rear brake, which I intend having brought up to the near side of the tank and operated by lever.—F.J.G.

There are no qualifications whatever required of applicants for a motor driving licence, therefore you will be able to obtain one. We think, however, that you may find driving a motor cycle for any great distance almost impossible, as in all probability you would suffer very much from vibration.

Damage by Repairers.

I have a 1911 twin Rex with sidecar. I have recently had this down to clean the cylinders, etc., and the machine had been running well after this. One day the machine started running badly, and finally stopped. On trying to restart I could not turn the engine, as it had seized up. I put in some paraffin to free the pistons, but this only allowed them to move a little, so I pushed to the nearest garage. When I returned the machine was outside, and a young lad of about sixteen was shortening the belt. I asked him if it was ready, and he said if I called back in about half an hour it would be, and that he could only get it to fire on one cylinder, and that it had seized up in the back one. As I could not get home that evening I called the next day. The man in charge then showed me the machine with the piston smashed and the cylinder broken. (1.) Do you think I shall be able to compel them to make this good? I know they had freed the piston as I had turned the pulley by hand. (2.) If they refuse, can I sue them in the county court for the damage?—S.G.Y.

In all probability the cause of the engine stoppage was not due to seizure, but to one of the gudgeon pin set screws dropping out and jamming between the connecting rod and flywheels. In the efforts to turn the engine this would no doubt loosen, and after starting up it most likely got beneath the piston, resulting in the breaking of the latter and also the cylinder. If this was the case, we do not think you can place the whole responsibility upon the repairers.

Crank Case Release

I should be extremely obliged if you could advise me on the following points. (1.) My bicycle is a 1919 3½ h.p. Rudge-Multi. When running, a powerful blast of air issues from the cap over the clutch gear. Sometimes this produces a decided whistle, especially when running fast. Should this be so in addition to the crank case air release? (2.) The carburetter (Senspray) chokes the engine when the throttle is opened more than half-way, although it seems to run satisfactorily if the air lever is closed. I have the smallest jet possible for easy starting, viz., thirty-eight jet. Yet the engine runs perfectly, provided the air lever is fully open and throttle less than half-way open.—T.W.B.

(1.) The blast of air which you notice issuing from the clutch is not abnormal, as a certain amount of crank case pressure is released through the hollow shaft in order to permit lubrication of the clutch parts. (2.) The carburetter trouble is rather obscure. We would suggest, however, that you try a larger jet, after fitting which you may find it necessary to lower the petrol level.

Twin Magneto on Single.

I have a Bosch magneto which came off a twin motor cycle. I have a 4¼ h.p. single engine to which I want to fit magneto if possible. (1.) If I use only one carbon brush and remove the other, would this harm the magneto? (2.) Shall I have to remove one of the cams in contact breaker cover? (3.) Will the magneto be powerful enough for a big single? It will throw a spark about ¼in. with turning it by hand and holding the high-tension wire about ¼in. away from magnets. (4.) What alteration is necessary to make a good job?—G.L.P.

(1 and 2.) In using a twin-cylinder magneto on a single-cylinder engine, if you desire to remove one carbon brush completely you must also remove the corresponding cam. (3.) The magneto should be quite satisfactory on the engine you mention.

A scene in a recent open reliability trial held by the Redditch M.C.C. Interested spectators at the hairpin bend on Nap Hill, near Stroud

Contingent Liability.

Will you kindly give me your opinion of the following: I was eighty miles from home recently, and just starting back when I met with a slight accident and had to put the motor cycle into a garage for repairs. I am fully insured against all accidents, but my wife and I had to come home by train. Can I claim my railway expenses from the insurance company, as it is paying for all the damage to the motor cycle?—F.W.W.

The insurance company would not be liable to pay the railway fare of either the insured or his wife as a result of their having to travel home by rail on account of their machine being damaged. No company provides for this contingency in its policies, as presumably it would be open to considerable abuse.

An Old Type Engine.

I have just purchased a Chater-Lea 2½ h.p. J.A.P. engine, B. and B. carburetter, and Bosch magneto. As far as I can gather, the whole thing is dated 1910, or nearly ten years old. The difficulty I am in is to know when to lubricate and the quantity of oil to give. When the tap is turned one way the glass cylinder nearly fills with oil; if turned at a right angle to this position, the oil runs, I presume, to the cylinder. (1.) Is this the way to lubricate? In one position of the tap, when the engine is working, the pump also works, but no oil appears to leave the tank. (2.) Should the tap be turned the other way when running? The man who overhauled the engine calls it a two-stroke, but Messrs. J. A. Prestwich tell me it is a four-stroke. (3.) As the latter is obviously correct, should the magneto be timed to spark at the beginning of the compression stroke and not 10 mm. to 12 mm. in advance? (4.) At the commencement of the compression stroke both valves should be closed. As I can only see the exhaust valve, how can I tell if the inlet valve is closed? (5.) Screwed on the top of the induction pipe is what appears to be a small valve. What is its function?—J.P.J.

(1. and 2.) The oil pump on your machine is evidently one of the old type fitted with a two-way tap. We cannot tell you the exact positions of this tap, as the practice of different makers varies. However, you will find that in one position, on drawing up the pump plunger, oil will enter the barrel. On turning the tap into the second position and depressing the plunger, the oil will be forced through to the crank case. Normally, the tap should be left in this latter position. One pumpful of oil should be given every eight or ten miles, oftener at high speeds. (3.) The engine you describe is apparently the 2½ h.p. four-stroke automatic inlet valve model, and the spark timing will be about correct with the piston 8 mm. from the top of the compression stroke, and the spark fully advanced. (4.) Being an automatic inlet valve engine, you are unable to see the inlet valve because it is contained in the dome above the exhaust valve. However, as the inlet valve works automatically, *i.e.*, without any mechanical operation from the timing gear, you have no need to worry about its timing, as it is always closed except actually during the suction stroke of the engine. (5.) The small valve which you describe as being screwed on the top of the induction pipe is probably to facilitate petrol injection for starting purposes.

Fitting Hub Cups.

Would you kindly favour me with your advice on the following: (1.) I have a 1914 3½ h.p. B.S.A., and am getting a lot of trouble with the back wheel, as the hub cups are badly worn. Would you recommend fitting new hub cups or a new hub? (2.) How are the hub cups fixed in the hub? (3.) Would you give me a few hints on building a new hub into the wheel.—R.H.L.

(1.) It will scarcely be necessary for you to fit a new hub in your B.S.A. back wheel, as the cups are detachable. (2.) The hub cups are pressed into the hub shell, and must be driven out by means of a suitable punch. It is very difficult to remove these, and unless you can place the wheel in the hands of a competent local repairer we would advise you to return it to the makers. (3.) Fitting a new hub would necessitate the entire rebuilding of the wheel, and we do not think you could satisfactorily undertake this yourself.

Enamelling, Gear Changing, etc.

(1.) I have an Indian bicycle and cane torpedo sidecar, which I want to paint red to match. What is the best way of doing this? Would it be better to use red enamel or red paint? Any special dressing first? (2.) Which dressing is better for the paper washer for the crank case joint, gold size or linseed oil? (3.) When using the 1914 Indian two-speed dog clutch gear, is it correct that one can change gear by slamming the lever over without declutching or valve lifting? (4.) What could cause an unsteady acetylene head light? Could lighting the rear light from the same generator cause or affect this?—F.C.F.

(1.) The best thing to use for re-enamelling your Indian and sidecar we think will be Robbialac. Write to Jenson and Nicholson, Robbialac Works, Stratford, London, E.15, for particulars of the various materials they supply for this purpose. (2.) Either gold size or boiled linseed oil is satisfactory as a crank case jointing material. (3.) Your method of gear changing is certainly incorrect. It is absolutely necessary with the Indian two-speed gear that you should declutch when changing, or you may use the valve lifter; but with the Indian type of control it is not exactly a convenient arrangement. (4.) Probably the cause of your unsteady head light is due to the generator not being perfectly clean. We do not think that running the rear light from the same generator would be the cause of the trouble. If necessary, renew the filtering pad immediately beneath the water chamber of the generator, and also examine the connecting tubes to the lamps, as it is quite possible that the flickering is caused by condensed moisture in these.

Carburation.

My 2½ h.p. two-stroke machine normally ran exceedingly well with full air, having a 26 jet (Amac carburetter). After being laid up for four years I recommenced using it again, and as it seemed more powerful I fitted a 25 jet to effect an economy. Recently, after doing a journey, it suddenly refused to take full air, but would run well with the air lever partly open. The carburetter showed signs of flooding, so I cleaned the float chamber and jet, but it still refuses to take full air. Can you explain this?—E.R.W.

The fact that your machine runs perfectly, although you have to keep the air lever closed somewhat, would suggest that there is either some form of stoppage in the petrol supply, or else more air is being admitted in some other way than through the carburetter. Examine carefully the carburetter connections for air leaks; also notice if the drain tap in the crank chamber is open. Although you have cleaned the carburetter, you do not say whether you have cleaned the five spraying jets, which you will find in the carburetter body immediately above the main jet.

READER'S REPLY.

An Early Scott.

Regarding "S.A.R.'s" trouble with the Scott referred to in your issue of the 21st ult., I think he has got the cranks in the wrong crank cases. The one with the left-hand screw should go in the right crank case and the one with the right-hand screw in the left.—EF 343.

RECOMMENDED ROUTES.

DERBY TO CLECKHEATON.—J.H.V.

Derby, Chesterfield, Sheffield, Barnsley, Wakefield, Batley, Birstall, Cleckheaton. Approximately seventy-five miles.

WOLVERHAMPTON TO HERTFORD.—H.G.C.

Wolverhampton, Stourbridge, Bromsgrove, Headless Cross, Alcester, Stratford-on-Avon, Banbury, Buckingham, Winslow, Leighton Buzzard, Dunstable, St. Albans, Hatfield, Hertford.

LONDON TO NEATH.—V.E.J.

NEATH TO BOURNEMOUTH.—V.E.J.

Neath, Bridgend, Cowbridge, Cardiff, Chepstow, Lydney, Newnham, Gloucester, Cirencester, Cricklade, Wootton Bassett, Broad Hinton, Avebury, Upavon, Amesbury, Salisbury, Fordingbridge, Ringwood, Christchurch, Bournemouth.

READING TO LIFTON.—J.W.

Reading, Midgham, Newbury, Hungerford, Marlborough, Beckhampton, Devizes, Seend, Trowbridge, Southwick, Beckington, Frome, Shepton Mallet, Glastonbury, Walton, Greenton, Othery, Durston, Taunton, Wellington, Cullompton, Exeter, Okehampton, Bridestowe, Lifton.

Windscreens while you Wait.

Easting Windscreens, Ltd., will have a representative at Mr. Tom Norton's garage, Llandrindod Wells, during the A.C.U. trials to assist in the expeditious fitting of the Easting windscreen.

An Olympia Show Appointment.

We learn that Mr. C. D. Clayton, the advertisement contractor, has again been appointed as the publicity steward in connection with the forthcoming Olympia Cycle and Motor Cycle Show.

Triumph Specialist.

Mr. H. Stretton Ward, the competition rider, has opened a garage in Leamington under the name of Forfield Motors, where he is specialising in Triumph repairs and spare parts. He was several years with the Triumph Co., and is thoroughly conversant with this well-known machine.

The Rudge Record.

The latest number of the Rudge-Whitworth house journal is to hand, and is a very bright little issue. Therein attention is given to all the organised activities in which Rudge employees may join in their leisure moments. The latest of these is a photographic society, which already has a membership exceeding thirty.

Tan-Sad Extensions.

Owing to the large demand for Tan-Sad pillion seats, the Tan-Sad works have now been moved into larger premises at 9, Freeman Street, Birmingham. The makers wish to emphasise the fact that pillion riding is not nearly so dangerous as it is said to be if the passenger is comfortably mounted on a properly constructed seat, as there is no longer the likelihood of moving the position unexpectedly owing to the discomfort of excessive vibration.

Lightweight in Long-distance Trial.

It is sometimes urged that tiny two-strokes are not capable of maintaining high average speeds when touring.

The performance of Major A. Waters on a Baby Triumph in the recent Irish End-to-end trial is a contradiction of this idea.

Including mileage to and from starting point, his distance was 689¾ miles, covered in running time of 29h. 12m., equalling 23 m.p.h. No troubles were experienced, and the tool-bags remained locked throughout. Petrol consumption was 87 m.p.g.

The Scott Sociable Booklet.

We are in receipt of the Scott Sociable booklet, published by the Scott Autocar Co., Ltd., Clayton Road, Lidget Green, Bradford. In it is to be found a description and technical details of the Scott two-stroke three-wheeled sociable. The first particulars given are quite useful to the reader, as they mention that the vehicle will run on a minimum ground track of 44in., pass through a gateway 55in. wide, will turn in a roadway 13ft. wide, and will pass under headway 52in. high. It seems a pity that the booklet does not include any illustrations. In sending this publication, the Scott Autocar Co. state that they will not be able to give delivery for some considerable time.

A New Lubricating Oil.

Messrs. Blackwell, Victoria Oil Works, Aston, Birmingham, are putting a new lubricating oil on the market. The makers actually claim that this oil will cause no carbon deposit on cylinders or valves. It is made for all classes of engine.

K.L.G. Plugs.

We are informed by Messrs. S. Smith and Sons, Ltd., 175-189, Great Portland Street, London, W.1, that K.L.G. plugs were fitted on the Sunbeam-Coatalen engines of the British airship R34 in her flight across the Atlantic, and that the plugs gave every satisfaction.

The New London Headquarters o Clincher Tyres.

The North British Rubber Co., Ltd., are shortly to move into the extensive premises in Tottenham Court Road, lately occupied by the British Lighting and Ignition Co., who have now moved to Aston, Birmingham. The existing building will be very much extended, and repairs to tyres will be undertaken on the premises.

Booking New Machines.

Maude's Motor Mart, Great Portland Street, London, W.1, are accepting orders for new machines, to be delivered in strict rotation, the number on the waiting list being stated on the receipt for the deposit, which will be returned and the order cancelled at any time should the prospective purchaser desire it. The place cannot be passed on to another, for every machine is booked in the name of the rider who orders it.

Ball Bearings.

Messrs. Rudge-Whitworth, Ltd., Bearing Works, Reddings Lane, Sparkhill, Birmingham, inform us that they are able to supply from stock nearly every standard size of ball bearing and steel balls. These bearings are the product of the plant which the firm established at the urgent request of the Ministry of Munitions. When ordering, the outside and inside diameters and width in inches or millimetres should be given.

The Supply of Piston Rings.

The ordinary garage cannot profitably undertake the tiresome job of making a few odd-sized piston rings in competition with a firm specialising in such machining operations, therefore many repair shop proprietors will be glad to hear that the British Piston Ring Co., Ltd., Holbrook Lane, Coventry, now maintain a stock of rings for immediate delivery in all sizes between 60 to 110 millimetres diameter, graded in ½ mm. steps. The trade mark of this company has been changed from "British-Coventry" to "Brico," and all rings manufactured in future will bear the latter. Special size rings can be made to order in three to six days.

Chater-Lea Spares in Sussex.

Riders of the Chater-Lea No. 7 sidecar machines will be interested to learn that the Endrick Engineering Co., of Crawley, Sussex, are carrying a stock of spares for these machines, as complete as possible under existing circumstances.

Moto-Reve Spare Parts.

We have had several enquiries for Moto-Rêve spare parts recently, and those of our readers who are unable to obtain replacements for these machines will be glad to know that they can get them from the Motor Supply Co., automobile engineers, 223a, High Street, Lewisham, London, S.E.13.

The Rigby Gear.

We are informed that the Rigby gear, which was described in *The Motor Cycle* of May 22nd, 1919, page 512, is now being manufactured by Messrs. Newcombe Brothers, automobile engineers, 10, Zetland Road, Stockton-on-Tees, and is in future to be known as the Simplex.

Fastest Time on Old Tyres.

The majority of competition riders fit new covers before entering a speed event or any other strenuous form of trial, and it is therefore interesting to learn that Mr. Remington, who made fastest time of the day at the recent Southend Speed Trials, used Hutchinson tyres supplied from ordinary stock in 1914, when they were used in several Brooklands events, and have subsequently remained standing idle during the war period.

Sign, or—!

Messrs. Brown Brothers, Ltd., the well-known accessory dealers, inform us that Mr. Arnold, their Australasian representative, took a trade visitor from New Zealand for an aeroplane flight while in this country, and claims to be the first airman to secure an order actually in the air. Whilst at an altitude of between 3,000 and 4,000 feet over London, and travelling at over 100 miles an hour, the passenger signed a substantial order for motor accessories. We sincerely hope Mr. Arnold did not bring intimidation to bear upon his passenger.

Locknuts.

We have received a brochure which ably puts forward the utility of Vislok lock nuts, made by Vislok, Ltd., 3, St. Bride Street, London, E.C.4. Considering that the nuts on motor cycles are liable to vibration, it is often advisable to make use of a suitable lock nut. The Vislok device is most effective in practice, and the nuts are made in all sizes from ¼in. to 4in. in diameter.

British Magneto Developments.

We learn that the M-L Magneto Syndicate, Ltd., and Messrs. S. Smith and Sons (M.A.), Ltd., have entered into an arrangement whereby the latter acquire controlling interests in the former. The manufacture of these well-known British magnetos will still be carried on at Coventry, while the distribution, both to the trade and for export, will be handled solely by S. Smith and Sons. Mr. G. A. Lister, general manager, Mr. A. E. Watson, technical manager, and Dr. Morris, consulting engineer, who have been associated with the M-L since its inception, will continue as members of the Board.

MOTOR CYCLES FOR SALE.

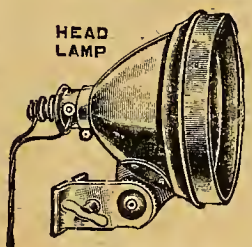
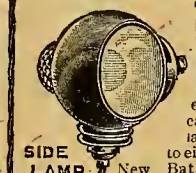
"Volex"



DRY BATTERY Lighting Sets.

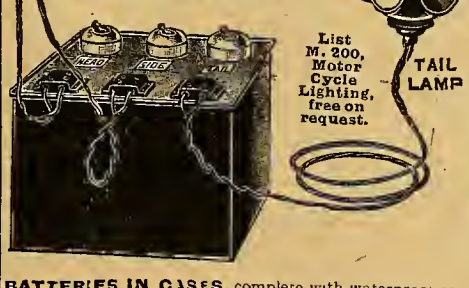
BRITISH MADE.

Volex Lighting Sets are the ideal, no-trouble outfits for the Motor Cycle and Sidecar.
For over ten years they have been in use for this service, and of recent years, in consequence of their dependency, the demand is constantly increasing.
Dynamo Lighting Sets with Accumulators require careful attention and owing to complications have a tendency to go out of order. Accumulators, if not regularly charged, whether in use or not, sulphate and become useless.



"VOLEX" DRY BATTERY LIGHTING SETS give no trouble whatever. The Battery, which is fitted in a metal container with switchboard mounted on top, lies conveniently in the bottom of the sidecar and with ordinary care will last, when in use, from six months to eighteen months without renewal. New Battery can be fitted in a few minutes at but little cost. The Battery Case contains three separate Volex 4-volt Aero Dry Cells, with separate connecting boxes for the cables to Head, Side, and Rear Lamps. If one of the batteries becomes exhausted it can be replaced independently of the others. Unless specified, we always provide 4 volt Metal Filament Bulbs to each lamp, but 8 volt Bulb for Head Lamp will be provided where desired. **Complete outfit (as illustration), including Head Lamp, Ball Pattern Side and Tail Lamps, 3 Volex Aero Dry Batteries in metal container with switchboard, Metal Filament Bulbs, and Waterproof Conducting Cords. - - Price £6/10.**
Spare "Volex" Aero Batteries 15/- each.

CAUTION.—We would warn users that they may be offered substitutes for the "Volex" Dry Battery. No other battery will approach in reliability, durability, or capacity the British Made "Volex."



List M. 200, Motor Cycle Lighting, free on request.

BATTERIES IN CASES, complete with waterproof conducting cords, to work in conjunction with own lamps.

Description.	Price.

BOOT

REPAIRING

"Elite Holdtite Rivetless Soles."

Soles STUCK ON.—

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdtite Sol-fix solution. **We guarantee them to hold as firm as rivets or sewing.** This process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof.** Full instructions given with each pair of soles.

When sending repairs :-

1. It is advisable to send complete wheel.
2. It is essential that outside fittings such as axle nuts, gear or clutch operative parts, washers, etc., are NOT sent.
3. A letter advising us date despatch, station sent from, and mark and number of hub should be posted, and, MOST IMPORTANT, two labels bearing sender's name and address on reverse of both should be tied to the wheel.

We are justly conscious that we have done our part well.

RECOMMENDED BY THE STURMEY-ARCHER Co

We regret, however, through **heavy pressure on our works at the present time, we cannot undertake repairs at short notice, but you can rest assured that orders will be executed as promptly as possible, while we are now in a position to undertake the immediate repair of Sturmey - Archer 'J.S.' Hubs.**

COUNTY ENGINEERING CO.

3½h.p. N.S.U., kick starter, 2-speed, front and rear sprung, good tyres; £42/10.—54, Dundonald Rd., Wimbledon. [2860

N.S.U. Twin, 2-speed, free, Bosch, B. and B., good running order; £30, or near offer.—P.O., Kingston, nr. Canterbury. [3371

5-6h.p. N.S.U. Combination, Bosch, Senspray; £40, or near offer, bargain.—Trengove, 23, Church St., Great Harwood. [X1395

6h.p. N.S.U. Motor Cycle and Sidecar, speedometer, 2 speeds, tyres splendid; £55.—Morley, 49, Narford Rd., Clapton, N.E. [3494

6h.p. N.S.U. (1914 engine, m.o.i.v.), in splendid condition, single geared T.T., good tyres, etc., less mag.; £30, or nearest offer.—29, Brudenell Rd., Leeds. [X1332

N.S.U. 6½h.p. Twin, Bosch, 2-speed, free, engine in good order, paint as new, Indian red; snap at £38.—Redshaw, Hollsannery Cottage, Bidfeord, North Devon. [2968

N.S.U. 5-6h.p. Twin, B. and B., Bosch, good tyres, 2-speed gear, lamps, horn, all in excellent condition; £35; ride away; after 6.—6, Coverton Rd., Tooting. [2807

N.S.U., 3½h.p., 2-speed gear, free, mag., B. and B. carburetter, new heavy back Dunlop, head lamp, generator, requires slight repair; bargain, £20.—Box L3,820, c/o *The Motor Cycle.* [2972

N.S.U. Combination, 6h.p. twin, 2 speeds and free, overhead inlets, kick start, Bosch, spring frams (fore and aft), tyres as new, tools, and spares, speedometer, 3 lamps, perfect order throughout; £55.—51, Gilpin Av., East Sheen, S.W.14. [3132

N.U.T.

N.U.T., 1915, T.T., 2¾h.p., overhead valve J.A.P. twin, 2-speed; £65, no offers.—Luton Tool Co., Crawley Rd., Luton. [3544

T.T. Twin N.U.T., single speed, new condition, new head lamp set, very fast, in perfect running order; £75; wanted, combination; private owner.—Seen 130, High St., Harlesden. [3099

N.U.T.—Sole agents for Staffordshire. For particulars of prices and deliveries, watch future announcements.—The Walsall Garage, Wolverhampton St., Walsall. Tel.: 444. [5605

N.U.T.-J.A.P. 4-5h.p. Twin C.B. Combination, N.S.U. gear and 3-speed hub, splendid condition, just overhauled, speedometer, spare tubes and cover, 3 lamps etc.; £80.—317, King St., Hammersmith. [3200

N.U.T.—We have been appointed district London agents for N.U.T. motor cycles. We hope shortly to be in a position to give full particulars of the new models and approximate dates of delivery.—Vivian Hardie and Lane, Ltd., 24, Woodstock St. (off Oxford St.), Bond St., London, W.1. 'Phone: Mayfair 6559. [0024

O.K.

O.K. 2½h.p., 2-stroke, splendid condition; £35.—66 Durban Rd., Grimsby. [X1085

2½h.p. 2-speed 2-stroke O.K. Junior, good going order; £40.—Mid. Parker, H.M.S. "Resolution," G.P.O. [X1083

JONES' Garage, special agents for O.K. machines Broadway, Muswell Hill, N.10, and Woodside Parade, North Finchley. [2923

O.K. Juniors must be booked now if you really want to get there and back every time.—Young's, The Parade, Kilburn, N.W.6. [0963

O.K. 2¾h.p., 1917, smart appearance; genuine bargain going; going cheap; £32.—Ashford, 49, Dagmar Av., Wembley Hill, Middlesex. [2923

O.K. Lightweight, 2-speed, countershaft, late model, fine order, complete lamps, tools, etc., £38.—Woolley, Harbour St., Whitstable. [3300

O.K. Junior, 1916, countershaft 2-speed, complete with lamps, horn, pump, etc., new Dunlops, aluminium footboards, machine been stored, and in practically new condition and perfect; first £40.—6, St. Albans Av., Acton Green, W.3. [3735

Importation of Motor Cycles into the British Isles.

AMERICA can now export into this country as many motor cycles as she cares to send, and, as it is not likely that incoming machines will be sold at a less price than that ruling in the country of their production, no question of dumping, with its consequential penalties, need be considered. It is certain too that there will be no big flood of machines—at present the very high cost of manufacture in America, together with the existing 33⅓% duty, would preclude any possibility of such a thing happening. Both buyers and British manufacturers have awaited this news with mixed feelings. Many makers have full order books, and have not viewed with the slightest apprehension this expected announcement. There are a few, however, who are uneasy, and scent a storm in the distance. Even now they are "tightening their grip," so to speak, knowing a fight is imminent sooner or later. These men saw that British manufacturers were coming to grips in 1914. Indications were very obvious then that American productions were appealing more and more to the British buyer. Neither was it salesmanship nor good service alone that sold these machines.

A few long-sighted men maintain that it is a fool's paradise in which makers are living to-day. Certain it is that never again will such a quantity of orders be obtained with such little effort; and to find difference of opinion or no opinion at all on such a vital subject as the importation of foreign motor cycles is ominous.

We know the British maker turns out the finest machines in the world, and that for the moment demand is much in excess of production; yet new models showing big improvements on 1914 designs are comparatively rare.

The present demand should not blind manufacturers to the fact that old designs will not do. At the moment, buyers will take almost anything, putting up with poor finish and bad detail work, knowing that general labour trouble is chiefly responsible.

The removal of import restrictions on motor cycles, so far as the quantity imported is considered, should be a stimulant, and not be treated with the indifference, which, after all, may be simply a pose on the part of many manufacturers we have met. The real tussle will come if, and when, the import duty is removed.

The A.C.U. Six Days Trials.

IN four days' time we shall see a renewal of the Six Days Trials, after an interval of five years. It will be the first great trade trial of motor cycles since the war, greatly surpassing the short distance events in importance and its far-reaching effects. In previous years, it was the one great event in which almost all manufacturers essayed to test publicly their new models, knowing full well that any motor cycle that came through the Trials with flying colours merited the praise received; conscious, too, that brilliant achievement would beget financial success.

As a test for sidecar outfits it is supreme. The Welsh byroads, with their water gulleys, water-splashes, and steep gradients, will eliminate any sidecars, of which the chassis are unsound. It is a sporting test, too, and this year everyone is anticipating it with more than usual eagerness. We reviewed the chief features of the trial on this page last week; there is nothing strikingly original in the programme; indeed, originality in trials in these days must of necessity border on the futile, for the most worthy innovations have already been tried. We have urged many times that still greater attention should be paid to the silencing of motor cycles, and this year marks will be deducted for excessive noise. To make the trials a great success and enjoyable, we must hope for fine weather; pouring rain will add to the difficulties of the rider, but, on the other hand, will provide an additional test for transmissions and electrical equipment.

An index to the advertisements in this issue will be found on the page facing the back cover.

OUR AMERICAN NEWS LETTER.

Sport and Business Phases of the Motor Cycle as they are Happening in the United States. A New Indian "Scout" Model.

WITH the late and highly successful war hull down on the horizon the pastime of motor cycling has again come into its own, and on a bigger, better, and busier level than ever. Possibly the most illuminating indication of this far greater popularity is the fact that, whereas only two large factories were keen for the racing game at the beginning of the season, the Harley-Davidson and Indian, who played a lone hand for several months and shared all honours between them, now as the season goes into the tail end, but with plenty of big races ahead, the Excelsior factory has had a hypodermic injection of pep, and they are hot after the first honours at the biggest race of the year—Marion-Indiana 200 mile road race—with eight motors that burn the wind. The Reading-Standard, too, have felt the urge, and as their stock motor rates well oversized, they are making a 61 cubic inch (1,000 c.c.) job to get back in the fold and line up with the rest of the field when the starter's flag drops. With four makes hot after the glory we may look forward to a busy season.

Records Across the States.

On the road we have had a revival of interest in the record-making and breaking rides. Over on the Pacific Coast four machines have looped it down the highway from Canada to Mexico, a matter of riding 1,714 miles and crossing five mountain ranges with plenty of smooth boulevards on the fag end of the trip to pull the m.p.h. up, and at the present time three records are on the book. H. C. Scherer, on a Sports Model Harley-Davidson, holds a medium-weight mark of 64h. 58m. This is for 36 cubic inch (590 c.c.) motors. E. G. Baker, driving an Indian and sidecar machine, rolls the distance in 65h. 53m. His motor capacity was 72.6 cubic inches (1,190 c.c.). Wells Bennett, astraddle of an Excelsior, is the solo record holder with a time of 53h. 28m. Incidentally, Baker had shot down the trail solo in 58h. 47m., but held the record less than two weeks.

Baker, who is also known as the "Cannonball," has made two attempts at the Trans-continental record made by the late Alan T. Bedell, on a Henderson. The Bedell-Henderson record of 7 days 16 hours 16 minutes was hung up in June, 1917. Baker has made three unsuccessful rides to lift this honour, but was jinxed each time, twice within 500 miles of his goal. He has left the Pacific Coast once again, and before this appears in print may have startled the motor cycling world with a coast-to-coast ride in a fraction over five days. At least, those are his plans. And rumour has it that Baker will attempt a Trans-continental sidecar record before snow flies. That would be making motor cycle history.

Sporting Competitions.

Hill-climbing has caught the fancy of the riders, and it is the most popular outdoor sport motor cyclists enjoy this season. The idea is to look for the most formidable slant possible that combines with it a treacherous surfaced grade, then to advertise the climb as impossible, after which it is, according to Hoyle, to make your programme and rules ready. But with this defect, a loophole in the rules that permits of wrangling over what is stock and non-stock. Believe me, that latter is the nemesis that has pursued all local hill-climbs around our section, and being referee is no sinecure. The Motor Cycle and Allied Trades' Association Competition Rules are just a bit too lax in defining stock, and the right of a promoter to bar or admit motors as he may see fit makes for more than the usual bit of chin music and word barrage. We are heartily in favour of 61 cubic (1,000 c.c.) inch and 74 cubic inch (1214 c.c.) open classes only in competition until a fair definition of the word stock motor is placed on the books.

The National Road Championship Race at Marion, Indiana, to be staged on September 1st, bids fair to rival Dodge City's famous 300 mile event of a few seasons back, and it is likely that teams of at least five fast men and motors from each factory will be in action on the road, and thousands of motor cycle enthusiasts will be on deck from all points of the compass.

The new Indian Scout model fitted with an engine of 574 c.c., rigid duplex frame, 26in. wheels. Its weight is 260 lb., gear wheels being used for the primary drive, the final chain drive being on the right of the machine and unenclosed.

New Models.

So much for the sporting phase of the pastime. Rumours are being whispered about that 1920 will see new models on the market. Here are a few caught at random. The Excelsior are ready with an L head four-cylinder motor and shaft-driven wheel. Then the next (whisper!) that the four-cylinder is fair dinkum, but the chain drive has not been abandoned.

The Harley-Davidson are reported to be marking time in basic design, but are refining their minor details a bit. Then in the next breath is the news they are ready to go over to separate lighting system—*à la* generator and battery.

The Cleveland, our best two-stroke motor cycle, is still sticking to the original power plant, but is going in for a stronger frame with less nick-knack on it.

The Indian Scout Model.

The Indian have in hand a medium weight, a miniature Powerplus motor of 35 cubic inches (574 c.c.), with a train of gears taking the place of short drive chain and a new three-speed gear. The whole power plant removable as a unit. It will be a 26in. wheel job, and a rigid frame of the duplex type, not unlike the rear end of a Henderson in general outline. The forks are husky young edition of the big twin model, and mudguards are supported by strap instead of rods. The kick-starter will be on the right which is opposite to American practice but almost universal with your machines I imagine. The chain drive is on the right side, and is not enclosed. It is a wonderful bit of work, the product of C. B. Franklin that well-known Irish road rider who gave a good account of himself on track and road competitions several seasons ago. The new motor will be known as the Scout model, and it is an advance in motor cycle construction that will make an instant appeal to riders, especially of the Clan Short-legged. The Scout Indian weighs 260 lb. and will hop over the road at the rate of 63 all out. In fact, testers have rolled the little one from Springfield to Boston, a matter of 100 miles, in 121 minutes. I had it out in deep sand and could ramble around in second gear and batter down 4in. ruts in spite of my 195 lb. of bone and bone.

The big Indian is being gone over by Mr. Franklin and no longer will there be adjustable handle-bars and all the Swedish *bric-à-brac* cluttering the clean lines of the head and fork fastening as in the past. I saw a reverse gear working satisfactorily on the sidecar outfit.

I also hear that 27×3½in. tyres are being made for the market, and that 26in. wheels will be optional on some makes next year. Twenty-six inch wheels are stronger, give more mudguard clearance, and lower the saddle position. I am strongly in favour of them.

E. B. HOLTON.

A Cooling Test.

A SELANGOR correspondent appeals to British makers to lower the Scott time of 7½ hours for 100 ascents of Sutton Bank, suggesting that an engine which can keep cool throughout this test would be most suitable for the tropics. It would be a pity if any readers regarded the technical side of this suggestion seriously. The achievement was probably beyond the compass of many machines at the time when it was performed; but it constitutes no better test of cooling than a single ascent, for the simple reason that the engine has ample time to re-cool during the one-mile descent. In other words, the feat was a splendid demonstration of reliability and of brake power; but as a test of cooling it is not remarkable, and affords little criterion for tropical riders, who have to negotiate longer and steeper hills in higher temperatures. No modern machine, with the possible exception of some fifth-rate two-strokes, should overheat during the ascent of Sutton Bank.

Nearly up to £200.

I HAVE yet to see a motor cycle listed at £200 or over, but our recent issues have advertised machines at over £190. It remains to be seen whether some dozen cycle cars and light cars catalogued at a lower figure will share the universal rise in prices when they emerge from the teething stage into production. If not, we shall at last see the several types matched against each other without price handicaps. I have few doubts as to the issue of such a competition, but I am bound to say that the general running of some of the best 1919 sidecar outfits is a real eye-opener. They climb like cats, hold the road like postage stamps, start with consummate ease, and purr very prettily in neutral. Still, if designers eliminate every other imaginable weakness, they cannot offer the driver such comfort and protection as proper coachwork affords; exposure and the single driving wheel represent rather a high price to pay for the narrow turning circle, which would be the sole technical advantage of the sidecar if it ever loses its old price vantage.

Carrying Spare Tubes.

MY garage has a special corner consecrated to scrap accessories, and this dump contains a variety of cases intended for the carriage of spare tubes: some of these cases cost quite handsome sums. There are four ways of carrying a spare tube, only one of which is really good. They are as follows: Round your body (not at all bad, but unsightly); rolled up in a special cheese-shaped box (so awkward to pack the tube that riders always wear the damaged tube round their waists after a roadside change); furled round the handle-bars (at the mercy of thieves); and *my* way! Some years ago I bought a soft leather tube case, about 10in. long by 3in. wide, into which the tube is folded after all the air has been squeezed out. I think the vendors were the St. Edmund Motor Co., Northampton, if memory has not played me a trick; anyhow, I saw the case in a shop window when on tour and thought it looked good. When the tube has been packed, the case is fastened to the saddle pillar tube, and there is no possibility of damage. If a rider prefers to lap the tube round his handle-bar, he should secure it with a couple of rubber loops cut from an old tube, which will hold it firmly without chafing it. Similar fastenings are good for any tin boxes carried in the pannier bags, *e.g.*, tyre kits.

Standardised Controls.

I RECOUNTED the other day how, after two years on a clockwise throttle lever, I obtained a new mount with an anti-clockwise throttle and crashed on a vertical bank in consequence. This week I have to report a variant of the same nuisance. I was riding another strange machine, on which the positions of the brake and clutch pedals were the reverse of what I am accustomed to. Naturally enough, in the first emergency, I stood on the clutch pedal instead of braking hard, and escaped catastrophe by the width of a whisker. Somewhere in the back ground there is a trade society whose main activity of late has consisted in proclaiming trials. I suggest it would be quite as usefully employed in arranging for

(1.) All throttle levers to open in the same direction.

(2.) All brake pedals to be on the same side of the machine.

Starting with a Broken Valve-lifter.

FOR some inexplicable reason coincidences seem peculiarly common in motor cycling experience: at any rate, if I hear a yarn, or get my attention caught by a printed reference, a similar incident befalls me soon afterwards. The other day I saw a quotation of sundry ancient tips for starting an engine when its valve-lifter was broken, together with the addition of others which the critics considered more modern and efficient. I wondered idly which of the selection was the best, and the very next time out the eye in the steel lever of my own engine cracked across, and released the Bowden wire nipple. By the crankiness of fate, I was trying to run to earth an old friend who had changed his address several times during the war, and stoppages were very frequent. I tried every imaginable dodge. If the engine was really warm, I could just get her over compression on the kick-starter, though it was very tight, and of the hot-stuff kidney all round. When it was cool, no response to the starter was obtainable, and by far the simplest and least fatiguing method was to use the compression cock as a decompressor. Pushing off with the clutch out, and gradually releasing the handle-bar control was na poo, except down a steep gradient; I only secured one start by this method. Meditating upon what I could have done

Occasional Comments.—

if no compression tap had been fitted, I made various experiments, and was forced to conclude that some improvised method of valve-lifting was the only solution. Luckily, on the machine in question, it was not difficult to jam the crank case lever with a tool or bit of wood, and pluck it out when the run and push had got up speed. To-day I took it out still unrepaired, and learnt how invaluable rubbers on the boot soles are with the jump mount, as compared to plain leather soles; they give you a first-rate road grip. [Note for hill-climbing competitions.]

Combustion Chamber Design.

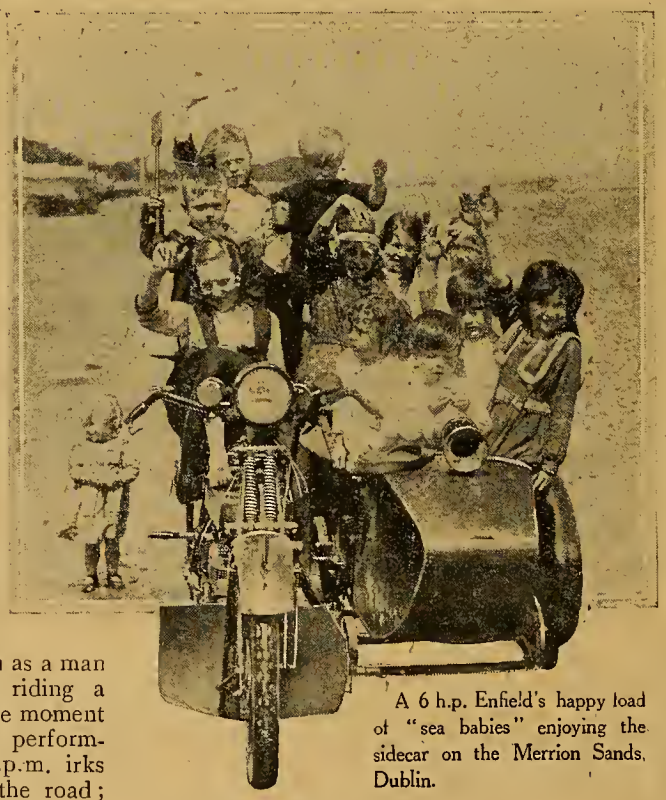
I QUOTE the following from a criticism of a certain combustion chamber, written by Mr. Ricardo: "Owing to the fact that unnecessarily large valves were employed, and that the distance from the valve centres to the cylinder centre was not reduced to the minimum, the combustion chamber was extraordinarily shallow, its depth tapering from about ½in. immediately over the valves to about ¼in., or even less, at the point most remote from the valves, while the sparking plug was placed almost directly over the inlet valve. Such a form of combustion chamber not only involves very serious heat loss to the walls, but is also the worst possible both from the point of view of maintaining turbulence, and, therefore, rapid burning, and also as regards its tendency to set up detonation." Mr. Ricardo designed and fitted a new head to the engine in question, and got an increase of 16% in the horse-power and about 18% in the fuel economy, although the new head entailed a higher compression ratio. The engine in question was an American light car engine, but the description fits not a few motor cycle combustion chambers pretty closely, and consequently suggests reasons why certain post-war engines show such manifest advances. The above quotation may interest some of our cycle car readers, who will remember the speed and fuel economy of the Baby Mathis engine, which had valve heads about the size of shillings.

Maintenance of Tune.

IT is becoming increasingly evident that the coping stone of quality in a flat twin is *maintenance of tune*. In the summer months few motor cyclists have much leisure for tinkering; and in proportion as a man is fastidious, he dislikes riding a machine which cannot at the moment produce its normal road performances. The loss of 500 r.p.m. irks him when he is alone on the road; and it irks him far more when another rider tries conclusions with him, especially if the challenger is straddling a duplicate machine in superior tune. It is a characteristic of all multi-cylinder motor cycle engines that they lose their finest veneer of tune faster than single-cylinders, and this applies to the V's as much as to the flat twins. But, on the whole, the flat twins are the worse offenders; they lose their tune, on an average, rather faster than the V's, and, as a rule, they are less accessible when retuning is taken in hand. Consequently, no manufacturer of flat twins can desire a better tribute than the following imaginary testimonial would represent: "I bought one of your machines last March, and, though I have covered 2,000 miles and done nothing whatever to the engine, it is running at least as well as when I bought it."

The Obverse of the Medal.

LET the trade understand that flat twins are booming in spite of the too prevalent shortcoming mentioned in the last paragraph. Flat twins are deliciously easy to start as compared with the ordinary single. They are free from the V's irritating fondness for starting on one cylinder, the other cylinder chipping in later on, when so disposed. They run slowly when declutched. They have a lovely balance. They rev. like a cream separator. All these merits are very attractive to riders who have suffered many things from the contrasted faults. But in the long run the public love the machine which will continue to run well with the minimum of tinkering; and on this point quite a number of flat twins are still below par. Accurate lubrication and durable valve gear are probably the main requisites, for I should hate to think that in these days any firm can be guilty of a rear cylinder which overheats.



A 6 h.p. Enfield's happy load of "sea babies" enjoying the sidecar on the Merrion Sands, Dublin.

Scooter Weight.

DO the A.C.U. really think that the average scooter weighs inside 60 lb.? I have tried two or three machines, and I seriously question whether the limit is not too low, even as things stand, while some of the machines I know are likely to be stiffened up and weigh even more in the near future. It is obviously desirable to keep these machines as light as possible; but for the time being I should have thought that manufacturers might have been given a more generous weight allowance. Nor must it be forgotten that the present designs do not necessarily represent finality.

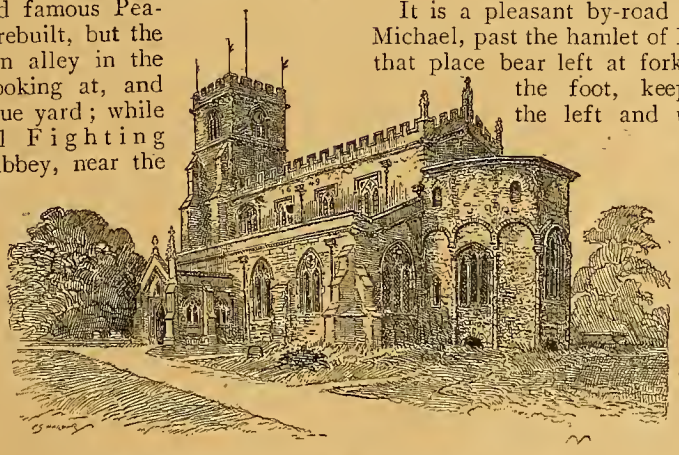
DAY RUNS AND WEEK-ENDS.

IV.
Hertford to St. Albans, Woburn, Ampthill, and Hitchin.

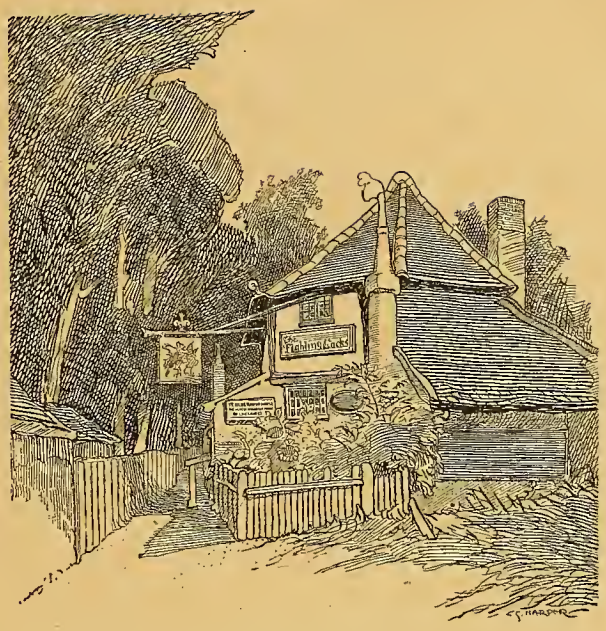
By CHARLES G. HARPER.

Previous instalments appeared in "The Motor Cycle" August 7th, 14th, and 28th.

THE twelve and a quarter miles from Hertford to St. Albans, by which we begin this circular tour of seventy-five miles, is a surprisingly pretty and little-used road for what we usually style the crowded Home Counties. Proceeding westward from Hertford, we are soon across that oddly-named stream among the several oddly-named rivers of Hertfordshire, the River Mimram, and into the pleasant village of Hertingfordbury: long name, small village—so small that there are possibly more letters to its name than houses in the place. Passing Cole Green, we come into Hatfield, and leave the town chiefly on the left, crossing the Great North Road. In a further four and a half miles we approach St. Albans, entering by way of the impressively broad main street in the suburb of St. Peter's. St. Albans, like Hatfield, is almost too familiar to need any remarks, but to some it may be not completely known. The great abbey, built with Roman bricks from the vanished city of Verulamium, is, of course, the chief feature. It stands on the site of the martyrdom of St. Alban, the proto-martyr of England. It is the second longest ecclesiastical building, 550ft. in length (Winchester Cathedral exceeding it by only some 5ft.), and it stands on a higher site than any other: only this elevated position can scarce be noticed, except from the village of St. Stephens, to the south, where it is indeed very striking. St. Albans is a wonderfully interesting and picturesque old place, and in nothing more so than its old inns. The old and famous Peahen has, unhappily, been rebuilt, but the quaint Fleur de Lis in an alley in the Market Place is worth looking at, and the George has a picturesque yard; while the pretty little octagonal Fighting Cocks, down below the Abbey, near the River Ver, is as old-world as one could wish to see. Not quite so old-world as the legend on it would seem to imply: "Rebuilt after the Flood." This, however, was a strictly local flood, and not the Deluge from which Noah and his family escaped in the Ark.



Wing Church, an example of Early Saxon architecture.



The Fighting Cocks Inn, St. Albans, one of the oldest inhabited houses in England.

For the rest, a walk on the street called Holywell Hill, or along that other known as "Romeland," will disclose to the knowing observer many old houses, not now inns, whose capacious archways and yards proclaim that once they were such.

Our way to Berkhampstead out of St. Albans lies through the charming old village of St. Michael's, at the gates of Gorhambury Park. In the old church, in its alcove in the north chancel wall, is the rather startling effigy of Francis Bacon, Baron Verulam and Viscount St. Albans, who died in 1626. Some people think he was the author of the Shakespeare plays. The heated controversies on this subject render the statue of more than common interest, but it is remarkable in itself, representing the philosopher seated, in his habit as he lived, and in a characteristic attitude, alluded to in the Latin phrase, *Sic sedebat:* "Thus he sat."

An Architectural Curiosity.

It is a pleasant by-road which leads up out of St. Michael, past the hamlet of Leverstock Green. Beyond that place bear left at fork, steeply descending. At the foot, keep right, then second to the left and under the railway, thus emerging at Boxmoor, upon the main road to Berkhampstead, three and threequarter miles distant. In the church is a curious feature: one wooden column among its stone brethren, and fashioned exactly like them, suggesting that the old builders had either miscalculated their requirements or else had exhausted the quarries

Day Runs and Week-ends.—

whence came the stone for the others. It is a problem not now to be solved. The east window is filled with stained glass to the memory of Dr. John Cowper, rector, and father of the poet Cowper, whose two tame hares, "Puss" and "Tiney," are stated by guide books to be figured in the window. They are, but so small and so obscured by the altar reredos that only a specialist could discover them.

Beyond Berkhampstead is Northchurch, with a curious brass in the church to "Peter the Wild Boy," found in the Forest of Hertswold in Hanover in 1725, who died here in 1785, still known at the date of his death as the "boy," although nearly seventy years of age. We now make for Tring, but turn off to the right, on approaching the town, for New Mill, reached in about one mile. Here the road crosses one of the two great reservoirs, and comes to the uninteresting but well-named Long Marston, about a mile in length. In midst of this long-drawn rustic place, turn right as for Cheddington railway station, but turning left before reaching it into a very fine—nay, noble—road commanding wonderful views of a stately mansion on a height. It looks lordly, and the road itself, crossed by a railway level crossing, is planted on either side with ornamental trees in clumps. It speaks of wealth and great expenditure, as well it may, for this is the domain of Mentmore Towers, which came to Lord Rosebery by his marriage with the daughter of Baron Meyer de Rothschild.

The Market Place, Woburn.

A Change of Name.

Bearing to the left past the Stag's Head Inn, and passing the church, the road steeply descends, and then winds away over level lands and commons with two gates, each one usually with the customary loafer awaiting the casual copper. Then we come into Wing, styled in charters of A.D. 957 "Weowungum." Fortunately that impossible name has long been discarded. The church is Early Saxon, and very remarkable, with a kind of crypt under the chancel. Note the odd brass to "honest old Thomas Cotes," 1648, porter at Ascott Hall, who, the inscription goes on to inform us, "hath now, alas! left his key, lodge, fyre, friends, and all, to have a room in Heaven."

The ruins of Houghton Mansion, near Ampthill.

To Leighton Buzzard is three miles: Leighton "Beaudesert" is its true name. In the market place there still remains the ornate fourteenth century cross. Here, at the fork of three roads, we take the left for the two conjoined villages, always referred to together, as though they were a firm, Heath and Reach. They live on sand, very fine and remarkable: red, white, and yellow sands, extensively dug. Beyond them, at Sheep Lane, the Holyhead Road is crossed, and we come into the decayed townlet of Woburn, adjoining Woburn Abbey, seat of the Duke of Bedford: decayed because the Duke will not allow building near the sanctities of Woburn Park.

And so we proceed six miles to Ampthill, by Husborne Crawley and Ridgmont. Ampthill is a little town not very much visited. In the church is a monument to the man who named New York: Richard Nicholls, born 1624, killed at the naval battle of Solebay, 28th May, 1672. He it was who captured the Dutch American colony of New Amsterdam in 1664, altering the name to "New York" in honour of his patron, the Duke of York, afterwards James II. The cannon-ball which killed him is exhibited on the monument.

A Deserted Mansion.

Outside Ampthill are the ruins of Houghton, a mansion built about 1610. From one of its windows in 1767 the young Marquis of Tavistock was seen by his wife to be thrown from his horse and killed. The house was never afterwards inhabited, and there it stands, on its terraced hill-top, a melancholy evidence of departed grandeur, with the once enclosed park long since dismantled, and open to all comers.

Due east from Ampthill the road runs to Shefford, past Maulden and Claphill. In Maulden churchyard note the mausoleum, built by an Earl of Elgin in 1656, containing a weird effigy in white marble of his second wife, Diana. A glimpse of it can be got through the barred window.

At Shefford turn to the right, along the main road to Hitchin, passing Henlow level crossing. Hitchin is one of the most charming old towns in the Home Counties, with many quaint houses and several stately mansions. The old coaching inn, the Sun, has a large and very beautiful garden at the back. Straight through the town, and uphill, taking fork to left, and leaving the main road—a branch of the Great North Road—Ippollitt's Church is on right. The oddly-named village takes its title from St. Hippolytus, the colt tamer, to whom the church is dedicated; but the letter "H" has been dropped. Soon we come to Little Wymondley and Stevenage, a long village with very broad street, at the further end of which are the "Six Hills." At next fork, bear left for Hertford, *via* Watton, Waterford, and the park of Goldings.

A Three-wheeler on Car Lines.

The 10 h.p. Merrall-Brown, fitted with Channel Steel Frame, Water-cooled Engine, Detachable Wheels, and Reverse Gear.

POSSIBLY the existing condition of prices accounts for the renewal of interest in the three-wheel runabout. The simplicity of the type, however, is more apparent than real, and in the case of the 10 h.p. Merrall-Brown the designer has not succumbed to the temptation of producing a cheap or scamped specification.

Since we described this machine in our issue for May 8th (page 472) the design has been refined at certain points, and the model now illustrated presents a very pleasing appearance, having a somewhat high honeycomb radiator and aluminium bonnet.

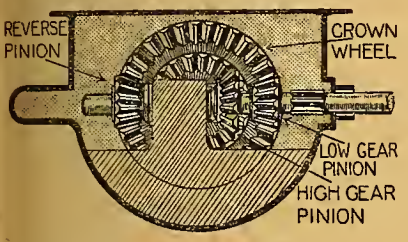


Diagram illustrating the action of the two-speed gear

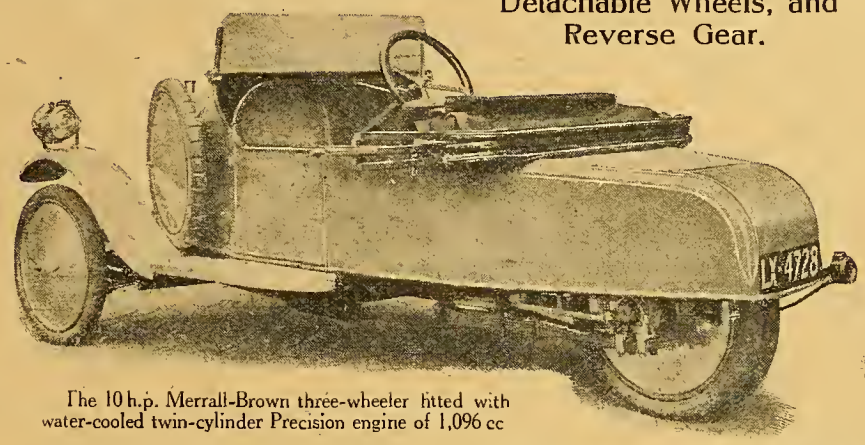
A Precision V twin engine of 1,096 c.c. capacity (10 h.p.) has been selected, and water-cooling is employed on the thermo-syphon system. A Thomson-Bennett magneto is fitted.

Two speeds forward and reverse are fitted, the transmission from engine to gear box being through a single-plate Ferodo clutch and propeller-shaft. From the gear box to the back wheel the drive is by an unenclosed roller chain.

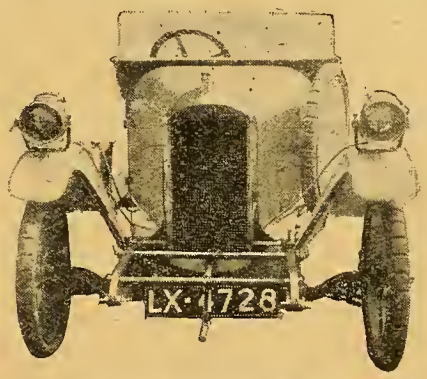


The 10 h.p. Merrall-Brown three-wheeler fitted with water-cooled twin-cylinder Precision engine of 1,096 cc

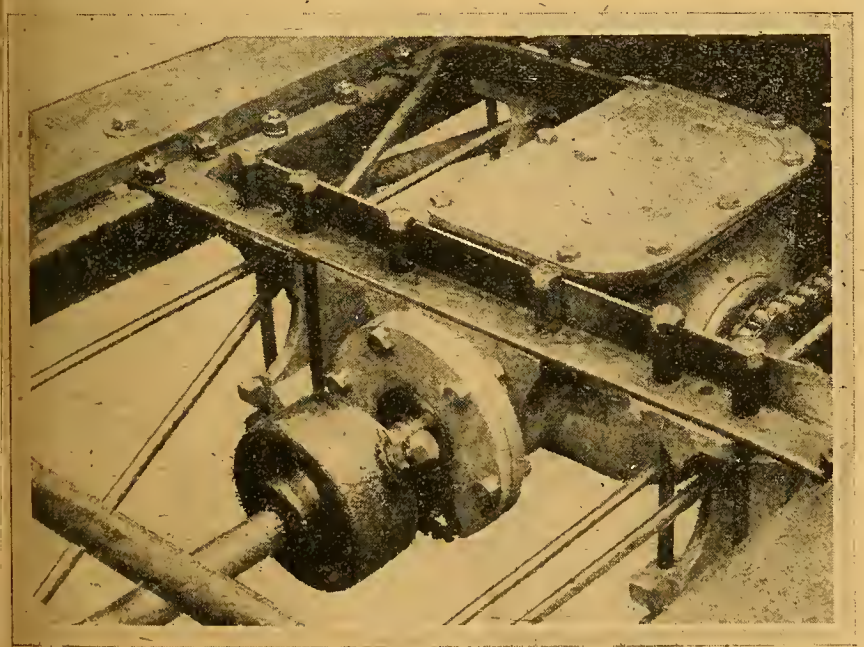
A channel steel frame with dumb-irons at the fore end is adopted, the cross members being tubular. The front axle is of I section, with steering heads following conventional car practice; in fact, the runabout closely resembles an orthodox light car when viewed from the front. The guards, semi-elliptic front springing, bonnet, and scuttle dash are all points accentuating this impression. The steering system, however, is by bobbin and double steel cables, which, perhaps, is somewhat surprising, in view of the abandonment of cable steering by its earlier advocates. In a £250 proposition the potential buyer may expect rack and pinion or irreversible steering equipment.

Chain tension is adjusted by the radius rods controlling the movements of the back wheel, which is carried by large quarter-elliptic springs, these being clamped underneath the cross members, which support the gear box at the rear of the frame.

The wheels are of the standard Dunlop detachable variety with discs fitted, and the rear wheel is composed of two of these, side by side.



Front view of the M.B. runabout. Note the unconventional position for carrying the spare wheel



Showing the propeller-shaft, two-speed and reverse gear box, and part of the roller chain that conveys the drive to the twin rear wheel

On each side of the back wheel are the hand and foot brake drums, but the detachability of the wheel in no way interferes with the adjustments of these.

The two-seater body is of quite a pleasing design, a streamline effect being obtained with approximately upright sides. In addition to the bonnet, the wings and wheel discs, too, are of polished aluminium. A door is fitted on each side, and the upholstering is of a character which should provide comfort for the driver and passenger.

The makers, the Premier Engineering Co., St. George's Road, Bolton, Lancs., intend to sell the car at an inclusive price of £250, the specification covering Dunlop 650 × 65 mm. tyres, spare wheel, two-seater body, hood, screen, acetylene head lamps, tail lamp, pump, jack, and tools.

The sale of the Merrall-Brown in London and district will be in the hands of Messrs. Mebes and Mebes, 144, Great Portland Street.

A DOUBLE PURPOSE BRUSH.

A USEFUL accessory, consisting of a metal handle provided at either extremity with a wire brush and a hair brush respectively, has been placed on the market by Messrs. S. Rutter and Co., 16a, Iliffe Yard, Amelia Street,

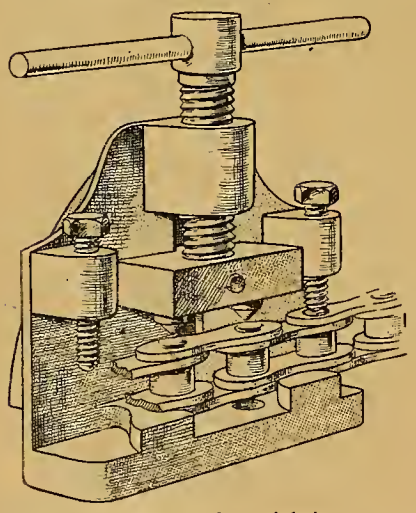
The double purpose brush useful to motor cyclists.

Walworth, London, S.E.17. A wire can be selected from the wire brush for the purpose of cleaning an acetylene lamp burner, whilst the hair brush can be used to remove oil from the sparking plug points.

A USEFUL RIVET EXTRACTOR.

TOOLS which have come into existence through experience on the road are usually of greater practical value than those designed by tool makers to perform some operation with which they have no direct experience. The rivet extractor illustrated is in the former class, and was designed, and made, by Mr. J. James, 53, High Street, Itchen, Southampton, after several unpleasant experiences in extracting rivets to effect chain repairs.

The device patented by Mr. James consists of a main member, the base of which is recessed to take the outside plates of a chain, leaving blocks for the



Rivet extractor of sound design.

inside plates to rest upon. Two set screws engage with rivets on each side of those to be extracted and lock the chain in position while a sliding block, operated by a screw and fitted with a crossbar, carries two pegs which press upon the rivets and so force them out of the chain links. Mr. James has found this tool most useful, and thinks other motor cyclists and garages would benefit by its manufacture as a commercial proposition. He would therefore like to get into communication with a manufacturer who would make it under licence or purchase outright.

SERVICEABLE OVERALLS FOR WINTER USE.

A SUIT of weatherproof motor cycle overalls, sold by Messrs. James Grose, has recently come before our notice. The double-breasted jacket is provided with two large outside pockets, straps for closing the ends of the sleeves round the wrists, and an inner sleeve held tightly to the wrist by an elastic band which prevents the air from passing up the rider's arms, ensures complete protection from the worst conditions of weather.

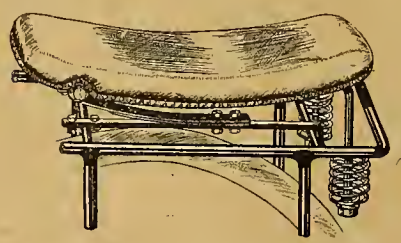
An overall suit of practical design.

The trousers, the tops of which are held well above the waist by means of an adjustable strap, are fastened round the ankles by means of a metal clip and an adjustable strap.

THE TERRY PILLION SEAT.

AN adequately sprung pillion seat, which is suitable for riding both side saddle or astride, is shown in the illustration. The seat, which consists of a metal pan covered with a thick felt pad upholstered in Rexine, is fitted to a strong steel undercarriage, which is made adjustable to suit all makes of carrier, and mounted on two laminated springs in front, whilst two coil springs, of a substantial nature, are employed in the rear. This suspension supplies a cushioning action by which the inequalities of the road are absorbed, and comfortable riding on a carrier in either position should result.

In view of the criticism now being urged against pillion riding, it may be noted that properly constructed seats giving the passenger a sense of security should be conducive to safety.



A pillion seat recently placed on the market by Messrs. Terry and Co.

THE VICTORY TYRE CLAMP.

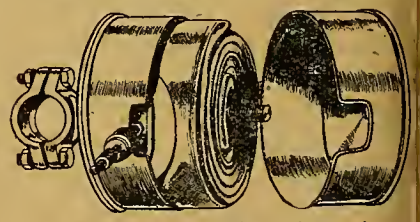
A SIMPLE tyre clamp, which considerably lessens the usual difficulties experienced when tyre trouble necessitates removal and replacing an outer cover, has been marketed by Messrs. Herbert Terry and Sons, Ltd., Redditch. This little device consists of a U-shaped

The Terry tyre lifter, a useful accessory when fitting new tyres.

clamp, the open ends of which are bent so as to fit over the rim of the wheel. One end, however, is provided with an extension in order to hold the cover in position. Having placed the clamp in the position shown in the illustration, the wing nut located on the end of the bolt which passes through the centre of the clamp is tightened to prevent the cover from creeping or slipping off the rim.

A USEFUL ACCESSORY.

MR. P. L. CEARNS, 8, Plaistow Park Road, Plaistow, London, E.13, has lately patented a simple and effective inner tube carrier. Since Mr. Cearns has had lengthy experience riding at the Front, it is only natural that his invention should be a thoroughly practical device. It consists of a round box in which the inner tube is rolled,



A practical device carrying an inner tube.

with slots provided in the top and bottom portion for the valve. Through the centre of the box is a hole, and through the hole runs a threaded spindle attached to a suitable clip for fixing the tube carrier to any convenient part of the machine. The whole is firmly secured by means of a wing nut.

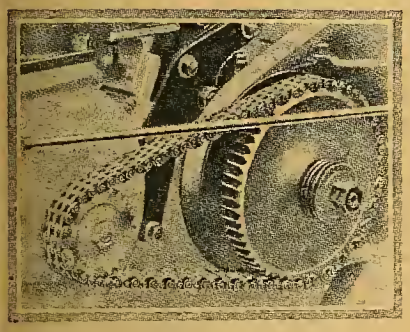
To insert the tube in the case it is only necessary to exclude the air in the usual way, and roll it on the loose metal sleeve through which the spindle passes.

Mr. Cearns finds that tubes never become unserviceable when carried thus

A NEW SILENT CHAIN.

The Hans Renold Segmental Bush Chain.

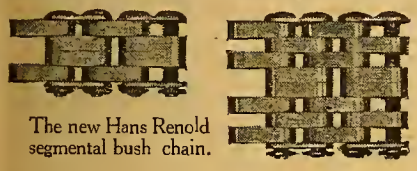
CONSIDERING that fully fifty per cent. of the noises of a motor cycle emanate from the timing gear and transmission primary drive it is perhaps somewhat surprising that so far few have adopted silent chains for one or the other or both.



A silent primary drive chain adapted to a chain-cum-belt driven machine.

One of the most silent single-cylinder motor cycles on the road to-day is the 3½ h.p. Rover, a feature which is contributed to by the fact that silent chains are used both for the transmission to the countershaft and also the magneto drive. On the Matchless, too, a silent chain has been for some time used between the engine and the countershaft; but, taken generally, the silent chain does not appear to have received the attention due to it by virtue of its many advantages.

In the car world silent chains have been and are to-day used quite extensively for camshaft, pump, and magneto drives, and for these purposes Messrs. Hans Renold, of Manchester, have recently introduced a new type of "noiseless" chain having segmental bushes, and as the wearing qualities of inverted tooth chains are greatly improved by their embodiment there is every reason to believe that the new chain widens the scope of the silent chain for motor cycles.



The new Hans Renold segmental bush chain.

Showing the relative size of stud that can be used with the segmental bush.

The advantages of the new Hans Renold chain are only apparent after a careful study of the construction. It will be seen from the first illustration that a complete bush is not fitted to take the load imposed upon the stud. Instead, a segment only is fitted, which permits the use of a larger stud without impairing the strength of the link.

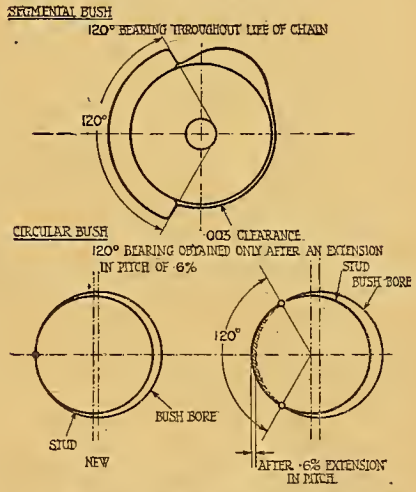
It is fairly obvious that if the hole be bushed only for 120° instead of the whole of its circumference, the stud may be increased by the thickness of the normal bush without reducing the thickness of the metal at the vital point.

A circular stud, since it is fractionally smaller than the bush into which it is inserted, can make only one line contact with the bush. In the new chain, however, the inner diameter of the segmental bush is exactly the same as the stud diameter, and this inner edge stands very slightly "proud" of the hole, so that a bearing surface of 120° is provided for each stud.

With a concentric bush chain having a bush diameter of .178in. and a stud diameter of .175 in., a bearing surface of 120° cannot be obtained until the chain has "stretched" to extend the pitch .003in. per pitch or an elongation of 6%. This figure is almost equal to the wear which will take place during the average working life of a chain used under good conditions.

From the illustrations it will be observed that the holes through which the studs pass are not circular, but each has a considerable recess at its highest point. In addition, there is a clearance all around the stud except for the 120° bearing surface. The indentations in each pair of plates form oil grooves leading to those recesses, and if, as is recommended, an oil feed is arranged to the inside of the chain close to the entering edge of a sprocket, the centrifugal action, which is very considerable on high speed driving chains, is sufficient to ensure thorough lubrication of the studs and bushes.

We understand that the new chain will be used on several first-class cars, including the Sunbeam and Austin.



The increased bearing area obtained by the use of the segmental bush shown diagrammatically.

THE O.K. FLAT TWIN.

Large Output Planned when Production Difficulties Overcome.

AS in the case of every other new design produced this year, Messrs. Humphries and Dawes have experienced considerable delay in connection with raw materials for, and experiments with, their new flat twin. Since we first reviewed this new design in our issue for Feb. 27th last, several alterations of a minor character have been made, but the main elements of the engine remain as described.

Recently we saw this little 347 c.c. engine on the test bench, where, by means of a Heenan and Froude apparatus, 5 h.p. at 2,600 r.p.m. was registered. The designers, however, expect to obtain 7 h.p. In the meantime arrangements are being made for a good output after the show, and experiments are being carried out with various types of frames and forks. One of the latter designs, which, in all probability, will be adopted, embodies laminated C springs. Two and three springs, placed side by side, have been tried with satisfactory results. The type illustrated has two springs, but one we examined had three springs, each with a single leaf excepting at the inner end where a short under-leaf gave support. This type of fork gives both a vertical and a longitudinal movement, and has the virtue that it can readily be adjusted by means of the shafts and locking device on the girder ends of the springs. Another point of interest is that the fork is built up of two sides and not as a complete unit, which is more usual. This method of construction undoubtedly facilitates manufacture, but only a prolonged test can prove whether it is entirely desirable.

The spring fork of the new O.K. flat twin machine.

A GUIDE TO THE SIX DAYS TRIALS.

A Description of the Route with Contours, and the first Competitor's Official Time at each point. Some Observations on Hills and Tests which will be Encountered.

September 15th to 20th, 1919. Total Mileage, 732½.

MONDAY'S MILEAGE	98½	THURSDAY'S MILEAGE	159¾
TUESDAY'S ,, ...	160¼	FRIDAY'S ,, ...	161¾
WEDNESDAY'S ,, ...	152½	SATURDAY.—FINAL EXAMINATION.	

SPECIAL TESTS! Monday and Friday, Consistent Driving; Monday evening, Lamp Test; Tuesday, Brakes; Saturday, Condition.

GREAT interest is naturally centred round the Auto Cycle Union Six Days Trials, which will be held from Llandrindod Wells beginning on Monday next. There are 114 entries in all, among which all the best-known makes will be represented. There are comparatively few completely new makes entered, with the exception of two 3 h.p. A.B.C.'s and a 5-6 h.p. G.L. (a French motor cycle lately referred to in these pages), the rest being well-tried models.

There will be some novelty attached to the trial in that the trial proper will not start until Monday afternoon, the examination of the machines will take place in the morning, and the first day's run starting in the afternoon and finishing after dark will enable lamps to be tested.

A Summary of the Final Regulations.

All competing motor cycles, accompanied by their drivers and passengers, must report to the Chief Marshal at the Drill Hall, Llandrindod Wells, between the hours of 9 and 10 a.m. on Monday, September 15th, 1919. Machines must be presented ready to start, *i.e.*, with petrol and oil tanks filled, number-plates securely fixed, sealing wire attached, and ballast, if necessary, to make up weight.

Engines may not be started at any time during the trial within the storage depots, nor may any replenishment of oil or petrol be made therein. Replenishments of petrol and oil must be made at the official refilling station at the conclusion of each day's run. Smoking within the depots is prohibited. Competitors are requested to take every possible precaution against damaging the floor of the depots either by leakage of oil or otherwise. The starting order has been balloted for, and will be the same each day.

A fast and slow hill-climb, known as the consistent driving test, will take place on Monday and again on Friday, and competitors' times for each of the two ascents will be compared. The hill selected is about two and a quarter miles in length, with an average gradient of 1 in 12. On each occasion the first mile is to be climbed at a speed not exceeding ten miles an hour, and the second mile at a speed of not less than from eleven to eighteen miles per hour, according to the particular class in which the machines are entered. A maximum of forty marks may be lost for the consistent driving test—(1) for exceeding the low speed limit, and—or—failing to reach the high speed, one mark for each mile or part of a mile per hour too slow or too fast. (2.) For failing to repeat on Friday the performance made on Monday—one mark for every second or part of a second in excess of a total of ten seconds' difference between the times for the two slow and two fast climbs.

Here is an example of what may happen: No. 120 in Class C on the Monday climbs the slow portion in 6m. 40s. (9 m.p.h.), and the fast part in 3m. 10s. (19 m.p.h.). On the Friday he climbs the slow portion in 6m. 39s. (9.09 m.p.h.), and the fast in 3m. 8s. (19.2 m.p.h.). All his speeds are within the limits stipulated, and the difference between his two slow climbs is 4s. and between his two fast climbs 2s.; the total difference therefore is 6s., and the result is the loss of no marks. On the other hand, suppose No. 130 in Class B takes on the Monday 6m. 30s. (9.2 m.p.h.) in the slow test, and 3m. 52s. in the fast section (15.5 m.p.h.); on the Friday he takes 6m. 38s. on the slow test (9.05 m.p.h.), and 4m. 14s. in the fast section 14.18 m.p.h.); the difference between his first and second ascents in the slow test is 6s. and 22s. in the fast test, a total of 28s., equivalent to a loss of eighteen marks, and on the Friday he is .95 m.p.h. too slow in the fast test, which costs him an additional mark; that is, a total loss on the test of nineteen marks.

At intervals of twenty miles throughout the route notices are erected stating the number of miles covered from the beginning of the trial, so that a glance at the route card will instantly tell the competitor exactly where he is. This is a most important feature, as much of the country traversed is sparsely populated, and such names as exist are exceedingly difficult to an Englishman.

Route Notices.

Brakes will be tested on Fan Hill (on the second day), and marks will be deducted for any apparent lack of control.

Competitors will be carefully checked throughout the trial, and a competitor is liable to be checked at any point on the route. In actual practice, checks will not be taken at points where a competitor is likely temporarily to have lost time. The attention of competitors is drawn to the schedule rate of speed shown on the profile maps in the programme, the times on the daily route tables being calculated accordingly. There will be no non-stop sections, but certain hills, the position of which will not be published, will be observed each day, and a stop on any such hill will entail the loss of four marks. As the position of these

On the mountain road between Llanwddyn and Bala. This section is part of the third day's run after lunch.

Rudge-Whitworth, Ltd.
(Dept. 600),
COVENTRY.
London Depot:
230, Tottenham Court Rd., W.1.
(Oxford Street end).

The Rudge Multi is in its tenth year.

Its popularity is owing in no small degree to simple control, accessibility, and proved reliability.

"The Times," on May 27th, writes about the Multi Gear:—

"It is almost needless to say that in view of the excellent reputation which this admirable machine enjoys, the variable gear works very well indeed from a practical point of view. This type of gear enables one to "Nurse" an engine, to "rest" it on easy road, and to work it at maximum efficiency on hills. To many riders the hill-climbing abilities of a well-tuned Rudge come as an absolute revelation."

hills will not be published, competitors are warned against stopping anywhere except on the level or on a down gradient.

Special prizes have been offered :

(A.) Team Prize. The Auto Cycle Union offers a gold medal for the best performance by a team of three motor cycles of the same make, such team to be nominated by the manufacturer or his duly accredited representative before the final closing of entries.

(B.) Fuel Prizes. A prize of £5 in each class of more than three entrants (£50 in all) is offered by the National Benzole Association for the best performance by a competitor using N.B.A. benzole throughout the trial. Entrants must give in their names before the start of the trial.

(C.) A cup value 15 guineas is offered by Messrs. Tom Norton, Ltd., Llandrindod Wells, for the best performance by a Welsh competitor. Entrants must give in their names before the start of the trial.

Best Performance.

The number of marks remaining to a team or competitor at the end of the trial shall decide what constitutes a best performance, and if such number shall be equal for two or more teams or competitors, then of those teams or competitors the one making the best performance in the consistent driving test will be judged to be the winner.

The programme this year will be exceedingly complete, and will contain a record of all the Six Days Trials held since 1903. There will be a complete index of the makers who have entered machines, and also of their riders, while the entry list gives not only the names of the entrants, their machines, and riders, but also the gear ratios and engine sizes. Moreover, this year the weights of the competing motor cycles are available to the public. In addition, the fullest possible details have been given concerning the trial, such as maps of the route, contours of the hills, and all the

A Guide to the Six Days Trials.—

necessary particulars. It will be obtainable from the Auto Cycle Union, price 6d.

The following is a list of officials :

STEWARDS.—Mr. A. W. Torkington, the Rev. E. P. Greenhill, and Mr. H. P. E. Harding.

JUDGES.—Lt.-Col. A. E. Davidson, D.S.O., Mr. Hugh H. Gregory, A.M.I.M.E., M.I.A.E., Maj. A. M Low, R.A.F., D.S.C., Lt.-Col. D. F. Nicholl, D.S.O.

CHIEF MARSHAL AND STARTERS.—At storage depot, Mr. S. W. Philpott; luncheon control, Mr. Alec Ross and Lt.-Commander G. H. Pierce, R.N.R.

CHIEF OBSERVER.—Maj. G. Dixon-Spain, O.B.E., M.C.

OFFICIAL OBSERVERS (blue armlet on left arm).—Messrs. F. W. Chapman, F. J. Ellis, W. G. Gabriel, T. A. Jones, C. Kitcat, Grenville G. O. Manton, Frank H. May, H. W. Pierce, H. Tomlinson, and C. I. Thornwill.

TIMEKEEPERS.—Messrs. A. V. Ebblewhite, A. G. Reynolds, and F. T. Bidlake.

ROUTE MARKERS AND VERIFIERS.—Messrs. G. E. Cuffe, E. B. Ware, and F. A. Hardy.

PRESS STEWARD.—Mr. Laurence H. Cade.

CLERK OF THE COURSE.—Mr. T. W. Loughborough, A.M.I.A.E.

Local office of the Auto Cycle Union.—Drill Hall, Llandrindod Wells.

BELOW a brief account of each day's run is given, the first man's time being backeted with the places mentioned on the official programme of the route. These notes will be useful to entrants and spectators alike. It should be remembered that allowing one minute intervals between the 114 competitors, almost two hours will be occupied by the trial in passing any one point.

First Day, Monday, September 15th, 98½ Miles.

As a kind of preliminary canter, the first day's route of the trial is comparatively short, and a start is not made until 2.30 p.m. Taking the main road to Builth (2.56 p.m. leader's time), the competitors head westward for Garth (3.15 p.m.), where, after a left turn, there is a long winding ascent. The consistent driving test is held here. Descending the valley of the Honddu to Brecon (4.11 p.m.), the course of the river Usk is followed on the right bank as far as Llangynidr (4.42 p.m.), where the eastern shoulder of the mountain of the same name is crossed by a series of bends and hills. Then to Brynmawr (5.7 p.m.), and so to Abergavenny, where tea will be in readiness at the Angel Hotel at 5.30 p.m. Lamps must be lit before restarting at 7 p.m., and the direct road for Talgarth (7.52 p.m.) is taken, which involves a stiff climb. From Talgarth to Llyswen (8.4 p.m.) the direction may be difficult to follow, but beyond the latter place the main road runs parallel with the railway and the river Wye to Builth (8.39 p.m.). The first man is due back in Llandrindod at nine o'clock.

Second Day, Tuesday, September 16th, 160¼ Miles.

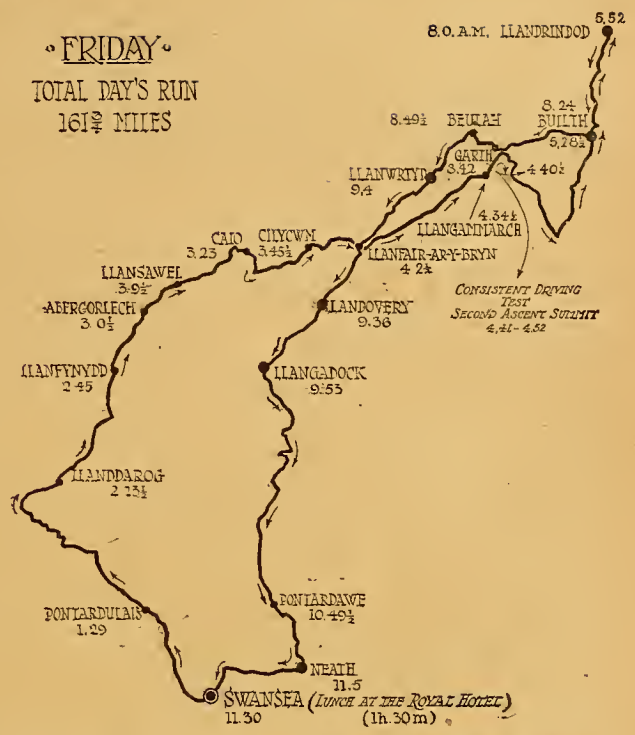
Having broken the ice, the competitors must rise betimes on Tuesday, for No. 1 will start down the Builth Road at 8 a.m., touching Newbridge-on-Wye at 8.14 a.m., Llanfanfawr 8.25 a.m., and Garth 8.42 a.m.

The main road is now taken through Llangammarch, a good run following through Llandovery (9.33 a.m.) and Llanwrda (9.46 a.m.), after which place, on a cross-country route, the brake test occurs. This part of the course and that through Llansawel (10.14 a.m.) to Llanbyther (10.40 a.m.) is not easy.

A stretch of the main road to Carmarthen ensues, but it is left after about fourteen miles for a cross-road to Bromwydd Arms (11.23 a.m.). Turning back on itself the route branches off again at Conwil Elvet (11.42 a.m.) over "uncharted courses." Newcastle Emlyn should be reached at 12.15 p.m., and after a lunch stop of an hour and a quarter a fairly easy run through Synod, Aberayron to Llansaintffraid follows. From this place past Cross Inn (2.46 p.m.), Ystrad Meurig (3.20 p.m.), Yspytty Ystwyth (3.35 p.m.), down the Elan Valley (4.20 p.m.) to Rhayader (4.57 p.m.) the road traverses the mountains of Central Wales, and if the competitors can spare an eye for the scenery this portion will seem impressive.

Third Day, Wednesday, September 17th, 152½ Miles.

The start from Llandrindod on Wednesday at 8 a.m. forms the commencement of one of the most difficult routes of the trial. Turning sharp right in Rhayader, a hilly stretch to Llanidloes is covered, after which a severe climb follows to Stay-a-little (9.37 a.m.).



Cemmaes Road Station brings another sharp turn, and the competitors head for Dinas Mawddwy (10.37 a.m.), after which comes the formidable Bwlch-y-Groes, at the top of which the first man, if he survives gradient and surface, is due at 11 o'clock. This point can easily be reached by spectators, as it is near Bala. Leaving Bala after lunch a mountainous cross-country road to Lake Vyrnwy is taken, Llanwddyn, at the southern extremity of the reservoir, being reached at 1.45 p.m., Llanfair Caereinion at 2.38 p.m., and Newtown at 3.12 p.m.

From Newtown *via* Dolfor to Beguildy a stiff climb with hairpin bends is encountered on the Kerry Hills, Knighton being reached at 4.17 p.m. The "main" road with some stiff gradients is followed to Llandrindod (5.15 p.m.).

Fourth Day. Thursday, September 18th, 159¾ Miles.

Leaving Llandrindod at the same hour, the leader crosses the railway and river and turns left for Newbridge-on-Wye. Passing straight through Builth some climbing is involved, and the route doubles back to Garth (9.22 a.m.). A few miles of by-road are traversed to Llanwrtyd (9.41 a.m.), after which the main road to Llandovery is used.

A tortuous stretch follows to Pumpsaint (10.48 a.m.), and a high range of hills is crossed in reaching Lampeter (11.18). An easier road by the railway is taken as far as Tregaron (11.52 a.m.), after which many hills and valleys are crossed in reaching Devil's Bridge (12.18 p.m.). Lunch is obtained there at the Hafod Arms Hotel, and a restart made at 2 p.m. Aberystwyth is entered at 2.35 and left *via* Bow Street (2.46 p.m.) for Machynlleth (3.29 p.m.). From here the mountain road over the northern flanks of Plinlimmon is taken, Stay-a-little, at the top of the climb, being reached at 4.10 p.m. A rough descent into Llanidloes follows (4.39 p.m.), and thence to Rhayader, by way of Tylwch, a road which crosses all the hills, is chosen. From Rhayader (5.17 p.m.) to Llandrindod (5.47 p.m.) is straightforward.

Fifth Day, Friday, September 19th, 161¾ Miles.

On this, the last day of the actual course, the route lies to the south of Llandrindod, the leader taking the main road for Builth at 8 a.m.

The lunch stop (1h. 30m.) is at the Royal Hotel, Swansea, where the first man should arrive at 11.30 a.m.

Moving off at 1 o'clock, the main road for Carmarthen is taken. After passing Llansawel (3.10 p.m.), the return route is a variant of the morning's troubles; beyond Caio (3.23 p.m.), Llanfair-ar-y-bryn (4 p.m.), and Garth (4.40 p.m.), being again touched. The Drum Ddu mountain road (leading to Brecon) is again the scene of the consistent driving test at 4.41 p.m., after which plain sailing ensues, through Builth (5.28 p.m.) to the finish at Llandrindod (5.52 p.m.).

Order of Starting.

Competitors will be started each day in the following order, and at intervals of one minute. The one minute interval will be maintained as far as possible throughout the trial.

CLUB NEWS.

Redditch and District M.C.C.

The provisional awards in the recent successful one-day open trial, which we announced on page 235 of the issue of *The Motor Cycle* dated August 28th, have now been confirmed with the exception of the members' prize for solo machines over 350 c.c. H. Poole (4¼ B.S.A.) was stated to have gained this award, but we now learn that it is subject to decision on protest, still under consideration.

Wolverhampton Inter-club Trial.

The results of the trial which we reported and illustrated in our last issue, page 262, are as follow:

TEAM PRIZE.—Wolverhampton M.C.C., consisting of W. H. Bishop (3½ Sunbeam), F. W. Giles (6 A.J.S. sc.), and A. Milner (2½ Diamond).

STEVENS CUP AND GOLD MEDAL.—F. W. Giles (6 A.J.S. sc.).

BEST INDIVIDUAL PERFORMANCE IN EACH CLASS.—Class 1 (under 350 c.c.): Gold medal, A. Milner (2½ Diamond); bronze medal, C. W. Jobborn (2¾ Sunbeam). Class 2 (over 350 c.c.): Gold medal, W. H. Bishop (3½ Sunbeam); bronze medal, J. A. Newman (3½ Sunbeam). Class 3 (unlimited sidecars): Gold medal, F. W. Giles (6 A.J.S. sc.); bronze medal, E. Williams (6 A.J.S. sc.).

Future Events.

Sept. 13.—N.M.C.F.U. (Wolverhampton). Run to Rudyard Lake.
Sept. 13.—Lincolnshire A.C. Hill-climb.
SEPT. 13.—LUTON AND S. BEDS A.C. OPEN SPEED TRIALS AT LUTON HOO.
Sept. 14.—Rochester, Chatham, and District M.C. Hill-climb at Hawkhurst.
Sept. 14.—N.M.C.F.U. (Leeds).—Run to Fountain's Abbey.
Sept. 14.—Manchester M.C. Speed Trials.
SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.
Sept. 19.—Essex M C. Gymkhana.
Sept. 20.—Blackburn and District M.C.C. Hill-climb on Waddington Fells.
Sept. 21.—Rochester, Chatham, and District M.C. Treasurer's Surprise Run.
Sept. 21.—N.M C.F.U. (Leeds). Run to Boroughbridge.
Sept. 27.—Coventry and Warwickshire M.C. Hill-climb.
SEPT. 27.—WOLVERHAMPTON M.C.C. OPEN HILL-CLIMB.
SEPT. 27.—SCOTTISH A.C.U. SPEED CHAMPIONSHIPS AT ST. ANDREWS.
Sept. 27.—Exeter M.C. and J.C.C. Trial.
Sept. 28.—Rochester, Chatham, and District M.C. Consumption Test.
Sept. 28.—The Scott Sporting Trial.
Sept. 28.—N.M.C.F.U. (Leeds). Scott Trials (Charleston).
Sept. 28.—N.M.C.F.U. (Wolverhampton). Run to Crackley Bank, Wellington.
Sept. 28.—Manchester M.C. Closing Run
Oct. 4.—Essex M.C. Hill-climb.
Oct. 4.—Birmingham M.C.C. Captain's Day.

Bath and West of England.

The Bath and West of England Motor Club's hill-climb, to decide the holder of the Fuller Cup for this season, will be held at Weston Lane, Bath, to-day, at 6 p.m.

Ilkeston and District M.C.C.

A hill-climb was held last week at the Pig of Lead hill, near Matlock. Several members of the Nottingham M.C.C. acted as officials. The hill was extremely rough. Two classes were run to form a basis of handicapping in the final, which was won by W. B. Myhill (4¼ B.S.A. sc.) from A. Calder (4¼ Campion).

N.M.C.F.U. (Leeds).

Members of the Leeds branch of the National Fuel Union again organised an outing for limbless patients.

Over a hundred vehicles, chiefly sidecars, recently took a party of 160 to Knaresborough, and provided tea there. The expenses were borne by the members, more than £60 being raised by subscription.

A Sporting Hill-climb at Sutton Bank.

York and District M.C. Open Event.

SUTTON Bank, after a lapse of many years, has once again been the scene of an open hill-climb. The famous gradient, which occurs between Thirsk and Helmsley on the main road over the Hambleton Hills, has no doubt lost its terrors, and in these days is not such a suitable place of contest as it was in the days when the ability of the competing machines to reach the summit was largely a matter of doubt.

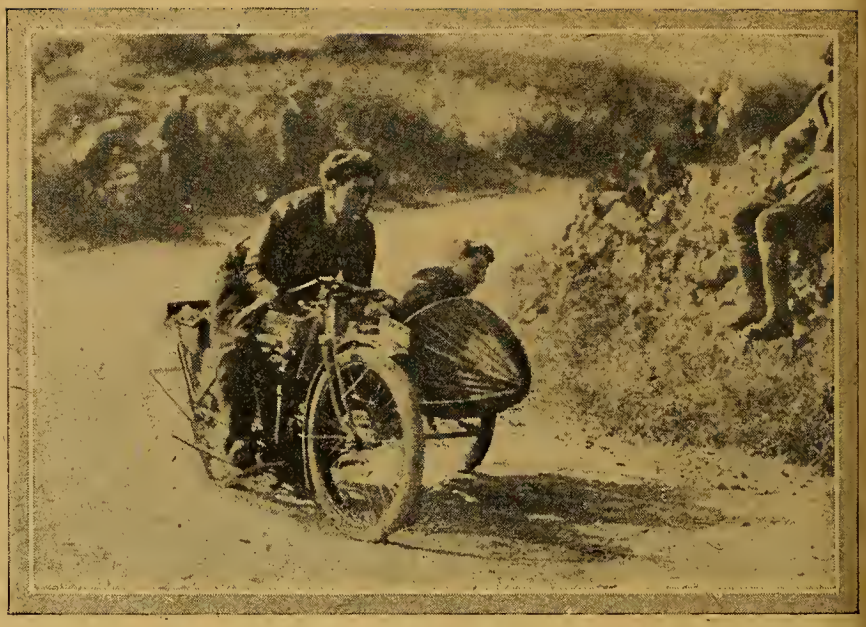
Indeed, when we now realise that even the lightweights are too fast for the hair-pin bend, a certain feeling of regret overcomes those of us who remember the days when ability to make an unassisted climb placed one in the position of the pioneer. However, *tempora mutantur sic breviora fiunt*, and the notorious hill parted with its one-time terrors on Saturday when O. G. Benson rode to the summit in under three minutes on a scooter. He was the sole entrant in his class, and so had a walk-over. His speed was quite good, and the stand-up position did not appear to be in any way detrimental to his cornering or steadiness on the rough patches.

Surface Improved.

The road condition, incidentally, was much better than of yore, as the timber waggons which cut up the surface a few years ago have now been supplanted by an aerial ropeway from the summit.

A start was made at 1.30 p.m. by the above-mentioned ascent of the Autoglider, followed by the 275 c.c. lightweight class, in which O. E. Carter, on a 198 c.c. Levis, successfully surmounted the hill, despite his single gear. He was well beaten, however, by A. Proctor, riding a Junior Triumph, which, stripped for the purpose, evinced a great turn of speed.

The left-hand hairpin on Sutton Bank worried the sidecarists. This is how G. Grinton's passenger assisted the Harley-Davidson around the bend.



A victor in the York M.C. open hill-climb at Sutton Bank. F. W. Dixon (7-9 Indian) who made fastest time in solo and sidecar classes

A Spectacular Performance.

In the 350 c.c. class there were only three starters, the fastest being G. S. Boston, who, despite a skid on the bend, which compelled him to turn completely round, ride down a little way, and turn again to complete the climb, was able to beat the next man by 26s. His 2¾ h.p. A.J.S. was clearly too fast for the part of the hill containing the hairpin.

The Advantage of Four Speeds.

Emerson on the A.B.C. now had his opportunity amongst the 500 c.c. entrants, and the penetrating crackle of the open exhaust as his mount screamed up the almost mile-long climb, was punctuated by the frequent changes of gear as he took advantage of his four speeds on every variation of gradient. Amongst the 750 c.c. entrants, the A.B.C. again was fastest, but Capt. Geo Walker (4 Triumph) rode well, taking the bend on middle gear with a roar. Two Brough 5 h.p. flat twins in this class were very slow and failed to pick up speed after rounding the hairpin.

The Star Performance.

It remained for F. W. Dixon (7-9 Indian) to put up the star performance of the day, both as regards fastest time and superb riding. His acceleration up the first steep climb was no less remarkable than his judgment in negotiating the hairpin, while the manner in which he shot up the final stretch called forth a spontaneous burst of applause. His average speed was 39.4 m.p.h., that of Emerson, on a machine of less than half the capacity, being over 37 m.p.h.

Only five sidecars started in the two classes, and their performance calls for little comment; the two A.J.S. machines simply toured up, but Dixon (7-9 Indian) again put up a beautiful climb.

Of the cycle cars, F. J. Willmott (Morgan) was quite slow. Capt. Nash (10 G.N.) was tremendously fast, equalling many of the solo motor cycle performances, while Cawthorne (9 Gillyard) was also very speedy, but, unfortunately, was not timed and did not elect to make a second attempt.

The Results.

Length of course, $\frac{9}{10}$ mile. Average gradient, 1 in 8

CLASS 1.—SCOOTERS

	Time. m.	s.
O. G. Benson (2¾ Autoglider)	2	51⅘

CLASS 2 AND 3.—UP TO 275 C.C. (AMATEUR AND OPEN).

A Proctor (2¼ Triumph Junior)	2	47
O. E. Carter (2¼ Levis)	3	4⅕

CLASS 4.—UP TO 350 C.C. (OPEN).

G. S. Boston (2¾ A.J.S.)	2	0⅕
E. Wasling (2¾ Coulson-B.)	2	26⅕
F. Reynard (2¾ Douglas)	2	58⅕

CLASS 5.—UP TO 500 C.C. (OPEN).

J. Emerson (3 A.B.C.)	1	27⅘
G. S. Boston (2¾ A.J.S.)	1	39⅕
B. W. Edmonson (3½ Chater-Jap)	1	50⅘

CLASS 6.—UP TO 600 C.C. (AMATEURS).

G S Boston (2¾ A.J.S.)	1	51⅕
B. W. Edmonson (3½ Chater-Jap)	1	52⅕
C. E Birdekin (4 A.J.S.)	2	17⅘

CLASS 7.—UP TO 750 C.C. (OPEN).

J. Emerson (3 A.B.C.)	1	27⅕
G. Walker (4 Triumph)	1	57⅕
J. R. H. Knight (5 Brough)	2	6⅘

CLASS 8.—UP TO 1,000 C.C. (OPEN).

*F. W. Dixon (7-9 Indian)	1	22⅕
J. Emerson (3 A.B.C.)	1	32
G. Grinton (7-9 Harley-Davidson)	1	45⅖

CLASS 9.—SIDECARS UP TO 500 C.C. (OPEN).

CLASS 10.—SIDECARS UP TO 750 C.C. (OPEN).

W. E. Grange (4½ B S A sc.)	2	33⅘
A. R. Crowe (5-6 A.J.S. sc.)	3	21
W. E. Haddon (5-6 A.J.S. sc.)	3	48

CLASS 11.—SIDECARS UP TO 1,000 C.C. (OPEN).

F. W. Dixon (7-9 Indian sc.)	1	41⅕
G. Grinton (7-9 Harley-Davidson sc.)	1	49

CLASS 12.—CYCLE CARS.

A. F. Nash (10 G.N.)	1	34⅖
F. J. Willmott (8 Morgan)	3	22⅕

* Fastest time of day, winning Triumph Cup.

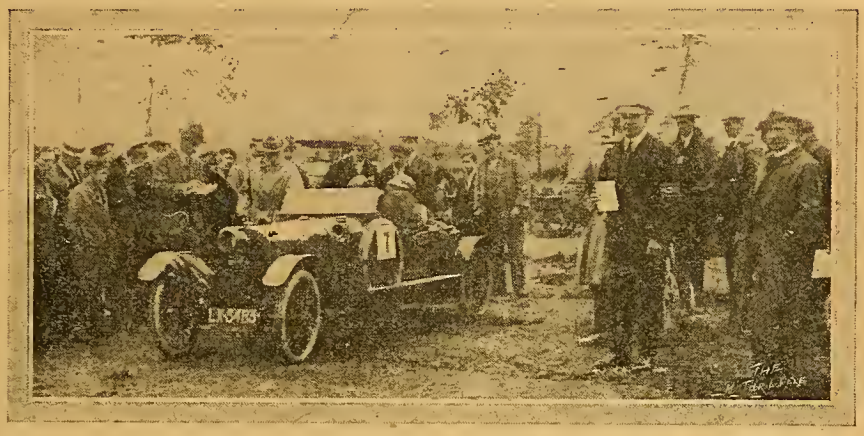
The Junior Car Club's General Efficiency Trial.

Thorough Series of Tests to find Weaknesses of Design and Performance.

WITH a total entry list of thirty light cars and cycle cars, a comprehensive one-day programme was carried out by the Junior Car Club in the general efficiency trial in the Haslemere and Liphook district on Saturday last, September 6th. In addition to a general reliability run over a circuitous route of some sixty miles (in which there were five hill-climbs), the competing cars were put through the following tests: Steering, petrol consumption, starting from cold, speed hill-climb, slow running, acceleration and brakes, restart on hill, and noise, while the programme was completed with an examination by the judges of the condition of each car after the trial and tests. Each event on the programme counted for so many marks, the total number obtainable being 100.

Cycle Cars Excel on Hills.

The cycle car class was represented by three 8 h.p. Gordons, two 10 h.p. G.N.'s, and one 8 h.p. Morgan, and, although the trial was severe in a number of respects, a good performance was put up by the cycle cars as a whole, particularly in regard to the hill-climbs included in the course.



A 10 h.p. G.N. at the start of the sixty miles road test in the Junior Car Trial last Saturday. Sir John Nixon and Col. C. Jarrott (judge) are seen on right of photograph.

The hills encountered on the reliability run were: Bowler's Green Hill, Blackdown Hill, Linchmere Hill, Pitfold Hill, and Hollycombe Hill, the restart test being held on the last-named in conjunction with the noise tests carried out by Dr. A. M. Low with his Audiometer.

Map showing the area covered by the Six Days Trials. Motor cyclists who desire to observe the competitors may see at a glance the point nearest their own home. Reference should be made to the detail maps for the actual course, as some of the route here shown in dotted line is covered twice.

5,000 MILES BENZOLE TEST.

TO-DAY at 3 p.m. a 4 h.p. chain-driven Triumph sidecar will start from the head offices of the Automobile Association for a 5,000 miles test, under ordinary touring conditions, to show that approved benzole is a satisfactory fuel for motor cycles, also for cars having air-cooled engines.

As in the case of the 16 h.p. Sunbeam car, which is now undergoing a similar road test of 10,000 miles, this test will be carried out under conditions which will preclude all possibility of doubt or criticism as to its genuineness and the finality of its results.

The machine is new and straight from the makers' works. The engine will be taken down at the works before the test, and examined by a competent authority.

At the suggestion of the Institute of Automobile Engineers, Mr. R. S. Fox has been appointed as official examiner, while the benzole used throughout the run of 5,000 miles will be N.B.A. brand of approved specification.

PROFITEERING.

WE understand that the question of profiteering in motor cycles and sidecars has for some long time been engaging the attention of motor cycle manufacturers, and the Cycle and Motor Cycle Manufacturers' and Traders' Union, Ltd., has been considering the various steps that can be taken to deal with this matter.

It is possible that there are at present a number of agreements between individual manufacturers and agents still in force dealing with this season's goods, but the Manufacturers' Union have recommended their members to adopt such wording in future agreements as will secure that the agent shall not profiteer when selling manufacturers' products to the public.

THE M.C.C.

A Successful Event. Keen C

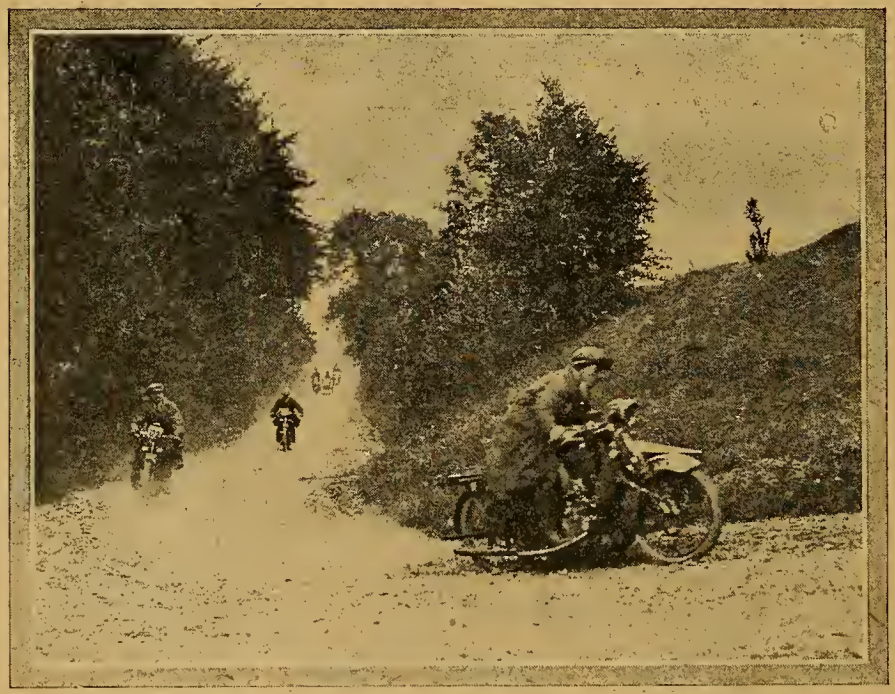
J. Haslam (Douglas), of the Sheffield and Hallamshire M.C.C., near Pink Hill.

BEAUTIFUL weather and a really sporting course helped to render the team trial on Saturday last a splendid success. Arriving at Tring at 11 a.m., we found the open space opposite the comfortable "Rose and Crown" Hotel thronged with competitors' machines, among which were several quite interesting mounts. There was a new 8-10 Henderson and sidecar, one of the most recent models, lately described in these pages. The six Scotts of the Ilkley M.C.C., all fitted with two-gallon petrol cans on the carriers connected up to the main tanks had twin lubricators to the separate halves of the crank case. Here we saw Longfield, the well-known pre-war Scott exponent, acting as observer, since wounds suffered in the war prevent him from handling a motor bicycle. There was also a handsome 4 Triumph outfit equipped with disc wheels. Major Chater-Lea, recently returned from the Balkans, was there as a spectator on a No. 7 sidecar outfit with spring frame, a model, by the way, which his firm is temporarily abandoning for the 1920 season.

There was only one unfortunate incident, and that was that in certain earlier copies of this journal, it was stated in error that the start was to have been at Potters Bar. Every possible effort was made to correct this unfortunate slip, but, so great is the influence of *The Motor Cycle*, that, despite advertisements inserted in two prominent daily papers, several riders went astray. Further, to help those who might have gone to Potters Bar, notices were sent to the R.A.C. and A.C.U. touring guides and to the A.A. scouts, and a representative of *The Motor Cycle* was sent to Potters Bar to direct any who might have gone astray at the point.

In practically every case the teams were most carefully selected and contained first-class riders, but, owing to the severity of the course, and the activity of the puncture fiend, casualties w exceedingly heavy.

W. G. Boyes (Triumph) and F. W. Douglass (Sunl



Some of the Ilkley team going well. All were mounted on Scotts, and, after a good performance, finished second.

A Sporting Course.

The course was of quite a differ nature from those previously selec for this event, being more of the nat of an A.C.U. one-day trial route. was a course which was ideal for find a winner, and Mr. F. T. Bidlake, doyen timekeeper, deserves our heart congratulations on choosing so suita a route. The Motor Cycling Club been too closely wedded to findin winner in the past by awarding lau to the teams who have been able to h to schedule time most closely—a mat which is unsatisfactory from many po of view, and chiefly because the elem of luck enters into it to a consider extent. This year, the M.C.C. wi adopted a different principle, which heartily appreciated by everybody; course was a stiff one, and a consis driving test, a very novel, interesting fascinating method of selection in of a dead-heat was adopted. This, h ever, was not required, as the co alone found the winning team. start was at 1 p.m. on a straight turning off from the Tring-London R The competitors were arranged acc ing to teams, and the marshalling most ably carried out by Major L. Baddeley, M.C., who saw that the teams were in their proper order and they moved up ready to depart as as the team in front had been despatc The timekeeping at the start and fi was carried out by Messrs. W. H. V and J. Ogilvie.

Soon after the start, the compet proceeded to New Mill, where a s

M TRIAL.

r "The Motor Cycle" Cup.

Trial for *The Motor Cycle* Cup last Saturday.

) the left was taken. This was :hed too fast by one competitor, :n into the bank, had a bad fall, oke his leg. The Icknield Way llowed to the top of Tring Hill, which the first turning to the left, to Halton, was taken and so to Hill, on which the consistent driv- t was held. This was quite interest- watch, but, as may be expected, were only one or two failures, G. Glashan, Woolwich Plumstead and t M.C.C., whose engine dried up hill, and S. W. Phillpott (Brough). or so further on a sharp turn to ght was followed by a precipitous t over a rough surface which ghly tested the brakes. At the the road was bumpy for about a out improved later. Then came a turning to the left, after which n were directed by a marshal over way bridge, up a long easy climb, nsmore. Then down another pre- a hill, on to a grassy lane in fairly nder, up an easy ascent, and then a fairly steep gradient past the entrance to Chequers Court, the ce recently presented to the Minister and his successors.

Punctures Plentiful.

a few miles the road was quite It turned left at Butlers Cross ed towards Princes Risborough, before which the marshal directed n up Whiteleaf Cross hill, the best of the day. All the rough, steep had flinty surfaces and caused ous tyre troubles. At the top of ll the course was directed over the to the right and led down Kop he scene of many famous competitions. Pink, Hill, with its severe hairpin bend, was then climbed, and the course lay through Hampden Park to Kemble. Just short of Missenden we turned to the left and followed the Wendover Road for about a mile. The starting point was finally reached *via* Lee, St. Leonards, Cholesbury, and Wigginton.

A Mischievous Trick.

The route was most efficiently arrowed, and all important turnings were guarded by marshals. Only at one point was there any difficulty, and this was a mile or two above the summit of Aston Hill, where an arrow had been turned, apparently by some evilly disposed small boy, on the second circuit. Those who were led astray (and they need not have been, because all *red* arrows showed turnings to the right) reached the rest of the course in two miles at St. Leonards, and so cut short their journey by less than a half.

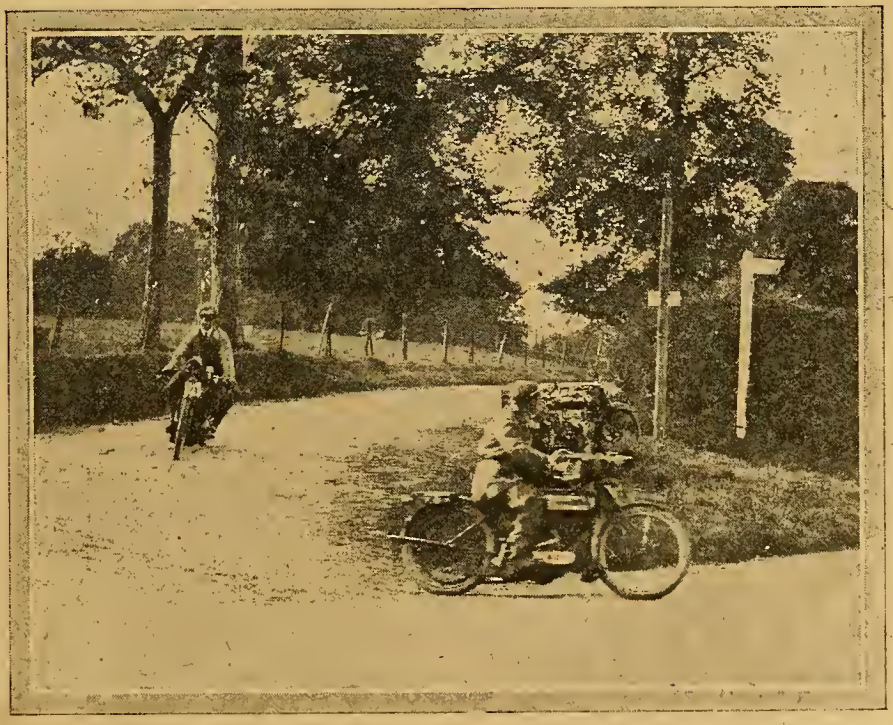
The circuit described was thirty-two and a half miles in length, which, covered three times, made a total of ninety-seven and a half miles. It traversed beautiful country, and was a most efficient test. There could be no better course than this covered in the reverse direction for next year's team trial, as the hills descended seemed worst than those ascended, and Kop Hill would serve admirably for the consistent driving test.

Two of the Essex sidecars near Tring.

Results.

Of the clubs entered the Coventry and Warwickshire M.C.C. was the only one to finish with a complete team. Both this club and the M.C.C. are now in the running for the winning of the cup outright, as both have now won the trophy on two occasions. The winning team was composed of the following riders :

S. Wright (3½ Humber).
R. B. Ewens (3½ Rudge Multi).
W. Brandish (5-6 Rover).
H. Finch (4 Triumph).
B. Ryecroft (4 Triumph sc.)
F. G. Edmond (4 Triumph sc.)



A Triumph rider taking a bend in good form on the Wendover road

The Coventry team, winners of *The Motor Cycle* Challenge Cup for the fifth time.

Edmond's Triumph was a chain-driven model with a brake shoe applied to a V drum on the front wheel. Next in order came the Ilkley M.C. and L.C.C. All were mounted on the same make of motor cycle.

J. E. Walker (3¾ Scott).
W. Haggas (3¾ Scott sc.)
W. Moore (3¾ Scott).
W. L. Guy (3¾ Scott sc.)
H. W. Sellers (3¾ Scott).
W. F. Scott (3¾ Scott sc.)

Haggas retired at thirty-seven miles. The organising club, the M.C.C., took third place.

V. Olsson (4 Douglas).
E. A. Bridgman (7 Indian sc.)
P. W. Moffat (4 Douglas).
B. A. Hill (8 Morgan).
S. J. Watson (6 Ariel sc.)
R. B. Clark (2¾ Douglas).

Among the unfortunates in this team Olsson punctured near Missenden.

The fourth team was the Woolwich, Plumstead, and District:

T. J. Ross (4 Triumph).
G. D. Hardee (8 Matchless sc.)
R. Boner (4 Triumph).
B. J. Sims (4 Triumph).
F. J. Ellis (8 Matchless sc.)
S. A. Ive (4 Triumph).

NOTES ON THE COURSE.

Of the Middlesex M.C.C., D. H. Noble arrived late, was heard of in Tring, and G. L. Fletcher went to find him. They arrived just after starting time; neither was allowed to depart, and the club did not compete. The Essex M.C. team, quite a strong one, suffered severely with tyre troubles, while the Sheffield and Hallamshire Club members were similarly unfortunate. Of the former club, Pearson (2¾ Douglas) punctured at the sixty-eighth mile, Bax at the third mile, and Leslie was another puncture victim, while of the latter club Raynes punctured at the twentieth mile. Of the South Birmingham M.C.C., Dalby (Triumph) and Clulee (Allon) were seen returning to the start during the third lap. The Public Schools M.C.C. started with a man short. Davey (Norton) had a fall near Lee, Wright (Harley-Davidson sc.) ran out of petrol almost in sight of home, Tweedie (Zenith) punctured after doing eight miles, leaving only Boileau (8-10 Henderson sc.) and Watson-Bourne (Blackburne) to make non-stop runs. The teams in the running at the end of the first lap were Coventry and Ilkley; at the end of the second and third laps the Coventry team was the only complete one left.

TEAM TRIALS TRIFLES.

Not quite so many teams put in an appearance this year, but next summer no douht club life will be in full swing.

The club champions of 1919—the Coventry and Warwickshire Motor Club—has been somewhat in the background since the war, as no open events have been organised, nor is the club affiliated to the A.C.U. this year.

Potters Bar! There was much good natured chaff at the real starting point, near Tring. Just five lines in *The Motor Cycle* were sufficient to send many riders to Potters Bar, and not even prominent announcements of the correct starting point in the leading London dailies, the programmes, coupled with the assistance of R.A.C. and A.A. road scouts, could stop them. If we were oblivions of the inconvenience caused, we might be tempted to instance the power of a brief announcement in *The Motor Cycle* against such an array!

The Ilkley riders, generally referred to as the Scott team, put up a fine show. Earnest preparations had been made for a win, and it was only a sooted plug which spoilt the team's 100% record. Second place is not to be despised, however.

Had the course been selected for a one-day trial by the A.C.U. no one would have been surprised at the hills included. The M.C.C. are to be congratulated upon stiffening the conditions for this club championship event. Weeding out the riders by a difficult course is far better and more sporting than timing to split seconds over an easy route.

When Mr. Head returned from arrowing the course in the morning, with Messrs. W. H. Wells and F. T. Bidlake, he remarked to us that the first round would settle the destination of the cup. He was not far wrong, for only two teams were complete at the end of the first circuit.

THINGS WE WANT TO KNOW

What *did* happen to Vivian Olsson in the first lap?

Why the "arranged" stop in the second lap never took place?

Why the M.C.C. officials scurried home immediately after the finish without announcing the results?

If the disc wheel Triumph was not really attractive?

If the Six Days trials riders will lower their emergency gears after Saturday's experience?

If Coventry does not deserve some handicap another year?

If the petrol tin shortage was not explained when the Scott team arrived each with a spare tin on the carrier?

Why the Scott lubrication system was different on each machine entered?

If the competitor who started with a loose gear box has tightened it yet?

If the flat twin Harley ridden by Lt. Norman Mitchell did not create a most favourable impression?

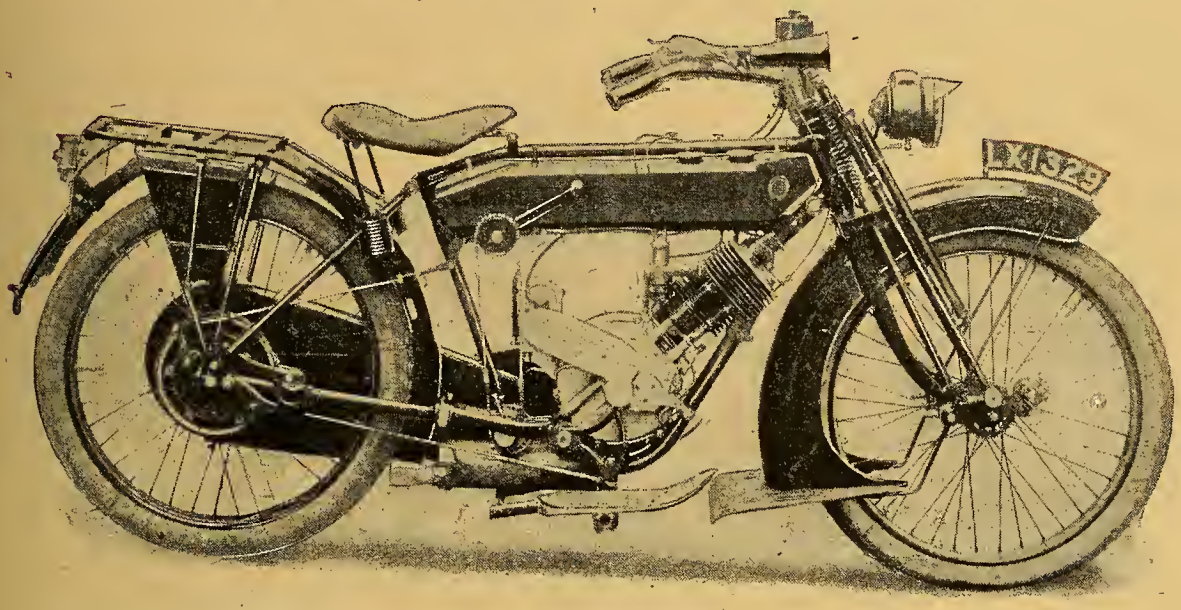
If the Coventry Club will "feast" their winning team?

If Phillpott's luck in finding a sharp flint within four miles after riding his Brough 200 miles to take part was not the limit?

If the culprit who turned the arrow on the second lap, and so led Birmingham and Oxford astray, will confess?

THE 1920 3½ h.p. P. & M.

Newly Designed Kick-starter. Mechanical Lubrication.



The 1920 P. and M., to which several improvements have been made. Entirely newly-designed forks and brakes are to be fitted on next year's model.

ONE of the most successful motor cycles with the British Army at the Front was the P. and M., which did wonderful service in the hands of the R.A.F. despatch riders from 1914 onwards. We have often spoken of the war as the most wonderful reliability trial which ever took place; in it the P. and M. was a prominent and successful competitor, and Messrs. Phelon and Moore have learned much that was of value to them in the five strenuous years during which it lasted.

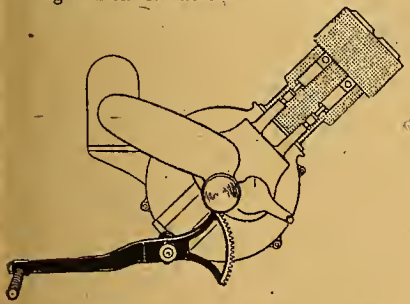


Diagram of the new kick-starter. The long leverage will be noted.

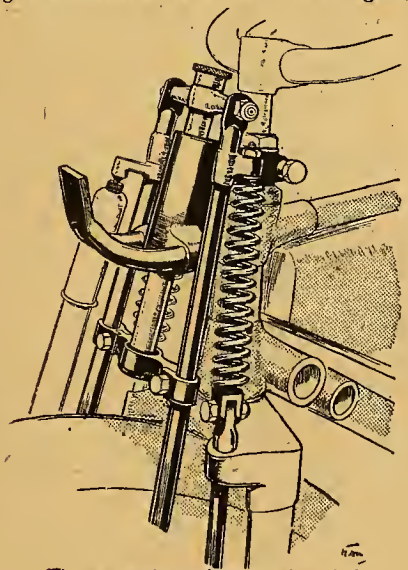
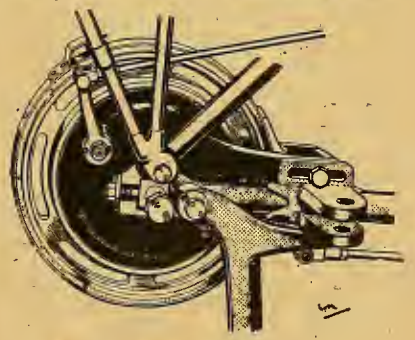
The new 3½ h.p. model has not undergone any startling alterations as regards design, but there are important detail improvements which will be heartily appreciated by the many enthusiastic riders of this famous machine. The latest model is fitted with larger tyres, and has wider and more efficient mudguards, while another innovation is to be found in the brakes. There are two brakes, one internal expanding, and the other external contracting, both in the rear wheel, and of these the external brake is fitted on to a short spoked drum, and is controlled by a pedal actuated by the rider's heel on the left side of the motor bicycle. The internal expanding brake is controlled by a hand lever working on a ratchet quadrant, also on the near side of the machine. This is a very valuable fitment, as when a sidecar is fitted it enables the driver to secure his machine, no matter how severe may be the gradient on which it is desired to stop. To release the hand brake it is only necessary to slide forward the aluminium handle. Machines which are not equipped in this manner when required to stop on a gradient have either to be left in low gear, or one of the wheels has to be run into the kerb or into the bank at the side of the road. With the P. and M. fitting, however, restarting or stopping on a hill is a simple matter.



The new spring fork suspension of the 1920 P and M

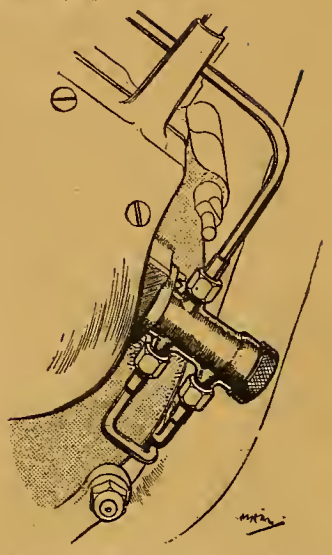
Shorter engine lugs are now provided, so as to allow of the cylinder being dropped more easily for purposes of dismounting it for decarbonisation. The compression tap is now far more accessible, being placed on the near side of the cylinder head, and not in the centre as previously, while a most important innovation is the fitting of a mechanical oil pump designed to draw its supply from the conventionally situated oil tank and maintain a constant level of oil in the crank case. This is provided with two leads, one of which introduces oil to the front of the cylinder, while the other introduces it to the near side main shaft bearing.



Internal expanding and external contracting brakes on the rear wheel.

As before, Messrs. Phelon and Moore, Ltd., favour the B. and B. carburetter. The silencer is of ample dimensions, and

The 1920 3½ h.p. P. & M.—



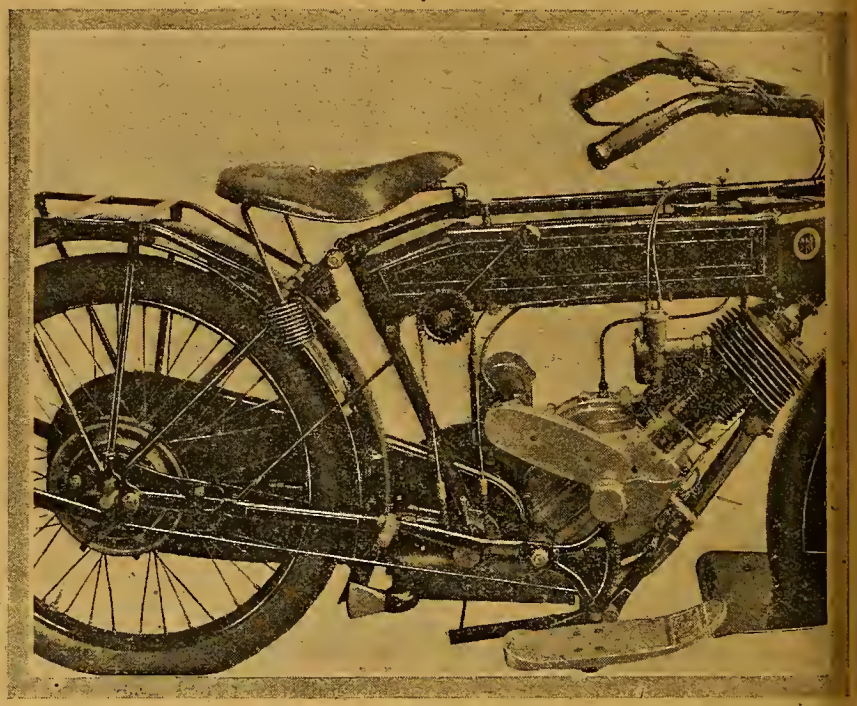
Position of oil pump on timing case of P. and M. engine. The pump forces oil to the big-end bearing and cylinder walls.

is provided with a short extension pipe.

The spring forks have been entirely redesigned, and, instead of the central enclosed springs in compression, two separate coil springs in tension are provided. The fork is also much stronger, and all moving parts are provided with grease cups of ample size.

The comfort of the rider has been well studied, and the machine is now fitted with a Brooks No. 175 saddle, which is sprung both at the back and at the peak, and supported on the machine in these two places instead of by the usual saddle-pillar in the centre. The sidecar lugs are built into the frame, and rear lugs are placed on both sides of the chain stays, so that the sidecar may be fitted on either side of the motor cycle. Yet another novelty is the kick starter, which has been entirely redesigned. It is now of the rack and pinion type, the latter being partially protected, while the lever to which the kick starter pedal is attached is long, and the whole mechanism is of very substantial construction.

Needless to say, the new model P. and M., both as regards external finish and cleanliness of crank case is quite up to its excellent predecessors. These machines will be used in the Six Days Trials, which begin on Monday next.



Alterations immediately noticeable on the new P. and M. are—(1) the tank, now slopes slightly at the rear; (2) the starter pedal, which can now truly be described as a "kick" starter, is placed further back; (3) a newly designed expanding brake has been added. A mechanical oil pump, too, will be noticeable on the timing gear case

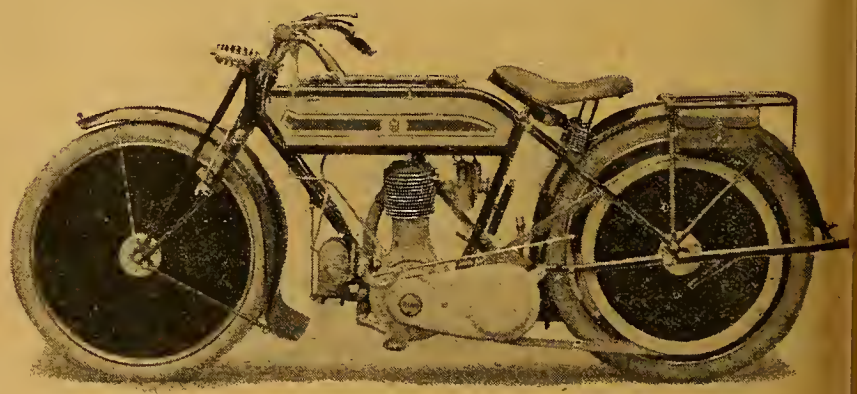
Disc Wheels on Solo Machines.

The Question of Convenience, Appearance, and Windage.

THERE is no doubt that disc wheels, or wheel discs, to be more correct, are increasing in popularity, and although opinion, at present, may be divided as to whether they render a machine's appearance clumsy or smart, approval on the score of cleanliness is apparently fairly general.

The first-mentioned difference of opinion has probably been caused by the many ill-fitting discs to be seen on even new machines, and which by no means enhance their appearance. There are few things which look worse than discs which have buckled surfaces or are fastened to the wheel by rusty nuts and bolts.

However, the latest wheel discs, such as are produced by the makers of the Ace in Coventry and the Chelsea Aviation Co., remove these objections. The former disc is secured by central flanges, while the latter has recesses to take the nipples of the tensioning bolts.



A smart solo Triumph machine fitted with "Ace" disc wheels. Note the neat flange fixing and the clean rear wheel. The disc before being fitted to the wheel is pierced to receive the connecting spokes for the belt rim.

Any motor cyclist who has seen the latest examples of wheel discs will agree that they are smart. It is obvious that they render a wheel easier to clean and, therefore, have utilitarian value. There remains one other query which is frequently raised. Do they seriously affect the steering in a strong side wind? Obviously the question is of greater importance to the rider of a solo machine than to the driver of a sidecar.

Personally, we have not noticed any appreciable difference when riding or driving a machine fitted with disc wheels, neither have we heard of many cases where owners have discarded their discs for this reason, but the views of motor cyclists who use them, or have used them, would be of interest at the present time, and, for that reason, we invite readers to express their opinion on the subject.

New York to Chicago Record.

Scherer, riding a 6 h.p. flat twin sports model Harley-Davidson, has, we are informed, ridden from New York to Chicago in 31h. 24m., breaking the record by 10h. 56m.

A Sensible Amendment.

The speed limit throughout the Province of Ontaria has been increased from 15 to 20 m.p.h. in towns and villages, and from 20 to 25 m.p.h. on open country roads.

Over £159,000,000!

According to the latest official return, the value of the surplus Government property already sold is £159,806,177. Recently in one week alone the following amounts were realised: mechanical transport, £270,739; ferrous metals, £275,050, and £421,290 for non-ferrous metals.

The total amount received in the sales of mechanical transport up to date is £2,325,604.

Motorphobia in Switzerland.

The use of motor cycles is prohibited in Geneva (Switzerland) on Sundays and fête days from September 1st to October 31st between the hours of 1 and 6 p.m. From 6 a.m. to 1 p.m. the speed of all motor vehicles is restricted to twelve miles an hour in the whole of the canton of Geneva. The police and military owners may continue to use their motor vehicles without restriction.

A Two-stroke Exponent.

Those who recall Frank Philipp's performances on a Scott two-stroke machine in past T.T. and Six Days' Trials, will learn with interest that after a long spell in the engineering industry, apart from the motor trade, he has resolved to return to his first choice. At the moment he is not definitely fixed in either the car or motor cycle worlds, bnt his name will be a welcome addition to the lists of competitors in leading events.

Continental Road Conditions.

We have recently received a note (dated in Brussels) from Mr. Leonard B. Henderson, A.M.I.A.E., the sidecar manufacturer, of Sheffield, who is obtaining first-hand information regarding conditions of trade in Europe. Mr. Henderson is riding a 4 h.p. Norton with his own Elite sidecar, and tells us that the road conditions in Northern France and Belgium make sidecarring almost impossible with a rigid-frame outfit.

The Late Captain F. C. Mocatta.

Captain F. C. Mocatta, A.M.I.C.E., who died on Augnst 25th, aged 29, was well known as a motor cyclist, and joined the Army in the early days of the war. He was edncated at Clifton College, and at the City Guild's Engineering College, where he obtained his B.Sc. He took part in the Gallipoli campaign, and served in Egypt and France, but afterwards broke down in health, and lately became attached to the Aircraft Prodnction and Snpply Department. He obtained awards in the London-Edinburgh and London-Exeter Runs. We remember in 1916 that he showed us with great pride two Bosch sparking plugs in his 2¾ h.p. Douglas, which were taken from the first enemy airship brought down in the British Isles.

Special Features.

GUIDE TO SIX DAYS TRIALS.
THE M.C.C. TEAM TRIAL RESULTS.
AMERICAN NEWS LETTER.

Leicestershire Roads.

The daily and evening papers are remorselesss in pointing out, almost every week, that Leicestershire possesses some of the vilest roads in the Kingdom.

Race in Northern France.

The motor cycle race organised by l'Union Sportive Stéphanoise will be held in the district of St. Etienne on September 14th. The course includes a hill-climb on the Côte de Planfoy with an average gradient of 1 in 10.

Traffic Tactics.

In the current issue of *The Autocar* a special article appears on "Traffic Tactics," with special photographs and diagrams. Although primarily for car owners, the varions hints and information would be useful to motor cyclists, especially sidecarists.

Motor Cycles taken into France.

The dnty on motor cycles taken into France has been considerably reduced, and now stands at 220 fr. per 100 kilos, multiplied by 1.3, which is a coefficient of increase. The *ad valorem* Customs snrtaxes are now removed, and the tariff rates of dnty in respect of a large number of commodities are to be multiplied by a figure known as "coefficient of increase," which is calculated in each instance to represent the relation the official valuation of the goods of 1918 bears to the corresponding valuation of 1913.

Members of the Ilkeston and District M.C.C. on the occasion of their recent hill-climb at Pig of Lead Hill.

Average Second-hand Prices.

During the period of abnormal demand for motor cycles, the prices of second-hand machines have rested upon an adventitious basis. Values have been fixed rather by the anxiety of the buyer for possession than by actual worth.

Such being the case, we discontinued our lists of average prices, as it was no longer possible therein to reflect truly the marketable values of the machines dealt with. Of late, however, we notice a levelling up of the figures demanded by the sellers of identical machines; the demand, too, is being more fully met, and generally the outlook is being stabilised.

In compiling the list of average values herewith, early models have been ignored, and in most cases 1913 and 1914 models are grouped, and where no date is given it may be taken that the war and post-war models are averaged, when the latter show no great dissimilarity of price.

Coventry and Warwickshire Club Hill-climb.

September 27th has been fixed as the date for the Coventry club's hill-climb, which will be held on a hill within easy riding distance of Coventry. This year it is a closed event, but interested motor cyclists may become members by payment of 10s. annual subscription.

The classes will include scooters, motor cycles up to 275 c.c., 350 c.c., 600 c.c., and unlimited, sidecars and cars.

The entry fees are 5s. for solo machines, 7s. 6d. for passenger machines, and 10s. for cars.

A valuable silver challenge cup is being offered for the fastest time of the day.

Entry forms will be ready in a few days, and will be obtainable from the hon. organising secretary, Mr. E. J. Appleby, "Llanwrtyd," Osborne Road, Earlsdon, Coventry.

At the recent hill-climb held by the Southend-on-Sea and District Automobile Club a scooter class was included, the fastest time being made by Miss Keddie (on left) on an Auto-glider. Miss Cummings (on the right) is seen mounted on an A.B.C. Mota-scoota

Machine Gun Carriers at a Guinea!

Two sales of Government motor vehicles, conducted by Messrs. Cooper, at Newcastle, realised in the aggregate over £20,000. At one sale twenty-seven motor cycles realised 660½ guineas, and two machine gun carriages were sold at one guinea each, a third realising one and a half guineas. The top price reached for a motor cycle and sidecar combination was seventy-five guineas for a Clyno.

Scottish Speed Championships.

The Scottish Auto-Cycle Union will once again hold the Scottish Motor Cycle Speed Championships on the sands at St. Andrews. September 27th is the date fixed, and the start will be at 10 a.m. There are fourteen classes, three being for light, medium, and heavyweight championship respectively, over a twenty mile course. Classes for private owners and a ladies' one mile handicap are also included. The Scottish Inter-club Relay Team Race will also be run off at the same meeting. Entries close on September 17th. The address of Mr. J. S. Fulton, the secretary of the Scottish A.C.U., is 131, West Regent Street, Glasgow.

The Popular Sidecar.

With the arrival of September, the touring season for motor cyclists is drawing to a close. Unquestionably 1919 has been a record year in many ways. Never have so many sidecar machines been seen on our roads—this must surprise the critics, who many times in recent years threatened its demise with the arrival of the cycle car. But the sidecar has not only survived, as we of *The Motor Cycle* always said it would, it has seen the premature boom in cycle cars fizzle out, and is now ready for a second onslaught from the much-improved post-war designs of small cars, many of them with light air-cooled engines based upon aero engine developments.

SCOOTER NOTES.

Racing Scooters.

A well-known works director told us last week that his firm had built a scooter especially for a hill-climb. When taken on the road only one expert tester could ride the machine. It was not entered for the event intended as it was too fast—fact!

Enter the Scooter.

At last scooters are being turned out of the different factories devoted to these new-old velocipedes. Several agents have received machines for demonstration purposes. It will be some weeks yet before they appear in quantities.

Will a Scooter Skid?

We have several times been asked this question, but cannot answer it definitely, since our riding experience with four different types of scooters has been confined to dry or comparatively dry roads. It is asserted (with what authority we cannot say) that due to the quick steering a scooter will most assuredly skid.

Why Stand?

Two of the "stand-up" scooter merchants have decided to offer a seat "as an alternative," in deference to the wishes of clients. The original A.B.C., it will be recalled, had no seat, and when it acquired one its popularity went up 75%. Notwithstanding, two scooter designers in particular champion the saddle-less machine, contending that a machine with a seat must have an extended wheel-base, besides which the saddle interferes with starting and mounting.

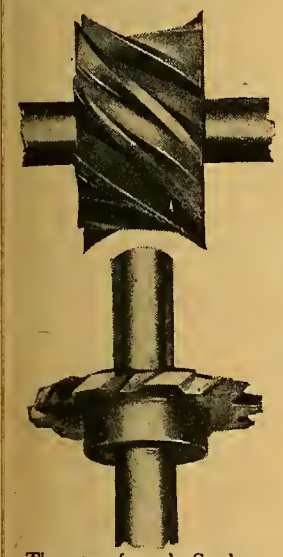
"Stand-up" Travellers.

A man who recently covered a long distance trip standing up on a scooter was asked at the finish if he intended to back up his policy by standing up in the railway carriage all the way home!

AN INTERNAL COMBUSTION TURBINE.

An Experimental Engine possessing Several Unique Features.

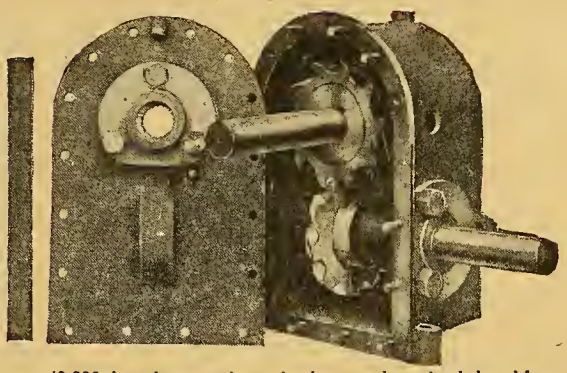
OWING to the constancy of their torque and absence of vibration, turbine engines will always appeal strongly to motor cyclists, and, among turbines, the engine invented by Captain J. M. Sanders, Woodside House, Canford Park, Westbury-on-Trym, is a very notable example. For a detailed description of this ingenious engine, we must refer our readers to *The Autocar* of August 30th. This will very well repay their study. Briefly, the engine consists of two elements of skew gear, one of which is termed the "cylinder," being made after the pattern of the Lanchester worm with a hollowed surface, the second or "piston" wheel being so narrow that its grooves appear more like the teeth of a chain sprocket than part of a worm gear. As the teeth of the piston wheel pass along the grooves of the cylinder wheel, compressed fuel enters behind them, and this is fired as the tooth advances. There will then be as many slight impulses per revolution as there are grooves in the cylinder wheel—in this case ten. The "piston" wheel revolves idly, but it will be readily understood that one wheel cannot revolve without the other. The plug which gives the mixture emits a constant stream of sparks.



The rotors from the Sanders turbine.

Not Yet Complete.

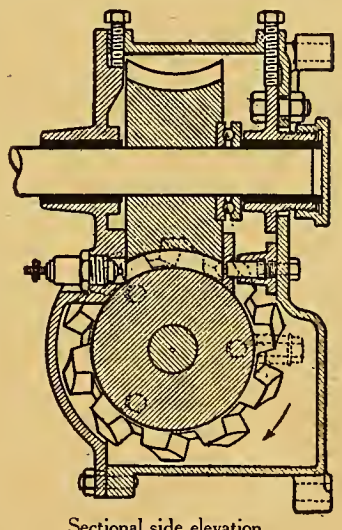
It will be noticed that combustion and exhaust only are provided for in the turbine, but, as the four-cycle principle is employed, the induction and compression are arranged outside the apparatus, a reciprocating compressor performing the other functions of the cycle, induction, and compression. Later, however, a third wheel may be included in the train in order to provide for the complete carrying out of the phases of the Otto or four-stroke cycle within the turbine itself.



40,000 impulses a minute is the speed attained by this experimental model of the Sanders turbine. Its size is indicated by the 12in. rule at the side.

Under test, the experimental engine ran on compressed air at a speed of 1,000 r.p.m., but, when the air was passed through a carburetter, mixed with petrol gas, and fired, the revs. immediately jumped up to 4,000, which means 40,000 impulses per minute.

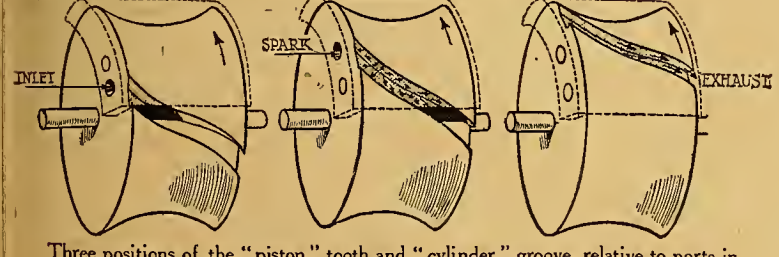
Cooling was effected by a blast of cold air directed from a small blower, but water-cooling could easily be applied; lubrication was supplied from oil cups on the journal bushings.



Sectional side elevation.

It is estimated that the fuel efficiency will be comparable with that of the standard type of internal combustion engine.

The engine is as yet only in its experimental stage, and may take a couple of years to develop, but Prof. W. Morgan, of Bristol University, states that it is constructed upon correct mechanical principles and involves no fallacy. It is expected that the weight per h.p. will be exceptionally low, since it is calculated that an experimental model which, having a 5½in. cylinder wheel and two piston wheels, should give 36 h.p. at a speed of 10,000 r.p.m.



Three positions of the "piston" tooth and "cylinder" groove, relative to ports in the shroud at the moment of gas admission, firing, and exhaust.

In view of the fact that many agents are alleged to be adding from £100 to £200 to the price of new cars, despite the fact that they are under agreement to sell at list price, the Motor Trade Association is taking action. Agents against whom the charge of demanding excessive premiums is proved will be placed on the "stop-list," which means that all reputable sources of supply, both of cars and accessories, will be closed to them.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

"CICETER."

Sir,—Permit me to question your contributor's statement that the correct pronunciation of Cirencester is only used by "the very old-fashioned country folk, and by Lord Bathurst and his country circle." What would Mr. Harper make of the following?

There was an old lady of Cirencester
Who went to consult her solicitor.
When he asked for his fee
She said, Fiddle-de-dee!
I only looked in as a visitor.

P. GARDNER-SMITH.

A STOLEN MACHINE.

Sir,—On August 16th, 1919, a new 1919 Triumph 4 h.p. motor cycle, index number BW 2930, engine number 19613, also a suit of overalls and a few accessories, were stolen from a garage in this city by Raphel Finella, alias Harry Ray, an Italian, ex-soldier, music hall artist, and hairdresser. Age 24, height 5ft. 5in., home address, 5, Little Saffron Hill, London, E.C.

Information is to hand that he has sold the stolen motor cycle for £80 somewhere, and was seen in Kingston-on-Thames, riding a 1914 Calthorpe-Jap motor cycle, number unknown, for which he produced a receipt showing he had purchased same for £40 at the end of August.

This may attract the attention of the people who bought or sold the above-mentioned motor cycles; if so, I shall be pleased to hear from them.

Oxford. OSWALD COLE, Chief Constable.

SPARE PARTS.

Sir,—Our business has necessitated the daily use of a Big Four Norton, and right well has it responded to the call. Naturally, constant work demanded spares, and in one instance an overhaul. It was with trepidation that we approached the makers, having in mind a particular friend who had been held up some considerable time by his inability to get spares. Judge then to our joy when we received a letter from the Norton Motors, Ltd., stating that they had sent on spares as requested, and at the same time advising us how to fit them.

We feel sure that such treatment deserves every publicity. J. W. STAINSBY AND CO.

Sir,—I have a 2¾ h.p. Omega-Jap, and the other day was unfortunate enough to break my chain. I wrote to Messrs. W. J. Green, Ltd., Coventry, about it, stating that the motor cycle was only two months old, and that the chain was obviously defective, and was agreeably surprised to receive almost immediately a new chain free of charge, and this though the broken part was not of their manufacture.

In the matter of spares the firm is equally obliging, and I have been able to obtain necessary parts per return without the inconvenience of *pro forma* invoices and long waits, which have been my experience elsewhere.

The usual disclaimer. A.C.P.

Northampton.

Sir,—I have a 1914 model of a well-known make, and have just applied for some new parts, including a rear brake block.

In reply to my letter, the makers regret they are unable to replace these parts, and return me my money. The result is I cannot use my bicycle at present, as I am unable to obtain the parts elsewhere.

At the same time they are turning out these very parts in hundreds, as shown by the large number of their 1919 models seen on the road.

Their anxiety to be first in the post-war rush one can readily understand, but surely their old clients should be given a little consideration? A. BEVAN.

ENGINE DESIGN.

Sir,—"Engineer's" letter in your August 28th issue, offering information respecting the advantages of outside flywheels, can hardly be allowed to pass unchallenged.

The presence of more than an insignificant quantity of oil in the crank case in entirely due to the absence of, or apology for, a lubricating system. There is also no reason for the flywheel clearance to be so small. The adoption of the outside flywheel does not remove the cause, but adds disadvantages (set out in my previous letter) in other directions.

"Engineer's" claim of both flexibility and ease of acceleration for the outside flywheel is absurd. These qualities, so far as affected by flywheels, are in direct opposition to each other, and no type of flywheel can effect improvement in both directions.

Again, "Engineer" claims the advantages of ball and roller bearings for the outside flywheel engine. I fail to see why such engines should derive greater benefit from their use than any other type of engine. Or is your correspondent under the impression that the use of these bearings is confined to this type? I am sure that if "Engineer" and any other readers interested give the question a further few minutes' study they will comprehend these simple facts.

Birmingham. TWO-STROKE.

An English machine in Denmark. Mr. Host, riding for Otto Drewsen, Danish agent for Invicta machines, recently completed 752 kilometres in 22½ hours, on a 2½ h.p. Invicta, fixed gear two-stroke.

ROLLER BEARINGS.

Sir,—Referring to the roller bearing described in *The Motor Cycle* of August 21st, I should like to point out that there is nothing novel in this, as the design was submitted by me to the Air Board in the early stages of the war, the objection to the design being the difficulty in hardening the crankshaft of the length required in modern aero engines.

C. BINKS.

BENZOLE.

Sir,— Having read an article on benzole in your issue of August 21st, I note that you advocate a test for benzole to ascertain its liability to freeze in the tank or carburetter. Why not carry out these tests in the laboratory? I would like to point out that if the National Benzole Association would include 3% of toluene in its specification no frost common to England would be severe enough to freeze it. A few experiments carefully carried out would enable a chart to be made giving the lowest percentage of toluene required to meet any degree of frost, the toluene making no difference to the working of the engine.

TESTER.

Risca, Mon.

A CHEAP MAGNETO.

Sir,—Having followed for some months the trend and design of the latest ideas in motor scooters and lightweight cycles, as described in your paper, I note the difficulty of the various enterprising firms in getting a cheap magneto for ignition, and therefore having to fit the rather clumsy Bosch type, though now made a little smaller.

I am prepared to design or supply the driveless pattern which is wrongly called flywheel magneto, and shall be pleased if you can draw attention to my statement. If a scooter or any other cheap motor bicycle is proposed for quantity production it will be just as well to get a standard design for this particular vehicle. It will make a nicer arrangement, be cleaner, and embody features which the motor cycle manufacturers like themselves, and not the magneto people only, viz., price.

FRED J. HOFFMAN.

COASTING WITH EXHAUST VALVE RAISED.

Sir,—*Re* Mr. Taylor's letter of June 12th and "Douglas's" reply, June 26th, the mixture is certainly not firing, and, consequently, there is no blue flame burning the exhaust valve. The effect of running with the exhaust valve lifted and with throttle and air open is, it appears to me, as follows: On the down (suction) stroke the piston exercises only a certain amount of suction, and as the exhaust valve is open as well as the inlet valve a large amount of warm (if not hot) air is drawn from the exhaust, and a small amount of mixture through the inlet valve. Nearly the whole of this very weak mixture is swept out through the exhaust on the upward (compression) stroke, with the result that, not only is there no compression, but, if the ignition is well retarded, the spark would occur when the piston was actually tending to create a partial vacuum, and air was being drawn in through the exhaust; consequently, it is a matter of impossibility for there to be any explosion in the cylinder. On the down (firing) and up (exhaust) strokes air is pumped in and out the cylinder through the open exhaust valve. The series of loud bangs to which "Douglas" refers are due, I think, to the fact that the air and mixture being pumped in and out through the exhaust valve does not have time to escape to the outer air, and, as on each suction stroke a small amount of gas is being drawn in, and then pumped into the silencer, the mixture there eventually grows rich enough to be fired by the heat of the silencer or exhaust pipe.

In my opinion, the reason why the throttle and air should be open, the former only slightly, but the latter fully, is that the mixture drawn in through the inlet valve is quite cool, whereas the air pumped in and out through the exhaust valve is hot. Not only that, but with both exhaust valves lifted and air and throttle open, freer running is obtained, and, unless the hill is very steep, it is not always desirable to check the speed to any considerable extent.

One word of warning before releasing the exhaust valve lifter at the bottom of the hill: it is advisable to close the throttle first for a moment, drop the valve lifter, and then reopen the throttle gradually to the required extent. This prevents the engine firing suddenly, with the consequential strain upon the working parts and transmission.

Hornsey, N. MACCABÆUS.

A MOTOR CYCLE CLUB FOR THE ROYAL NAVY.

Sir,—I write to endorse the letters of Lieut. Evans-Greaves and Signalman Fellowes.

Throughout the war I kept at least four separate motor cycles at Rosyth, and had a great many friends who did the same. At present, on board this ship, there are two cars, four motor cycles, fully twenty "push-bikes," and, of course, literally dozens more are kept ashore. I venture to suggest that the club, if ever it matures, makes some arrangement for the transfer of machines from port to port when it is impossible to have them on board.

Atlantic Fleet. MIDSHIPMAN.

COURTESY OF THE ROAD.

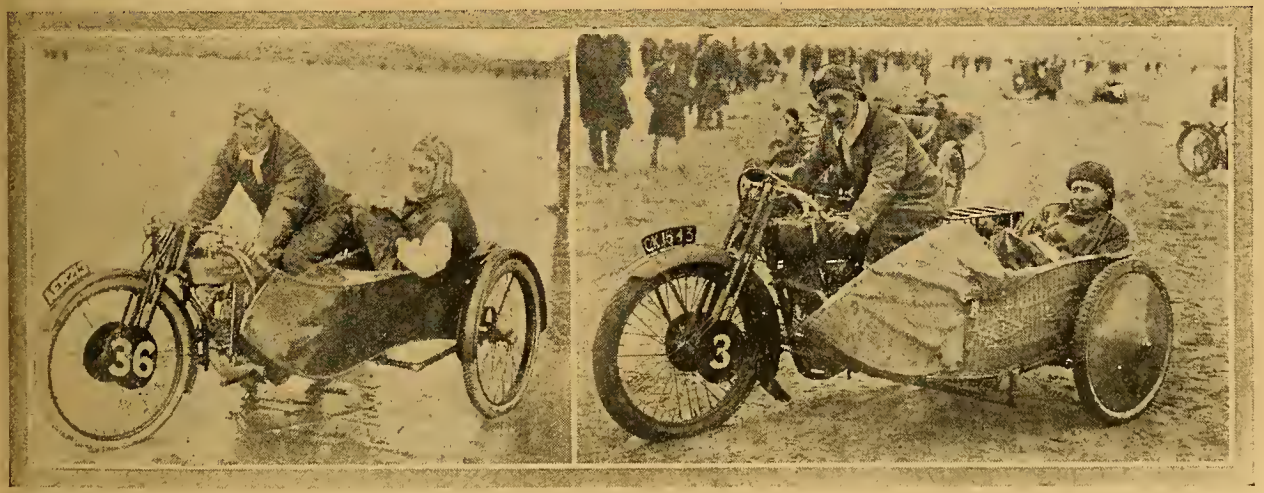
Sir,—Whilst proceeding from Redhill to Haslemere on Friday, August 1st, I was unfortunate enough to "come a cropper," resulting in a badly buckled wheel.

On considering the matter, I decided to leave the machine in a garage at Dorking and proceed to Haslemere by train, but, on examining my purse, I found I had left my money at home, and all I could muster up was 1s. 7d. in odd cash.

Whilst I was wondering how to manage another motor cyclist came by on a Douglas, and, after having a look at my "wreck," asked me what he could do to assist me, and when the position was explained, he promptly loaned me sufficient money to get home. This is the most gentlemanly and sportsmanlike case that I have met with during my motor cycling career.

BK 296.

Haslemere.



S. L. Bailey (Douglas, on left) and B. Houlding (Harley-Davidson), both winners in their respective sidecar classes at the Weston-super-Mare Speed Trials, a full description of which appeared last week.

CONCESSIONS TO DESPATCH RIDERS.

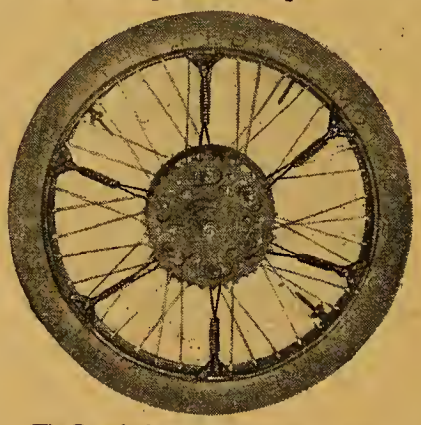
Sir,—"Discharged Highlander" ought to know by this time that the only way to get concessions out of the Government is either by "wanghng" or agitating. If somebody full of energy had started throwing Mills bombs at the Government Department concerned in the shape of urgent appeals on behalf of the infantryman he would no doubt have obtained the same concession in regard to motor cycles as the despatch rider. But this so-called concession for despatch riders seems to be all moonshine so far as I can make out. My application for a countershaft Triumph went in immediately through the A.C.U. to the War Motors Association, but the furthest I have got yet is the intimation that there are thousands of names on the list, and that the only machines being released are 2¾ h.p. Douglases and a few sidecar outfits, and very occasionally a hub gear Triumph, the later priced at sixty guineas apiece.

Is the War Motors Association a dividend-earning concern, or something in miniature after the style of the R.A.A.? Who fixes the prices of the machines, and has any ex-D.R. yet obtained a machine at a price which really made it a concession? EX-D.R.

A SPRING TRANSMISSION.

Sir,—I am forwarding a photograph of a spring transmission which I have fitted to my 8 h.p. Chater-Lea. Previously the machine had no cushioning device, and, although fitted with a good clutch, was very uncomfortable when running at a low speed on the top gear (3⅞ to 1). The jerk on the transmission was the cause of several spokes breaking in the back wheel. (The machine is a 1913, by the way.)

The good points of my idea (which I have protected) are a good range of movement of the gear wheel (this may be as much as to absorb one revolution of the engine) and the drive taken directly to the rim of the road wheel by the springs instead of through the spokes. The gear wheel is bushed and mounted so that it can oscillate on the hub, and, the connections to the rim being brought to a tangent, the springs are compressed by being pulled from opposite ends. The idea of having the springs in compression is that in case the springs break the drive would still take place.



The Beresford spring transmission device.

I have recently tested the transmission by taking four adults (thirty-nine stone) on top gear from Hathersage up the hill to the Surprise (Derbyshire), and more recently my wife and I rode the hilliest parts of North Wales on the machine, and I find I can run at very low speeds on the high gear without feeling in the slightest the impulses of the engine.

For single-cylinders, I would mount a ratchet wheel or ring on the gear wheel, with the pawl mounted on the chain stays of the frame. This would retain the gear wheel after each impulse of the engine until the springs had reassumed their normal position, thus making the drive continuous. For big singles, I am of the opinion this would be a great improvement.

I may point out that the photograph shows my device in the experimental stage only. When placed on the market it will probably have the springs enclosed. This would make for ease in cleaning, at the same time improving the appearance. W. H. BERESFORD.

FITTING A CHANGE-SPEED GEAR.

Sir,—For some time I have been looking for a change speed gear suitable for fitting to an ancient 4 h.p. Antoine in my possession. After many enquiries, I decided on the Mabon variable gear as the likeliest proposition. The results have entirely justified the expense, for I can now take a heavily loaded sidecar up hills which I used to have some difficulty in getting up solo.

Mine was an awkward machine to fit, as it had only one top tube, and, for the sake of appearances, I had to interpose the attachments for the guide bar of the gear between the tank and the top tube of the cycle frame. I also had to fit a new footrest. A new 1in. belt was fitted, which gave a little trouble at first, as all new belts do.

The gear keeps the belt in tension in all positions, and is a thoroughly workmanlike attachment. The only criticism I can make is that the ball bearing track on which the belt runs in the free engine position is not quite wide enough for a 1in. belt, but seems to have been intended for a ⅞in. belt. However, as my old pulley was a ⅞in., it is possible a small mistake was made in fitting. Anyway, the trouble soon rectifies itself with a little wear.

I can honestly recommend anyone wishing to turn a fixed gear machine into a variable to try the Mabon. I have no interest in the firm whatever save that of a satisfied customer. WILFRED M. BEAR.

THE VALUE OF THE AUTOMOBILE ASSOCIATIONS.

Sir,—There have been several letters of criticism in your columns re the R.A.C. and the A.C.U. which, I think, are unwarranted, as the following experiences will show:

I started a fortnight ago on a journey from Rotherham to Morecambe, and, unfortunately, punctured just outside Doncaster. I was stooping down to examine the wheel when a cheery voice exclaimed, "Let me give you a hand," and I was delighted to find that an R.A.C. scout had ridden up to my assistance.

I continued my journey, and when about twenty miles from my destination a motor cyclist collided with me, ripping eight spokes and the valve out of my sidecar wheel. I was unable to repair the damage, and, as all communication from the village by telephone or telegraph was cut off till the following morning, I could not request assistance under the terms of the "Get you home" scheme. Fortunately for me, a motor car drove up on the way to Bradford, and I persuaded the chauffeur to take my wife and myself to Morecambe on his own terms. I wrote the R.A.C. and explained the circumstances, at the same time requesting them to meet me in the expense. The Club very promptly forwarded a cheque for the full amount, which I consider very good of it, as my case was rather outside the conditions set forth on the "Get you home" voucher. CHARLES BROWN.

SUMMARY OF CORRESPONDENCE.

A reader, signing himself F. Crow, has applied to the Automobile Association for particulars of membership, using a picture postcard published by the Douglas Co., and illustrating Major C. A. de Montigny, of the Belgian Army, on a Douglas motor cycle. Mr. Crow omitted to mention his address, so that the Secretary of the A.A. is unable to communicate with him. Similar requests have been received from readers of *The Motor Cycle* named Harold G. Hanley, J. P. Whelan, H. A. Gilmour, and Major C. Micklen, who should accept this intimation that their communications bore no address.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with "*The Motor Cycle*."

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle, its care and management. Twentieth Edition. 286 pages. 400 illustrations.	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Sixth Edition. (Second Reprint).	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	4/6	4/10

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

A selection of questions of general interest received from readers and our replies thereto. All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects

Normal R.P.M.

I have a twin-cylinder w.c. 80×80 mm. Fafnir engine of the year 1908, which I intend to use for stationary work. It has enclosed flywheels, and develops, I think, about 6 h.p., and as I am on the point of ordering pulleys for the work I intend it to do, I should like to know at what speed it develops its maximum power. I suppose the makers would be the best people to apply to, but they do not advertise in your paper, and so I am unable to get in touch with them or their agents.—W.S.H.

The Fafnir engine is a German production, hence your inability to get in touch with the makers. It probably develops its maximum power at about 1,800 r.p.m., but will no doubt be capable of reaching 2,000 r.p.m. or more, but without increase of power.

Consumption of Two-strokes.

(1.) I have a Sparkbrook two-stroke motor cycle and the gear worries me, as every time I change from top to bottom there is a jerk, as though there were a few teeth missing. When I want to change gear I slow the engine, lift the decompressor, then change, and sometimes only there is a stop, then start again. If I wheel the machine on low speed, lifting the decompressor at the same time, the engine suddenly stops for a fraction of a second and then goes on again. Could you explain why? (The gear lever is properly adjusted.) (2.) Is the consumption good if I travel from South Kensington to Eastbourne with not quite a tankful? I used to use petrol, but the last time I had benzole, and found that I consumed less than petrol. Is 23 m.p.h. a good average for a two-stroke? I only use the second gear in traffic. (3.) Is Castrol oil all right for two-strokes? About one drop every three minutes?—H.M.

(1.) We should advise you to examine the gear box and operating mechanism, as there is apparently something amiss with this part, and to continue running might result in serious damage. (2.) The petrol consumption is apparently about 60 m.p.g. This is not uncommon with 2¾ h.p. two-stroke engines. As compared with four-stroke engines they are certainly more extravagant. (3.) Castrol oil is quite satisfactory for your type of engine. If your machine is fitted with a drip-feed lubricator and oil pump combined, adjust the drip so that the pump discharges about every eight miles.

Spark Advance and Knocking.

When my machine has been running some time, as soon as I come to an incline, the engine commences to knock and lose power, which, I understand, is due to pre-ignition caused by excessive heat. If, however, this *is* due to the excessive heat in the cylinder, how is it that when the spark is retarded a little the engine immediately picks up speed and ceases to knock; the excessive heat is still present, is it not? therefore, why should retarding the spark alter the explosion at all? I had experience of this recently on the last ten miles of a 150 mile run, but no matter what sort of a hill I came across in the last few miles, the knock stopped immediately the spark was retarded, and the machine picked up splendidly in top gear. Now, if an engine is knocking and losing power through pre-ignition due to the gases being exploded by excessive heat instead of by a spark, why should alteration of the spark affect it to such a degree?—F.E.

Under the circumstances you describe, the pre-ignition is not caused by excessive heat, but by the fact that the speed in falling off sets up a condition having the same effect as when the spark timing is unduly advanced. Retarding the spark consequently corrects this, and the knocking ceases. The gases are not exploded by the excessive heat of the engine, as you could easily prove by cutting out the ignition if a magneto switch is fitted. Your engine is apparently timed too early.

Elusive Ignition Fault.

I shall be obliged if you will advise me concerning my 5-6 h.p. twin. The complaint is that the back cylinder will not fire under compression; disconnect the front cylinder cable and the back runs well, but as soon as the cable is placed on the front plug the spark at the back becomes too weak to ignite the charge. I have just had the magneto back for the second time from the makers of the engine, and they have not been able to correct the fault.—S.W.R.

As your magneto has been to the makers of the machine twice, we can scarcely assist you in eliminating the fault. The only thing we can suggest is that you try a new plug in the back cylinder. We presume that you have the correct terminals connected up, that is, the front terminal on the magneto to the plug of the rear cylinder, and the back terminal to the front plug. If these points are in order and you still get faulty running, we would suggest that you return the magneto to the makers, if it is an English one, or send it to one of the firms specialising in magneto repairs.

A close finish at the Ilkley M.C. and L.C.C. hill-climb. Tim Wood (3¾ Scott) is just beaten by F. Marshall (3½ Sunbeam). The results of this event were given in last week's issue.

A Question of Date.

Recently I purchased a 3½ h.p. Calthorpe motor cycle which was sold to me as a 1913 machine, but on taking down the engine for overhaul I found that the year 1911 was stamped on the crank case. Having paid for the machine and received a receipt for the money, have I any legal right to claim a portion of the amount paid as being the difference in value between a 1911 and a 1913 machine?—J.A.R.

You can certainly make a claim on the facts as stated by you, or send back the machine and demand the return of your money.

A Miniature Engine.

(1.) I have a 1914 lightweight fitted with single-cylinder engine, four stroke, 200 c.c., and cannot get the engine to respond to the throttle. If it is opened above one-third of the way, the engine stops firing, and the maximum speed does not exceed 20 m.p.h. I have fitted both a No. 30 and 28 jet to the B. and B. carburetter, but the trouble remains the same. The engine is in fair condition, and no difficulty is found in starting, although, in changing from low gear to high, the engine labours, and, if on the slightest up gradient, stops altogether. (2.) New piston rings have been fitted, and the compression is good, yet the crank case becomes too hot to bear one's hand upon. I should be glad if you could give me some possible causes of these troubles.—H.E.F.

(1.) These extremely small four-stroke engines are usually very sensitive to minor adjustments, and are not suitable for sustained high speed work, as they quickly lose their tune. From your description, the adjustments appear to be all in order, and, therefore, the cause of the trouble is somewhat doubtful. Possibly the sparking plug is not suited to the engine, and an improvement might be found if one were fitted having stouter electrodes. In changing from low gear to high, it is absolutely necessary with an engine of this size that you attain a fairly high road speed before actually making the change; this practically prevents you making any changes into high gear unless you have reached the top of a hill. (2.) The heating of the crank case is probably due to conduction only.

Tuning for Speed.

I am desirous of tuning up a 3½ h.p. single-cylinder engine for speed (to be used only in competition). I have already won numerous hill-climbs and ridden in the T.T., and am now trying to build a really fast engine. I shall be very pleased if you will tell me: (1.) The best compression ratio. (2.) The best compromise balance. (3.) The most efficient magneto advance in degrees. (4.) Valve timing.—R.C.

(1.) It is very difficult to advise on the best compression ratio, as everything depends on the design of the engine. Normally, the compression ratio of motor cycle engines is from 4 to 4½ to 1. If you are desirous of knowing the most suitable bore and stroke ratio, this again depends upon the personal inclination of the designer, as almost all types of engines have been equally successful in racing. (2.) The usual arrangement for the balancing of single-cylinder engines is to take the weight of the crank pin and big end of the connecting rod together with half the weight of the piston, gudgeon pin and little end, and balance this as a rotating mass. (3.) Thirty degrees is about the maximum advance of the magneto timing. (4.) Inlet opens top dead centre. Inlet closes 20° past bottom dead centre. Exhaust opens 40° before bottom dead centre. Exhaust closes 5° after top dead centre. Above is a normal timing, and the whole subject of timing for speed is open to discussion. You will require to experiment with such things as early and late opening of inlet valve, overlap, and strength of valve springs to obtain the maximum results from whatever type of engine you adopt.

Failure to Start.

As I am a novice I should be greatly obliged if you will answer the following: my 3½ h.p. Rudge starts well on the stand, but when I take it on the road I have to run a great distance before it fires. I have cleaned the sparking plug, but the result is the same.—T.J.P.

As the engine runs well on the stand, there is apparently very little wrong with it, and whatever prevents it running on the road can merely be a matter of small adjustment. Possibly an alteration of the level in the carburetter takes place when the machine is lowered off the stand on to the ground, or may be the belt is so slack that it will not turn the engine over compression when you run alongside in order to start.

An Unsatisfactory Purchase.

A few days ago, in answer to an advertisement which read: "Rex 3½ h.p. motor cycle, cheap, for quick sale, sound condition throughout." I called at the address mentioned. At the time I had rather a bad shoulder, and was unable to try the machine personally, so got the owner to give it a short run, and as it seemed satisfactory I purchased it. The owner told me that it was in good order throughout. I may mention that it was evening and the place rather dark. The following day I found that the engine cradle was broken in three places, and had been patched up. I therefore took the machine back and showed it to the vendor. He said that he had bought it off a man as being in good condition, and refused to return my purchase money, although I pointed out that I bought it on his representation that it was sound. I should like to know if (1) I can legally claim my purchase money back in full, or (2) in the event of my having the machine repaired, can I claim the cost from him?—J.A.

From your statement of the case, we think you will have very great difficulty in proving misrepresentation, unless you have witnesses who were present at the time of the sale. (1.) If proof is possible, however, you can legally claim the refund of your money. (2.) Or you might justly claim the cost of a satisfactory repair, if you desire to keep the machine.

Magneto Failing.

I have a Bosch magneto, and when I turn the sprocket by hand with a fairly sharp pull I get an excellent spark through the plug, but when the sprocket is coupled up to the chain and running fairly steadily there is no spark whatever. Do you think the magnets want remagnetising?—W.H.

There is no reason why the magneto should not spark. Why you do not get a spark is probably because when you give the magneto a sharp pull over this is equivalent to about 1,000 r.p.m. of engine, and when the magneto is rotated by the kick starter the speed is so low that either no spark or a very small spark is obtained. We hardly think that the magnets require remagnetising.

READER'S REPLY.

Valve Overlap.

If the correspondent who is having trouble with his 1912 5-6 h.p. Rex, through blowback, due to overlapping of valves, cares to put up with more noisy tappets, he may get over the difficulty of overlap by leaving the tappet adjustment rather wide, thus allowing the exhaust to close sooner and the inlet to open later. However, he should first examine the heels of each tappet lever arm, to see if any wear has caused a lip or ridge on either which would set up a drag on the valve action. It is not generally known that the timing of either valves or ignition can be minutely varied by adjustment, but I have had many engines through my hands where particular attention has had to be paid to these apparently unimportant details.—JOHN E. REDHEAD.

RECOMMENDED ROUTES.

CHELMSFORD TO WATFORD.—S.P.S.

Chelmsford, Bedells End, Leaden Roding, Sawbridgeworth, Eastwick, Stanstead, Hertford, Hatfield, St. Albans, Watford. Approximately 54 miles.

YEOVIL TO BRAINTREE.—M.N.C.

Yeovil, Wincanton, Hindon, Salisbury, Andover, Whitchurch, Basingstoke, Reading, Maidenhead, Beaconsfield, Watford, St. Albans, Hatfield, Hertford, Bishops Stortford, Gt. Dunmow, Braintree.

ST. LEONARDS TO YORK.—J.H.

St. Leonards, Battle, Robertsbridge, Lamberhurst, Tonbridge, Ightham, Wrotham, Meopham, Gravesend, by ferry to Tilbury, East Horndon, Brentwood, Chipping Ongar, Bishop Stortford, Little Hadham, Braughing, Buntingford, Baldock, Biggleswade, Eaton Socon, Stilton, Stamford, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, Ferrybridge, Sherburn, Tadcaster, York.

ASHINGTON (NORTHUMBERLAND) TO WOLVERHAMPTON.—J.E.T.

Ashington, Morpeth, Newcastle, Chester-le-Street, Neville's Cross, Darlington, Northallerton, Boroughbridge, Wetherby, Aberford, Ferrybridge, Doncaster, Worksop, Mansfield, Nottingham, Long Eaton, Ashby-de-la-Zouch, Tamworth, Weeford, Muckley Corner, Brownhills, Gailey, Wolverhampton.

MOTOR CYCLES FOR SALE.

A.J.S.

NEW Military 6h.p. A.J.S., not ridden, fitted Sunbeam sidecar to match; best offer over £150.—een only at 29, St. Leonard's St., Bromley-by-Bow Exchanges. [4573

A.J.S. 1916 2¾h.p., 2-speed, hand clutch, kick starter, enclosed chain drive, in first-class condition, new ick tyre, lamp set, and horn; £67.—G. Savage, 7, High t., Sutton, Surrey. [3980

A.J.S. 2¾h.p., 1914, 2-speed, countershaft, hand clutch, in good running order, complete new mp set and horn; £45.—The Bungalow, Sutton, ear Hull, E. Yorks. [X2101

A.J.S., 1914, 2¾h.p., all-enclosed chain drive, kick start, footboards, special mudshields, excellent res, splendid mount for elderly gentleman; £50.—23, ardwicke Rd., Reigate. [3870

1919 A.J.S. Combination, not done 500 miles, lamps, horn, screen, spare wheel, etc., like new in every spect; any trial or examination; £200.—Marriott, 28, ladstone Rd., Scarborough. [X1663

h.p. A.J.S. Combination, 4 detachable wheels, wind screen, apron, speedometer, all lamps, horn, etc., rst-class mechanical condition, tyres good; after 6; est offers. Legge, 105, Abbotts Rd., Southall. [4179

1918 A.J.S. Combination, 6h.p., interchangeable wheels, tyres 700×80, spare wheel with new xtra heavy Dunlop tyre, perfect order and splendid ndition; Yorks district; £150.—Box L4,043, c/o *he Motor Cycle.* [4602

A.J.S. 3-speed 6h.p. Twin Combination, lamps, horn, speedometer, etc., just overhauled, new ains, new case, and back tyre, perfect running ndition, ride away anywhere; best offer secures.—59, Earl's Court Rd., London. [X2041

1914 A.J.S. 6h.p. Combination, 3 speeds, K.S., in excellent condition, just overhauled, enamelled, ated, and coach painted, new Dunlops, Lucas lamps, umerous spares, complete; 110 gns.—Bramall, Creswell ottage, Gt. Bridgeford, near Stafford. [X2005

A.J.S. 6h.p. Combination, 1914, 3-speed, screen, hood, horn, 3 lamps, new spare tyre, spares, and tools, ored from October (1914) till May (1919), excellent ndition; best offer over £105; seen by appointment dy.—Suggit, 14, Gloucester Rd., Regent's Park, N.W.1. [3842

A.J.S. 6h.p. Combination, 1916, luggage grid, 4 interchangeable wheels, Lucas horn, Stewart eedometer, accumulator lighting throughout, numerus spares, unused during restrictions, excellent conition; nearest to 145 gns. accepted.—263, Rawlinson ., Barrow-in-Furness. [X2057

A.J.S., 6h.p., late 1915, 3-speed, interchangeable wheels, with Gloria cane sidecar, all tyres new. ersize Dunlop grooved on back, spring seat pillar, new are chain, Lucas lamps, engine bearings perfect, excellent condition and running order; trial here; best ffer over £120.—James, Richmond, Llandyssul. [X2033

GENUINE Offer.—A.J.S. 4h.p. twin sporting combination, late 1916, disc wheels, T.T. bars, 1917 ills-Fulford sidecar, spare wheels, mechanical and ulb horn, Lucas lamps, stored 18 months, overhauled nd painted April this year; any trial; photo 6d., ower buying car; £115.—Ashworth, Pwllheli, Wales. [X2256

Alecto

ALECTO, Alecto, 3½h.p., 2-stroke, countershaft gear, hand-controlled clutch, chain-cum-belt, large tyres, ast, powerful, and reliable; price £83/7; quick delivery. f you are interested, call and see us.—Vivian Hardie nd Lane, Ltd. (sole agents for London north of the hames, and Middlesex), 24, Woodstock St. (off Oxford t.), Bond St., London, W.1. 'Phone: Mayfair 6559. [0036

Alldays

ALLON.—Caffyns, Ltd., Eastbourne, for delivery shortly. [0017

ALLON 2-stroke Single Speed Motor Cycle, in excellent condition; £45.—Strange, Printer, Eastbourne. [3775

ALLDAYS Allon, 1916, 2-stroke, 2-speed, speedometer, horn, lamps; £55; after 6.—80, Vicarage d., Watford. [4345

ALLON, 1919, 2¾h.p., special model, accessories, complete; 60 gns.—Fairhaven, Wavertree Rd., outh Woodford. [4434

3h.p. Alldays Allon, 1917, 2-stroke, 2 speeds, free 4 engine, perfect condition; £62.—E.G., Belle Vue, rincieth, N. Wales. [3898

JONES' Garage, special agents for Alldays Allon, Broadway, Muswell Hill, N.10, and Woodside arade North Finchley. [2931

ALLDAYS Matchless, 1914, 3½h.p., 2-speed, Binks 3-jet, Bosch, good condition; £38; after 6 p.m.—29, Loveday Rd., West Ealing. [4118

1915 Allon 2-speed, clutch, lamps, horn, new tyres, belt, and chain, good condition, climbed Great rme; £48.—Bromhead, Laurel Bank, Rainhill, Lancs. [X2200

1917 Alldays Allon, 2-speed, 2-stroke, 2¾h.p., lamps, perfect condition, Cowey speedometer; £55.—rite appointment, Healey, Danetree House, Kilsby, ugby. [X2324

ALLDAYS 2-stroke, 3-speed, lamps, horn, speedometer, small mileage, perfect condition; first 50 secures.—Hemmings, Jersey House, Hewlett Rd., heltenham. [4273

Promises

I would much rather break the prison of a wall or of the laws, than the bond of my word.

Performance

Montaigne, Essays III., 9.

You are the first agents I have come across who let me have the latest date of delivery that is probable, and let me have the machine sooner than expected. I shall in future always deal with you.

From a Customer, Sept. 3rd., 1919.

WE were all Optimists in the early part of the year and were all more or less fed on promises—but we think Godfrey's Advertisements will prove that we were one of the first to refuse to give definite dates of deliveries, and discourage the sending of deposits.

GODFREY'S have also been consistent all through in their policy of returning the deposit of any customer who for any reason wish to cancel his order.

IT occasionally happens that we are in a position to supply a new machine from stock or within a few weeks from date of order, but in any event a customer can rest assured that a promise given by Godfrey's can be relied upon.

GODFREY'S

LIMITED,

208, Gt. Portland St., LONDON, W.1.

Telephone: Mayfair 7091 (2 lines).
Grams: "Gofrabike, Wesdo, London."

MOTOR CYCLES FOR SALE.

Alldays.

ALLDAYS Matchless 1914 4h.p. Combination, 2-speed, free engine, handle start, Bosch mag., Senspray carburetter, lamps, perfect condition; £65.—113, Alma Rd., Ponders End. [4395

ALLDAYS Matchless, 1915, 2¼h.p., 2-stroke, just overhauled and repainted blue and black, new tyres, horn and lamp; price £35, or nearest offer.—Capt. Edgar, R.A.F., Grain, Kent. [3939

Antoine.

3½h.p. Antoine, low, sporty, fine condition, Triumph free engine back wheel; £30.—67, Wantage Rd., Reading. [X2205

Ariel

CROW Bros., High St., Guildford.—Ariel agents since 1913. 1919 deliveries have begun. [5299

1916 Ariel 5-6h.p. Twin Combination, excellent condition; £110.—Grimmer, West Walton, Wisbech. [X2092

ARIEL 3½h.p., Druids, lamp set, horn, absolutely smart; £50; no dealers.—91, Fairfield Rd., Bow, E. [4669

JONES Garage, special agents for Ariels, Broadway, Muswell Hill, N.10 and Woodside Parade, North Finchley [2929

1916 Ariel, 3-speed countershaft gear, lamps, horn, coachbuilt sidecar; price £95.—Dix, 6, Bridge St., Cambridge. [4158

ARIEL, 3½h.p. and 6-7h.p.; early deliveries.—F. Sneakman, Ariel Expert, 7, Rochdale Rd., Harpurhey, Manchester. [4020

1919 Ariel 3½h.p. Combination, new end June, lamps, horn, tools; £140, or near offer.—Belmont, Lyme Regis, Dorset. [4096

1915 3½h.p. Ariel Combination, 3 speeds, clutch, excellent condition, fully equipped; £75.—286, Hertford Rd., Lower Edmonton. [X2247

1918 Ariel Combination, Lucas, accessories, complete, fine condition; £105.—Eveson Bros., Ltd., The Dingle, near Stourbridge. [X1812

ARIEL, 3½h.p., late model, 3-speed countershaft, Ariel coach sidecar, very smart outfit; London district; £110.—Box L4,029, c/o *The Motor Cycle.* [4142

ARIEL Coachbuilt Combination, late 1914, 3½h.p., 3-speed, clutch, kick, lamps, new tyres, excellent; £80.—Parritt, 14, Stanhope Gardens, Highgate, N. After 6. [4610

ARIEL Combination, 1919, 6h.p., countershaft, new 20/4/19, Mills-Fulford sidecar, Powell-Hanmer lamps, trip speedometer, Klaxon, Tan-Sad, complete with valuable spares, mileage 987, privately owned; lowest £140 cash.—Apply after 7 p.m., Beverley, Oxhey Rd., Bushey, Watford. [X2174

ARIEL 1919 6h.p., just delivered from makers, and brand new Gloria C.B. sidecar de luxe, large Lucas lighting set, Lucas horn, complete tool kit, pump, Easting wind screen, extra apron, luggage and petrol carriers; 165 gns.—The Seven Dials Motor Cycle Depot, Prestonville Rd., Brighton. [4643

Armstrong.

ARMSTRONG Motor Cycle, 3½h.p., spring forks, mag., handle starting, splendid condition; £35.—Murray, 37a, Charles St., Hatton Garden, Holborn. [X2026

Arno.

ARNO 3½h.p., new tyre and tubes, good condition; £45; after 6.—G. Beecham, Claypole. [X1917

ARNO 4h.p., 1914, 3-speed, handle-bar clutch, new Dunlops, lamps; £50.—Yapp, 32, High St., Congleton, Cheshire. [X2252

Auto-Wheels.

AUTO-WHEEL, B.S.A., good condition; £11.—56, Crown Rd., E. Twickenham. [4032

AUTO-WHEEL, complete, but needs repairs; what offers?—287, High Rd., Leyton. [3934

WALL Auto-wheel, good condition, not run 800 miles, stored 3 years; £11/10.—Stradling, Hungerford. [3797

AUTO-WHEEL, attached Rudge-Whitworth (gent's); £16, complete, or separate.—Fox, 94, Army St., Clapham, S.W.4. [4667

AUTO Wheel, model de luxe, splendid condition £12.—18, Bellevue Gardens, Clapham Rd., near Swan, Stockwell, S.W.9. [4631

AUTO-WHEEL, mileage 200, as new; any trial, £12; with cycle or tandem £19.—Harris, 7, St. Luke's Rd., Westbourne Park, W.11. [4718

AUTO-WHEEL, 1914, stored 3 years, new tyre, tube, £12; with cycle or tandem, £20, offers.—Harris, 7, St. Luke's Rd., Westbourne Park. [3433

AUTO-WHEEL, excellent condition, handle-bar controlled ignition, very powerful; any trial; including accessories and spares; 12 gns.—1, Florence Mansions, Rostrevor Rd., Fulham, London. [X1989

Bat.

BAT-J.A.P. 6h.p., 2-speed, Gloria sidecar, with accessories; £90; ride away.—Barton, 5, Station Parade, Palmers Green, N.13. [X1996

MOTOR CYCLES FOR SALE.

Bat.

BAT-J.A.P., late 1914, 6h.p., 3-speed, clutch, Millford coachbuilt sidecar, £80; also Morgan; call after 7 p.m.—9, Morland Rd., Ponge. [3997

B.A.T.-J.A.P. 6h.p. Combination, 1915, Bosch, countershaft, 3-speed, Swan sidecar, lamps, screen, hood, excellent condition, etc.; £120, or offer.—14, Lonsdale Rd., Queen's Park, N.W.6. Bakerloo Tube. 'Phone: Willesden 1336. [4473

1913-14 8h.p. Bat-Jap, all-chain drive, spring frame, C.B. sidecar, in thorough order; any examination and test; enamelling and plating in grand order, not scratched, and not faked up; £95 secures, no offers.—Apply, Schlienger, 19, Argyll St., W.C. [4203

BAT-J.A.P. Special Sporting Combination, all rigid enamelled Indian red, inlet and exhaust valves, overhead mechanically operated, round tank, coachbuilt bullet shape sidecar, good tyres, steel discs fitted, very smart, racy turnout, no gears or clutch; lowest price, £85.—E. Davies, 21, Bulkeley Rd., Poynton, near Stockport, Cheshire. [X2224

Blackburne.

CROW Bros., High St., Guildford, are old Blackburne agents, and can give early deliveries. [5300

STANLEY RUSSELL, Newport, sole Isle of Wight agent for Blackburne motors; early delivery. [4016

BLACKBURNE.—Sole agents. Book now for early delivery.—Chandler, Reyre and Williams, Snn St., Hitchin. [0999

JONES' Garage, special agents for Blackburnes, Broadway, Muswell Hill, N.10, and Woodside Parade, North Finchley. [2932

BLACKBURNE, latest model, ridden about 1,500 miles, lamps, horn, and tools, new condition; £80.—Thomas, Southgate, Chichester. [4288

Bradbury.

NEW 4¼h.p. Bradbury, single speed machines delivered from stock. Wauchope's, 9, Shoe Lane, London. [4639

BRADBURY 4h.p., 1914, clutch, perfect condition, ride away, buying combination; £38.—26, Vicarage Rd., Leyton. [4479

4h.p. Bradbury C.B. Combination, had very little use, splendid condition; £66.—E. Huxtable, 10, Clarence St., Gorton. [X2155

BRADBURY 4h.p. Combination, 2-speed, free engine, splendid condition; £45.—72, Gleathorne Rd., Hammersmith, W. [3855

BRADBURY 1914 4h.p., mechanically perfect, very powerful, tyres good, head lamp; £35.—Ransome, 2, Willow Grove, Chislehurst. [4197

Accumulator Electric Lighting.

Complete Set, 120 -

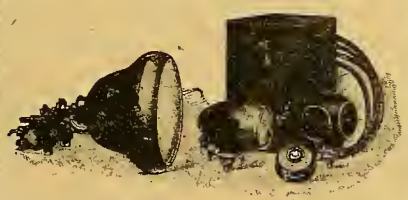
For Solo Machines. This set contains head lamp and tail lamp of the latest approved design, with adjustable handle-bar fittings. The box to fit on the top tube contains a 4-volt accumulator and a switch, giving sufficient light for the two lamps for approx. 10 hours at one charge. It, without doubt, fills a long-felt want for solo machine lighting.

ELECTRIC ADAPTER.

Price 4/9 each

Spare Bulbs, 2/- each.

This is a small fitting to enable owners of gas lamps fitted with burners of the Roni type (round stem) to make their lamps into electric. The "adapter" fits over the existing burner with a tight fit, and is connected to an electric wire and battery.



7in. Sidecar sets, complete, as above £8/8/0

5½in. ditto ditto £7/15/0

7in. Lamp only, with handle-bar fittings 65/0

5½in. ditto ditto 52/0

EASTERN GARAGE

IMPORTANT ANNOUNCEMENT.

We much regret that, in consequence of short deliveries, we have been unable to execute some of the many orders for motor cycles which have been placed with us this season, and we fear a number of our clients will not now require their new machine.

We therefore beg to announce that in addition to continuing our policy of

Refunding Deposits in Full

and without question we have decided to pay to our clients who desire to cancel their orders

Interest at the Rate of 5%

per annum on the amount of their deposit.

At the same time we feel bound to

Warn Our Patrons

that the demand for machines next spring will probably be far more in excess of the number available than has been the case during the present year, and that they will be well advised to retain the

Priority in Delivery

to which they are now entitled. We shall be greatly obliged if clients, whose orders we still have in hand, will communicate their decision to us, so that we may immediately comply with their wishes.

BOOT

REPAIRING

"Elite Holdtite Rivetless Soles."

Soles STUCK ON.—

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdtite Sol-fix solution. **We guarantee them to hold as firm as rivets or sewing.** This process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof.** Full instructions given with each pair of soles

4 h.p. Triumph Engine, frame, and tank £19 10
Douglas 2¾ h.p. Engine £12 10s., Gear Box.. £7 10

Cameo Screens, £3; Easting Screens, £4 10s.; "Perfection" Coach Sidecars, £16 16s.
"Perfection" Coach Bodies from Stock.

MOTOR CYCLES FOR SALE.

O.K.

O.K., 1917, 2¾h.p. J.A.P. engine, countershaft 2-speed, very good condition all respects, little used; any trial; £48, or offer.—6, The Avenue, Tonbridge. [X1970

1915½ 2¾h.p. O.K. 4-stroke, J.A.P. engine, absolutely perfect condition, overhauled, enamelled, new Dunlops, 2-speed countershaft, lamps, spares, been stored; £38/10.—H. Smith, Wetwood, Eccleshall, Staffs. [X1666

Omega

OMEGA-J.A.P. 2½h.p., 2-speed, a.i.v., good condition; £30.—96, Green St., High Wycombe. [4228

STANLEY RUSSELL, Newport, sole Isle of Wight agent for Omega-Jap motor cycles; early delivery. [4018

1919 2¾h.p. Omega-Jap, Albion 2-speed gear box; price £50.—Napier, Aldersyde, New St., Kenilworth. [X1690

1919 Omega-Jap, 2-speed gear, perfect condition, delivered August; owner bought larger machine; highest offer over £60.—Hands, Burton Walks, Loughborough. [4080

Overstone.

OVERSTONE 1919 2¾h.p., bought 6 weeks, mileage 100, all spares; £55.—28, Rose Lane, Mossley Hill, Liverpool. [3868

VILLIERS-OVERSTONE 1919 New 2-stroke, 2-speed; £55, offers.—Outram, Rectory Rd., Southport. [X1808

P. and M.

P. and M., 1919, delivered Feb., perfect condition; price £90.—Dr. Tippett, Rashcliffe, Huddersfield. [4356

1919 P. and M. Combination, ridden 50 miles, unscratched; £122.—5, Cottage Grove, Bow, E. [4672

P. and M. 3½h.p., 2-speed, Bosch, lamps, horn; exchange considered.—Westacre, Droitwich. [X2226

P. and M. Combination, 1914, good order, all accessories; £80.—J. Smith, 230, St. John St., E.C.1. [4026

P. and M. Combination, late 1913, 2-speed, kick start, speedometer, lamps, perfect; any trial; £70.—1, Priory Rd., Kew Green. [4581

1919 P. and M., R.A.F. model, delivered June, excellent condition, new tyres, lamps, horn; £90, or best offer.—44, Victoria Rd., Keighley. [X2095

P. and M. 1913 3½h.p., 2-speed, splendid running order; seen any time; £50, or near offer.—4, Knockholt Mansions, Ravensbourne Park, Catford. [4201

P. and M., 2-speed gear, free engine, chain drive, fitted with handsome light coachbuilt sidecar, hood and accessories, good as new; £80; on view any time.—58, Peckham Rye, S.E.15. [4055

BRAND New 1919 P. and M., straight from makers, and perfect in every way, never been ridden; best offer over £100; owner buying car.—Box 319, c/o *The Motor Cycle*. [X1695

P. and M. Combination, Turner No. 3 coachbuilt sidecar, 4-point attachment, condition good throughout, lamps and accessories; £90; any trial by appointment.—Riches, Roseneath, Bury Rd., Harlow, Essex. [4468

FOR Sale, 1919 model P. and M. and sidecar (P. and M.), in perfect running order, used only 1,000 miles, P. and H. head lamp and generator, sidecar lamp and generator, rear lamp and generator, spare cover, new covers on all wheels; £125, no offers.—Apply, Lieut. Geddes, Craig Mount, Peebles, N.B. [4030

Peugeot.

PEUGEOT Twin, 2-speed, mag., running order; after 6; £25.—108, Borough Rd., London, S.E.1. [4618

PEUGEOT 2¾h.p., 1914, 32 gns.; ride away.—89, Dartmouth Rd., Brondesbury, N.W.2. [3878

Precision.

PRECISION 3¾h.p., 2-speed, £35; lightweight. £15.—42, Prince's Rd., Holland Park. [4272

2½h.p. Precision Lightweight, 2 spares, o.h. valves, perfect; nearest £30.—159, St. Anne's Rd. East, St. Anne's-on-Sea. [X2293

PRECISION, 2¾h.p., 2-stroke, 1915, perfect condition, lamps, horn, etc., take 2 anywhere; £36.—2a, Ladbroke Grove, Holland Park Av., W.11. [4186

3¾h.p. Precision, 1912, B. and B. variable jet carburetter, Bosch waterproof mag., adjustable pulley, Miller lamp set, in good order, just overhauled; £27; seen after 6 p.m.—Glossop, Lee Green, Cliffe-at-Hoo, Kent. [X1936

Premier.

PREMIER 3½h.p., 3-speed, kick start, Bosch, B. and B.; £55.—54, High St., Camberley. [3780

PREMIER 3½h.p., all accessories, any trial; real bargain, £45.—C., 26, Powell Rd., Clapton. [X2113

3½h.p. Premier, lamp, horn, ride away; bargain £29.—White, 21, Brighton Rd., Addlestone. [4501

PREMIER Motor Cycle, 3½h.p., free engine, lamps horn, etc., in good running order; £38.—Thrall Skegness. [X2241

This Week's Six Days Trials.

ONCE again, after a lapse of five years, we have returned to the serious business of the motor cycle world. The Six Days Trials and the Tourist Trophy Race have always been *the* events of the year, and since the latter could not be arranged for 1919, much interest and importance are added to the trials held this week.

At Llandrindod Wells there is a large assembly of trade and competition riders, and though many familiar faces are absent—some, alas! to be seen no more—there is a touch of pre-war times in the atmosphere which no other motor cycling event could produce. The classic Six Days Trials of the A.C.U. have a far-reaching effect. The buying public of the world to a great extent is watching these trials with interest, and the manufacturers of successful machines are likely to reap a well-deserved reward. Here it may be mentioned that, so far as the competing machines are concerned, real novelties are few and far between. Amongst the most practical tendencies are the fitting of electric lighting installations to many, if not most, of the passenger outfits. There is but little sign of dynamos for solo machines, though the A.B.C. is a particularly neat and striking exception. Brakes are improving or, at any rate, have attracted the attention of designers.

Few Spring Frames.

New spring frames are not much in evidence in spite of the bad roads—in fact, one rider of a spring frame machine has reverted to a rigid frame, as the sprung type is not considered suitable for a gruelling trial. Spiral and leaf springs seem to be fairly evenly represented.

Generally speaking, there is an improvement in mudguarding, much wider guards being fitted, especially to sidecar machines, whilst undershields and leg-shields are also making an appearance as integral portions of the motor cycle. The methods of securing them also exhibit improvement. With regard to chain cases, it is significant that many old riders prefer their absence to their presence for competition work, where a single stop of but short duration destroys all chances of a first-class award. This points either to a lack of confidence in the strength of the chains fitted to the standard motor cycle or to the difficulty of removing and refitting the casing, should it be necessary to remove the wheel for tyre repairs.

In respect of noise, there would appear to be a considerable improvement, at any rate in certain cases, and perhaps the possibility of Dr. Low's presence with his audiometer is partly accountable for this welcome feature. We are inclined to think that the maximum penalty for a noisy machine is not sufficient, for nothing is so prejudicial to the pastime and industry as a noisy exhaust and rattling valve gear.

The general impression to be gained from a survey of competing machines is that manufacturers are using the trial as a test for certain features or modifications, and that we shall have to wait at least till the Olympia Show for the final product. Improvisations are, of course, plentiful; here one finds a novel way of carrying a spare tube, and there a guard to protect some vital part from the ravages of mud and water. This is not as it should be, for standard machines should be provided for all the exigencies of modern touring. It may be argued that the A.C.U. Six Days Trials are not a pleasure tour. This is true indeed, but nevertheless they have been instituted with the idea of improving touring motor cycles, and consequently the fitting of such devices as are outside the standard specification is not likely to create a favourable impression on public opinion.

There are many interesting mechanical features, most of which are decided steps in the right direction, but it will be more fitting to deal with them from a technical standpoint when their merits have undergone practical demonstration.

An index to the advertisements in this issue will be found on the page facing the back cover.

BY IXION

A New Sensation in Motor Cycling.

IT is rather odd that the average rider is taking no special interest in spring frames, especially as they are not necessarily either heavier or more expensive than the rigid types. I suppose the explanation of this apparent callousness is that we are all thankful to get delivery of any old thing, and that we can only exercise fastidiousness when supply is about equal to demand. At any rate, let me once again assure our readers that the eulogies which our staff have repeatedly awarded to spring frames are not hot air. The contrast between an ordinarily good spring frame and the best rigid frames can hardly be exaggerated. I ride both types alternately, day in and day out; and, to be quite frank, I would never straddle another rigid frame but for the exigencies of my calling. I am sure there will be a huge slump in rigids when the possibilities of fore and aft springing become common property.

An Aggravating Brake.

WHEN riding in company, a certain amount of waiting at corners is necessary to avoid losing one's pal, who may have taken a false turning or sustained roadside trouble away back. During such a wait last week, I noticed that the rear chain of my 1919 machine had developed an excess of droop, and blithely proceeded to tighten it. I had never essayed the job with the machine before, and I noted with approval the substantial character of the parts concerned and the ease with which they slid into the desired positions. Being a cautious man, at least when I am out of the saddle, I glanced at the back brake before hurtling astern in search of my missing friend, just in case the new chain setting had upset the brake adjustment. Not unnaturally I found that it had. The brake would go on with excessive vim, but absolutely refused to come off. Since I am apt to ride rather "blue," my brakework on occasions resembles Beckett's punch, the sequence being: A No. 10 boot goes plonk on the pedal, deft wrists correct the resultant swerve, and on I go again. With a brake that will not come off by itself, such jockeyship is dangerous, so out came the spanners again. A series of discoveries followed. Item: the belt rim was not true. Item: the brake shoe fulcrum eye was drilled out of truth, and could not enter the rim accurately. Item: the pull-off spring was stretched at a false angle, and exerted little influence on a reluctant brake shoe, should the latter elect to jam in the rim. Finally, I got the brake to free itself by dint of setting the back wheel slightly across the track. Bad design and worse workmanship, was it not, gentlemen? I really wonder that no firm has yet produced a back wheel which *cannot* be adjusted across the track, for, as I pry about garages, I notice many machines with their rear wheels running askew. I believe that rear brake design requires fresh attention now that all-chain drive is booming. This is my third trouble of the kind this season, the other two relating respectively to an insecurely anchored cable and to a brake drum which moved away from an immovable fulcrum every time the chain was adjusted. A few years ago rear chain adjustments necessitated two other adjustments, viz., to the gear control and to the rear brake. Messrs. Sturmey-Archer and others have eliminated the need for resetting the gear control, but there are still many machines on which a rear chain adjustment upsets the action of the rear brake.

Curse that Fitter.

I WAS ambling out to a distant golf links this morning, when my front tyre began to bump faintly in that execrable fashion which betokens a pinhole puncture. I dismounted as blithely as any saint could do, considering what tyre repairs imply in a heat wave when one is swathed in overalls of the type that take ten minutes to get into. But the old Adam produced a few ripe ejaculations when I found that my brand new pump showed a mean effective pressure estimated at a rose leaf and a half per square inch. Being a man of infinite resource, I dismounted the pump plunger in order to immerse its washer in the oil tank and so improve the compression. But, gentlemen, there was no washer on the plunger, and I was miles from human habitation. I sat down by the roadside to await some friendly cyclist. After ten minutes I began to debate whether the required washer should be hacked from (a) the saddle, (b) the toolbag, or (c) a favourite baccy pouch, when a human ploughboy arrived and lent me a pump.

The Rarity of Good Steering.

IT is gradually being borne in upon me that there are only one or two designers in the kingdom who know how to lay out the steering of a motor bicycle. My stable at present houses two machines, both of which I ride regularly over baddish roads, and both of which bear very famous names. I can steer machine A with one hand and in perfect comfort over all the roads which I normally frequent; in fact, except when grease is about, I usually steer it with the second, third, and fourth fingers of my left hand. By contrast, machine B requires two hands all the time, and demands special wariness over deep potholes, rough metal, or a ruts-and-hump road. Yet the latter mount is the more famous of the two. It is true that machine A has a spring frame, but I do not think the rear springing affects the steering in the very least in this case. I could name a third machine which steers better than either of the pair on good roads, though it is inferior to machine A on really

Occasional Comments.—

bad roads. I presume that the manufacturer of B has never tried a machine with decent steering, and does not know what an exacting beast he is selling. Last week I tried the experiment of lending B to a very experienced rider without warning, and awaited his comments with interest. He just said, "Some engine, eh? But I should like to try it on decent roads; these lanes fairly put the wind up me. I don't quite know what's the matter with them, but I felt as if I simply couldn't steer." He failed to tumble to the fact that the machine was to blame, and that on his own mount he would have roared over my local surfaces in an effortless beeline.

Complicated Gear Changes.

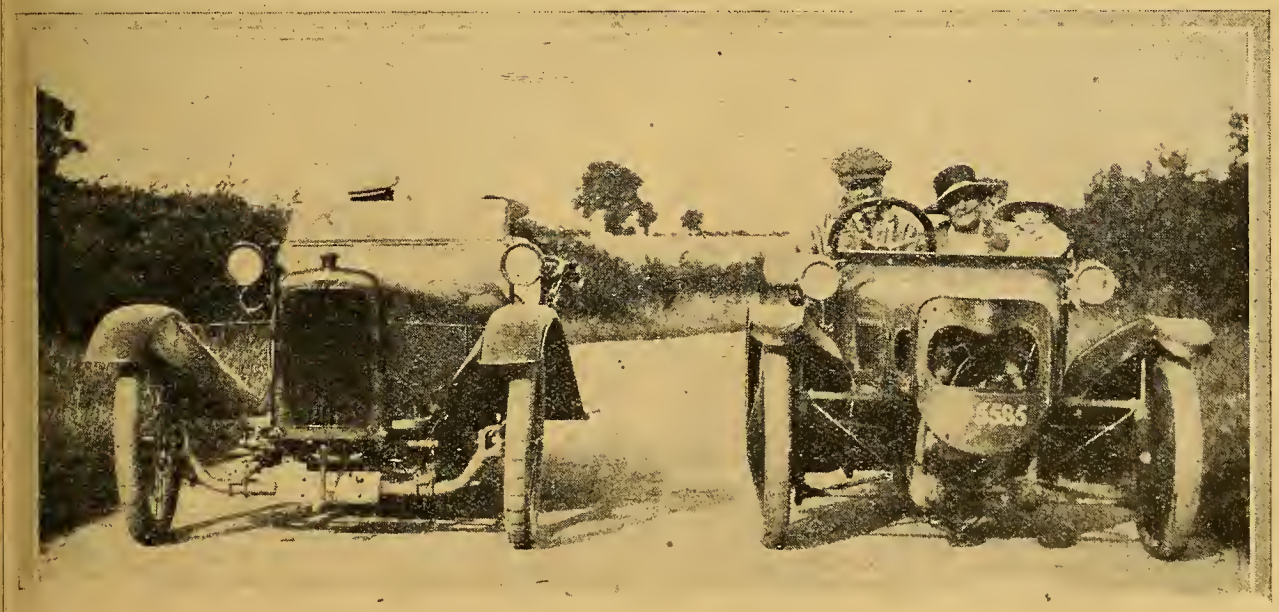
I SUPPOSE some day the ideal gear change system for motor cycles will come along. Enthusiasts for individual makes probably regard the change with which they are familiar as ideal, but the harassed journalist, confronted with a different system every week-end, knows how awkward most of them are. Leaving the questions of clutch and throttle control on one side, I have tackled the following different methods in the past fortnight:

1. Four-speed box; four-notch gate, set across the machine.
2. Three-speed quadrant, set along the machine.
3. Rotary knob.

I think any unprejudiced rider would admit that a day on any unaccustomed three or four-speed gate or quadrant in freak hill country is apt to be annoying. The four-speed change is particularly tiresome, because the required movement is too long for a quadrant, and the "gate" is so tiny that the central opening for the crossover is easily missed. Some readers will say that the case of a journalist does not really matter, seeing that ordinary owners ride one machine only, and rapidly become used to it. I beg to differ. Very many riders remain clumsy gear changers with any box less simple than a two-speed. Most owners are clumsy and uncertain for a few weeks with a new make of gear box. These badly made gear changes are by no means good for the machine. The B.S.A. designer knew what he was about when he devised a box that could safely be changed down without declutching. He scored one point on convenience, and two points on wear. So far as my experience goes, makers should pay more attention to foolproof gear changes, especially on four-speed boxes; the longitudinal quadrant, applicable to most three-speed boxes, is not too bad. As a sample of owners' ignorance, I recently encountered a man who had been riding for three seasons, and was still unaware that there was a neutral position of his gear lever.

Two Nuts and a Bolt.

STOPPING to consult a map the other day, I noticed that my new hooter had shed one of its securing nuts. I lashed it up temporarily with a pocket handkerchief, and called at the next garage to obtain replacements. This trivial incident led to several discoveries. In the first place, the hooter manufacturer uses B.A. threads, and spare bolts are therefore hard to come by. Why he uses an uncommon thread, goodness knows; possibly he fancies that it will stand vibration better; nevertheless his theory did not prevent my hooter shedding a nut. I decided that an ordinary ¼in. Whitworth bolt would serve my turn, and added a couple of nuts for safety. The charge was 10d.—5d. the bolt, and 2½d. for each nut. Incidentally, I am going to stick to my improvised fitting. The head of the Whitworth bolt is locked by a shoulder on the hooter clip, whereas the original bolt could not be tightened without using a pair of tools. But if a small bolt with two nuts costs 10d. in these days, what is the commercial price for a Rolls-Royce?



THE VOGUE OF THE RUNABOUT.

The Premier "Super" runabout, a new three-wheeler of attractive design, alongside a Morgan, the prototype of the modern three-wheeler. It will be seen that although the former closely resembles a conventional light car, its height and general dimensions approximate to the Malvern machine. The Premier has a 7-9 h.p. water-cooled V-type engine, three speeds and reverse, chain drive, and detachable wheels.

The Outlook for Motor Cycles in France.

A Bleriot Motor Cycle—French Company to Manufacture the A.B.C.—British Manufacturers' Prospects—Forthcoming Competitions.

By W. F. BRADLEY.

FRANCE, which has always been backward in the use of motor cycles, is on the eve of a boom in these popular machines. The war is responsible for it in a very large measure, for the development of the Motor Transport Corps of the Army has initiated thousands of men to motordom, who otherwise would never have solved the mysteries of the internal combustion engine, and the introduction of the eight-hour day—another war measure—has given the workers time for sports and recreations.

Undoubtedly it will be a long time before motor cycles are as plentiful in France as in England, for the Frenchman does not part with his money so readily as his ally across the Channel, but there is no doubt that the boom is coming. The peculiar thing about it is that the French manufacturers are not at all prepared for it. One firm, the Clément Co., sees so little future in the motor cycle that it has already decided to drop the power-driven and devote itself to the push type of bicycle. This policy is hard to understand in view of the success of the Clément machine during the short time it was on the market prior to the war.

Growing French Interest.

On the other hand, Blériot is about to manufacture a motor cycle, and there are rumours that De Dion Bouton, whose range already runs all the way from tractors to bicycles, is about to add a motor cycle department. The most important development, however, is the formation of a powerful company to manufacture and market the A.B.C. machine in France. This machine is now being built near Paris by the Gnôme and le Rhône Co., a world-famed firm which has grown big during the war on the manufacture of rotary air-cooled engines.

The business manager of the French A.B.C. Co. is an Englishman, Mr. Graeme Fenton, who, prior to the war, occupied a similar position with the Clément Co., and helped to make Clément machines popular in both racing and touring competitions.

The French motor cycle boom will be a wonderful opportunity for English makers. Without any false pride, it can be asserted that English machines are classes ahead of French productions. There is nothing surprising in this, for while the French have preferred to ignore the motor cycle, the English have been using them in thousands, and have accumulated experience which has been turned to good account in successive models. The best known machines in France are Douglas, B.S.A., Triumph, and Rover. Others are coming, however, and hardly a day passes but one hears of additional agencies having been obtained for British motor cycles.

There will be some competition from America, for during the last two years the American Army has helped to make Harley-Davidsons, Indians, and Reading Standards known to the French public, and these agencies have been secured by enterprising French dealers, who hope to do business as soon as import duties permit.

French enthusiasts will have the opportunity of deciding between the big powerful American machines and the smaller and more economical English mounts without any false notions as to maintenance. It had been expected that before this date American motor cycles would have been operating on the streets of Paris as taxis. They have not done so yet, owing to the impossibility of getting delivery of Army stocks. The American forces had about three years' reserve stores of all kinds to dispose of. The French were anxious to secure these, but wished to pick and choose, and among the things they decided to decline were the American motor vehicles. The matter could not be settled on these lines, and in the end the whole of the stores had to be taken. This has caused an important delay, and even yet it is doubtful if the Paris motor cycle taxi company has secured possession of its American machines.

Competitions of all kinds are announced. It is true they are not of great importance, but they indicate a healthy condition, and they contribute largely towards the spread of the movement. The latest of these events is the Paris Belt competition, or rather demonstration, to be held on September 21st. A roughly circular route, about 130 miles in length, has been mapped out around the city of Paris. On the south it almost hugs the city walls, but on the east, the north, and the west it goes far afield. All that is required of the competitors is that they shall maintain an average of thirty kilometres (eighteen miles) an hour for the entire distance. A simple event at first sight, but not so easy when account is taken of the awful condition of some of the roads around Paris. Rough *pavé* which has carried intensive loads without repair for more than five years, and macadam which never was known to be good, are apt to reveal defects in really first-class machines. Then there are a few hills of a fairly serious nature.

Continental Conditions.

It is encouraging to note that English machines are taking part in these French events very freely. Proud as we are of our product, there is a lot to be learned from Continental competitions. Everybody who has had experience abroad will admit that touring conditions are very much harder across the Channel than at home. Speed kills, and French roads are an open invitation to speed. Some of the Continental hill-climbs, too, are likely to be a revelation to British riders, and of valuable experience to English makers. Steep as are some of the gradients in Great Britain, they are so short that they are no real test of any engine.

I have an English friend in Italy, who has taken part in many of the Italian Alpine climbs on British machines. He says he has never had a British machine which could cover the twenty miles of steady climbing up Mont Cenis on a really hot day—say 120° or more—without conking and overheating fearfully. He still maintains that the English are the best all-round machines, but he asserts that they are inferior to the foreigners in the matter of cooling.

THE 5,000 MILES BENZOLE TEST.

The A.A. Extended Test of 1920 Triumphs Running Solely on National Benzole Association Motor Spirit.

AS stated in our last issue, the extended test of benzole used as the fuel in a standard air-cooled engine commenced on Thursday, the 11th inst.

This trial, organised by the Automobile Association, will follow on general lines that already undertaken on a Sunbeam car—and which, in the first instance, was projected largely as a result of suggestions emanating from the editorial department of our sister journal *The Autocar*.

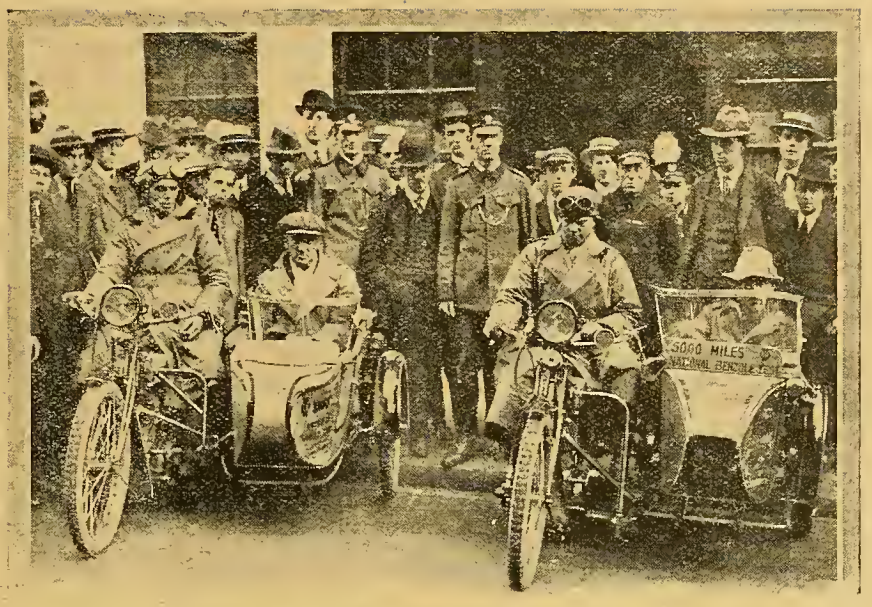
When the car test was discussed, it but needed the expression of our own regret that the motor cycle was not likely to gain to the fullest extent by the reports which would be drawn up, to induce the fuel department of the A.A. to at once put in hand arrangements for the trial now under review.

The particular machine selected for the purpose is one of the 1920 chain-driven Triumphs with Gloria sidecar, and this is accompanied by a sister outfit, which is acting as a tender.

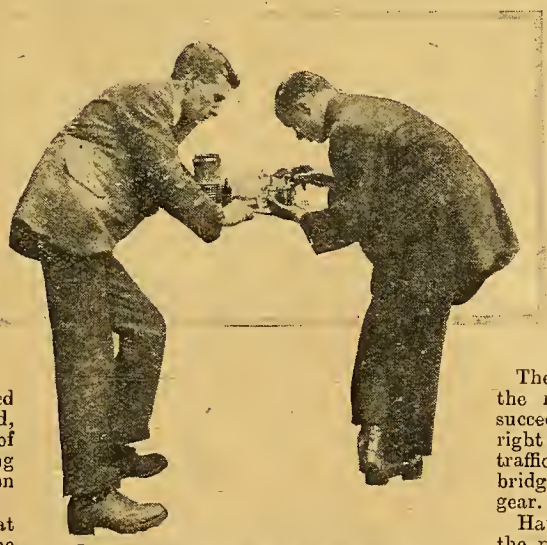
A few days before the start we were present at a final examination of the engine parts on which benzole might, according to some people, have a deleterious effect. This scrutiny was conducted by representatives of the engineering department of the A.A. and the Triumph Co., an engineer nominated by the Institute of Automobile Engineers, and a member of the staff of *The Motor Cycle*.

Subsequently the engine was assembled and tested, then the tank was drained, and thereafter, until the completion of 5,000 miles, it is not to receive anything but spirit conforming to the specification of the National Benzole Association.

At the appointed hour we arrived at the Triumph works, and there noted the very elaborate arrangements for sealing the engine ports in order to prevent removal during the progress of the trial.



The two 4 h.p. Triumph outfits at the A.A. headquarters, Fanum House, previous to starting on the 5,000 miles benzole test.



Careful observation was made of the working parts, with a view to making comparisons at the finish of the trial.

The valve caps, plug, oil pipe, and cylinder nuts were all wired and sealed in such a way as to render removal impossible without detection.

A special measuring device was also employed, by which an accurate quantity of spirit could be supplied to the tank. The oil and petrol filler caps were fitted with locks soldered to the tank.

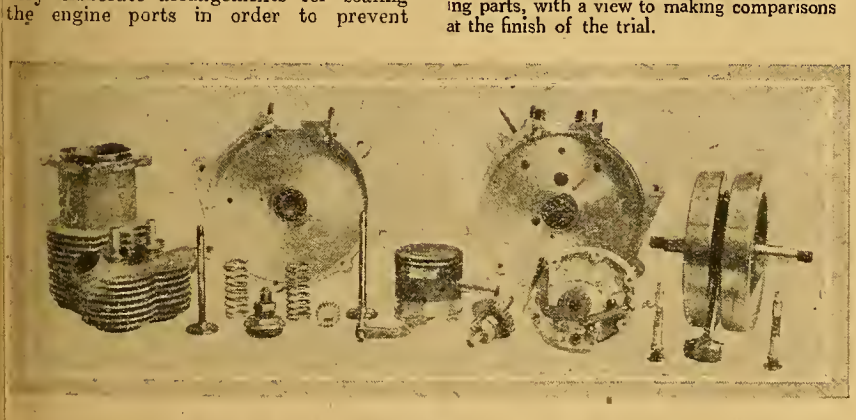
One gallon of benzole being measured into the machines, a start was made, and, thanks to most glorious weather a delightful run was made to London.

The test machine covered 105 miles on the measured gallon, while the tender succeeded in travelling from Coventry right across London, including dense traffic in Edgware Road and Knightsbridge, without once coming out of top gear.

Having refilled tanks in Kensington, the party headed for Fanum House, the G.H.Q. of the Automobile Association, where a large crowd of spectators and press photographers had assembled. Having made final arrangements and shaken hands with everyone from Major Stenson Cooke to the D.C.M. road patrol sergeant, we left Leicester Square behind us, heading northward on the first stage of the 5,000-mile journey, covering parts of England and Scotland.

The test machine and sidecar, driven by H. Finch, who was one of the winning team in the recent M.C.C. Inter-club Trial, weighs unladen 546 lb., and with passengers 826 lb. The tender is being driven by C. R. Little, of the Triumph Co., and carries as observer a member of the A.A. Engineering Department.

At the end of 2,000 miles the engines will be decarbonised. Meanwhile we shall keep our readers informed as to the progress of the machines from week to week.

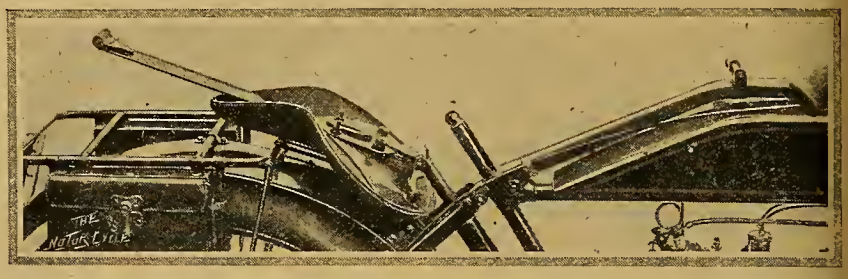


One of the 4 h.p. Triumph engines completely dismantled.

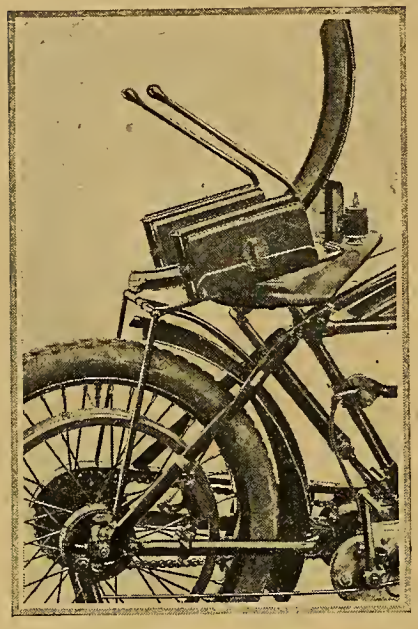
A NEW LONG-STROKE TWIN.

The 1920 L.M.C., with 7-9 h.p. Engine, 79 mm Bore, 98 mm. Stroke. 960 c.c. Capacity.

IT would seem that designers of motor cycles intended for sidecar work have agreed that for this purpose the long stroke engine has advantages not possessed by the "square" engine, which were generally installed in pre-war machines. Most of the new designs with which we have dealt in *The Motor Cycle*, and others at present in the experimental stage, are of the long stroke type.



Showing the new saddle suspension. A long leaf spring is used, pivoted at the front on the top tube, and at the rear on a spring loaded plunger.



The hinged rear guard designed to facilitate tyre repairs.

The new L.M.C. twin, which makes its *début* in the A.C.U. Six Days trials, has a bore and stroke of 79 mm. and 98 mm. respectively, the cylinder capacity being 960 c.c. Details of the machine entered for the Six Days trial are not yet available as it was finished only a day or so before the trial started. It has, in fact, been entered purely as a preliminary model to test its various features, and the ultimate design will be based upon the experience so obtained. This is somewhat the reverse of the more usual practice of entering well-tried machines for the purpose of demonstrating their reliability.

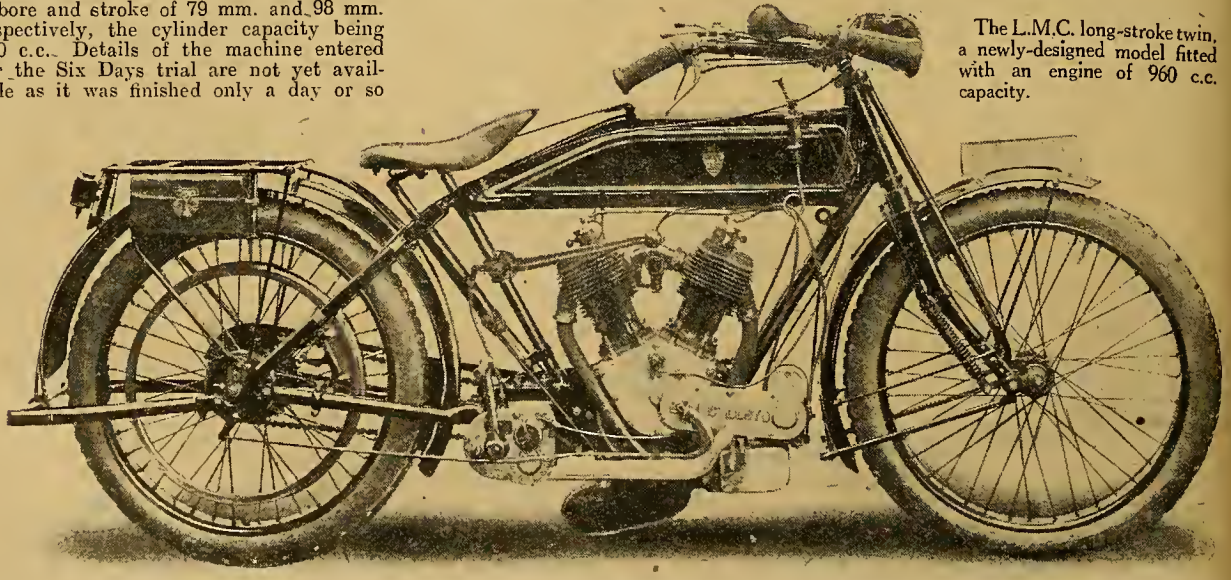
Apart from the engine, the new features of the machine include a redesigned frame, chain transmission with spring shock absorber in the rear hub, internal expanding brake with phosphor-bronze shoes, spring seat-pillar and footboards, 28in × 3in. tyres, and a hinged rear mudguard.

Springing the Rider.

Probably the most interesting feature of the new L.M.C. is the provision made for the driver's comfort. This takes the form of a spring saddle, which is connected to the footboards so that the whole of the driver's weight is carried on springs. The saddle is supported on a long leaf spring, pivoted at its forward end on the frame at a point nearly midway along the top tube. At its rear end the spring swivels on the top of a spring loaded plunger, which is connected by tension rods to the footboards. In addition to this springing system, the "seat-pillar" also contains a plunger with a roller head, which bears upon the centre of the main frame of the saddle. Below this plunger are inserted springs of predetermined strength to suit the weight of each individual driver. From a test of the seat we should say that it will provide a considerable increase in comfort.

Another feature of the machine is the hinged rear guard and carrier to facilitate repairs to the rear tyre. No tools are necessary to release the stays holding the unit at the fork ends. Studs are fitted which are sprung into position, when they are self-locking. The stand, too, assists in holding the hinged portion in position.

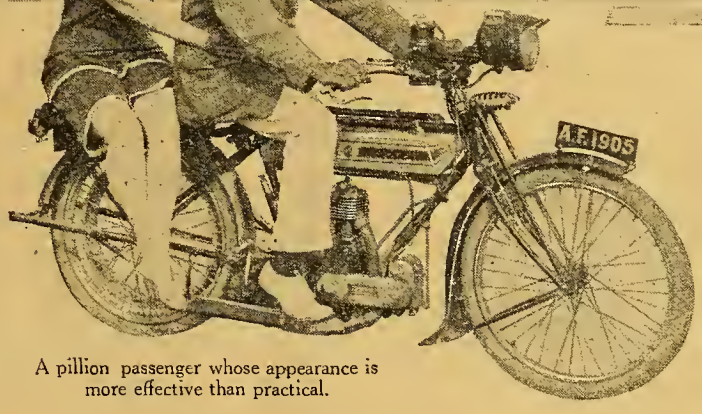
The new L.M.C., which is finished all black with the tank ornamented with a gold line, presents a very handsome appearance, and altogether should make an appeal to Overseas buyers on account of its sturdy construction, large wheels, and 6in. ground clearance.



The L.M.C. long-stroke twin, a newly-designed model fitted with an engine of 960 c.c. capacity.

Should Pillion Riding be Banned?

A Further Selection of Readers' Opinions on the Subject of Passenger Carrying on a Solo Machine.



A pillion passenger whose appearance is more effective than practical.

MANY letters continue to reach us on the subject of pillion riding, which show that in the unlikely event of its being prohibited by Government, a hardship will be inflicted upon many. We have never advised our readers to take passengers on their carriers, for we know that, under certain circumstances, the practice is attended with risk; it adds, moreover, to the difficulty of getting out of a tight corner. Still, it cannot be denied that many careful riders indulge constantly in this sport, with perfect safety to themselves and their passengers. Whether a passenger can be safely carried or not depends to a large extent upon the weight distribution of the machine. When the weight is well forward the presence of a passenger does not seem to affect the steering adversely, but, on the contrary, the added weight in the rear steadies the machine over rough roads.

It is true that coroners sometimes express very decided views upon this matter, but we confess that the outpourings of coroners do not greatly impress us. Still less do those of coroners' juries and town councillors. We want no grandmotherly legislation. Hunting accidents often occur, but we do not find the parish councils suggesting that hunting should be stopped by law. Driving to the danger of the public is already—and quite rightly—a punishable offence. Whenever it can be shown that the presence of a passenger on the pillion endangers the public it becomes an offence—surely this is enough!

Curiously enough, none of our correspondents have touched upon the sidecar pillion rider. There can be but little danger here to the public, or to the rider. In any case, a sprung seat which does not sway sideways adds both to the comfort and safety of the pillion rider, and eases the shocks which fall upon the carrier and frame.

Sir,—In reply to Mr. John Trewavas, jun., may I say that I have motored continuously since 1904, including the war period. Prior to that time I rode thousands of fast miles on a mixed tandem cycle. In 1918, as I could not take my family out, I bought a tandem, and put my invalid daughter (3 to 4 stone weight) pillion fashion. One ride—thirty miles—was sufficient. I sold the tandem.

Mr. Trewavas should try pillion on a tandem motor cycle; he would receive all the argument he requires.

If one could get the passenger's weight between the spindles I think it would be possible to carry a couple of passengers in safety, but as motor cycles are generally now constructed I should be hard put to to carry anyone pillion. If luggage as heavy as a passenger is carried the balance might be worse, owing to the difference between live and dead weight.

Manchester. S.W.

Sir,—I see in the newspapers that attempts are to be made to put pressure on our legislators with the object of prohibiting pillion riding. I trust motor cyclists will resist any such attempts. Pillion riding is described as a "dangerous" practice. No doubt to the staid old fogeys advocating its being made illegal it *does* "look" dangerous, but, considering the great extent to which it is indulged in, I think accidents are remarkably rare, and will compare favourably with other means of locomotion. The low centre of gravity of modern machines renders them quite safe with two up, except to those who are wilfully reckless.

No doubt there are many hundreds of motor cyclists who, like myself, have a limited purse, and equally limited accommodation, either of which circumstances rules a combination out of the question, and as even a motor cyclist likes to be *sociable* (who more so?), what can we turn to but pillion riding?

My own machine is a 2½ h.p. two-speed Levis fitted with Tan-sad spring seat (absolutely necessary with the present state of the roads), and a collapsible side footrest of my own contrivance. The engine has ample power for riding *à deux* even in hilly country.

Uttoxeter. NOMIDUROY.

Should Pillion Riding be Banned?

Sir,—I see a lot of correspondence in *The Motor Cycle* about pillion riding. Whether it is dangerous or not depends upon who is driving. An ordinary bicycle is dangerous in some people's hands, and I for one find pillion riding safer than a sidecar, but, of course, less comfortable for the passenger. I had my wife as passenger from Bournemouth to Keighley, in Yorkshire, last year, and did the journey in two days, as she got tired, and had to stop early the first day. We kept up a good speed, climbed all hills on top (3½ to 1) on an o.h.v. Bat-Jap, and found the greatest of ease in turning corners. I brought her back in a sidecar, and took three long days—slow speeds on hills, difficult in traffic, and tiring to steer, but I must own I am not a sidecar expert. SPEED MERCHANT.

Alderholt.

Sir,—I have read with much interest the articles and letters in *The Motor Cycle re* pillion riding. A little incident which happened to me may be of interest to some of the would-be sportsmen who think it dangerous. Most of the critics appear to be riders who think more about the extra wear on their back tyre than giving anyone a lift. Such people should be "warned off."

I took my mother for an evening run some five weeks ago in the sidecar. When about fourteen miles from home, the front sidecar connection broke. Being miles from a repair shop, which one does not find on the Welsh hills every mile or so, and the passenger being anxious to get home that night, I was puzzled. After disconnecting the sidecar, I left it in a barn to await my return two days later with a new connection, and my mother did not hesitate to ride on the so-called flapper bracket, on which there already was a pillion cushion. The age of my mother, I may say, is sixty-seven; I wonder whether it is not an age record for pillion riding. We arrived home safe and sound.

Pillion riding is not a bit dangerous, in my idea. When riding solo, to avoid any accident in town or country the greatest care has to be exercised. To have any responsibility behind them makes some folk nervy, and I venture to say that nervousness alone is responsible for all or the greater part of the accidents.

"A.C.R." in his letter talks rather wildly when he terms pillion riding "most dangerous." It *is* dangerous to the wear of the back tyre certainly, and that is all, I find. However, in conclusion, let all the over-stile helpers and sportsmen hope that "A.C.R." will never be stranded on the road, longing for a lift on the flapper bracket; if he is, let him remember what an extremely *dangerous* business it is.

I have a cousin who prefers to ride on the carrier, and thinks nothing of a jog from North Wales into the heart of Yorkshire on a Saturday and a return on the Sunday. He says cornering with the sidecar is not healthy. L.O.B.

Chester.

Sir,—May I say a few lines in answer to "Duggie's" letter in your issue of August 14th.

Whilst approving of pillion riding for those who feel capable of hanging on, and who have faith in their pilot, I must say that we people of Cambridge will be considered mad, if the rest of the country is allowed to believe that we "burble aroound the town with one on the tank, one on the saddle, and two on the carrier." If "Duggie" still claims to have seen this, I should suggest that he "take more water with it"—his vision may then remain clear. I certainly have seen overloaded combinations in the town, but never a solo machine with four up. I saw an Indian combination with two in the sidecar, one on the saddle, one on the carrier, and one standing on the sidecar luggage carrier, holding on to the shoulders of one of the sidecar passengers, but it did not "burble," it sounded more like a machine gun at close quarters. ANOTHER DUGGIE.

Cambridge.

Sir,—In discussing this subject there is one point which is often overlooked, viz., that there is a vast difference between riding on the bare carrier or with it thinly padded and riding on a properly constructed pillion seat, with back and footrests. In the first case, the swaying of the passenger is caused *(a)* through his changing his position owing to being uncomfortable, or *(b)* through his slipping when the driver swerves or turns a corner.

In the case of a passenger riding on a properly constructed pillion seat, he is prevented from slipping by the backrest on one side and the footrest on the other side. In addition, owing to the springing and the cushion, he will be much more comfortable, and, consequently, not always wishing to change his position. Further, some pillion seats are fitted with a handle for the passenger to hold on by. This is much more satisfactory than having him clinging to the driver.

Summing up, then, I think that any extra risk incurred by pillion riding is reduced by fully 80% if a good make of pillion seat is fitted. The only risk then outstanding being due to the slightly raised centre of gravity of the whole outfit. R. C. TAYLOR.

THE M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.

One of the features of the trial (fully described in last week's issue of *The Motor Cycle*) was the consistent running of the Ilkley team, the members of which all rode Scott motor cycles. Reading from left the riders are: N. O. Vinter (reserve), J. E. Walker, W. R. Haggas, W. Moore, W. L. Guy, H. W. Sellers, and W. F. Scott. The Ilkley team secured second place.

A Sensible Sidecar Construction.

Body, Luggage Grid, and Mudguard, mounted on Springs.

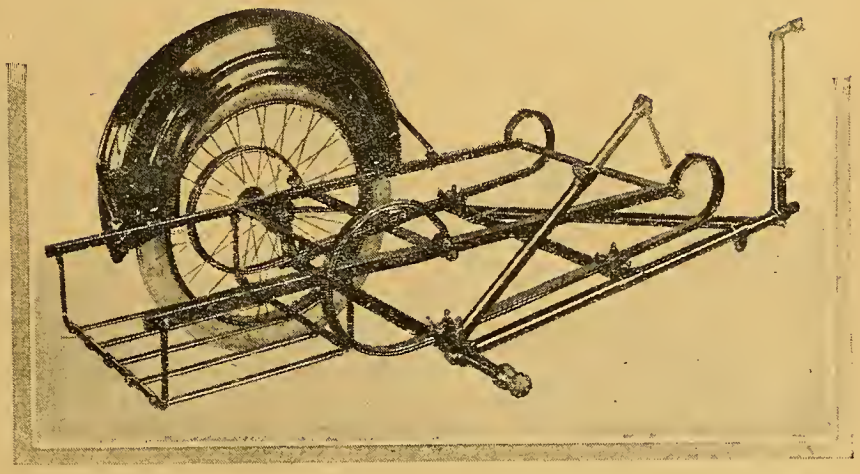
THERE are many devices so obviously simple and simply obvious that on our first sight of them we are tempted to ask the question, "Why was it never done before?"

Such a thought is at once aroused by the layout of the Rudge sidecar, which at once removes two of the greatest faults of the sidecar. We refer, of course, firstly to rigid luggage grid of the ordinary chassis, which when loaded with petrol cans, suit cases, etc., adds so much to the unsprung weight, and secondly to the normal type of fixed mudguard, which invariably shakes adrift at some period in its history.

Sprung Luggage Grid.

These undesirable features are obviated by the simple expedient of mounting an angle steel frame on the sidecar springs. On this frame the body is fixed on the usual cross stretcher-bars at the front and centre. The rear part of this subframe is extended to form a capacious luggage grid, while on the side member are two lugs with taper sockets into which fit the conical mudguard supports.

The chassis itself is quite simple and strong, of the under-slung type, and is fixed to the motor cycle by four points of attachment.



The Rudge-Whitworth sidecar chassis. Note the angle-steel framework, supported on springs, which insulate body, luggage-grid, and mudguard from vibration.

Exceptional finish characterises the bodywork, which is painted a dark green with a polished aluminium front panel; a convenient locker is provided in the rear panel. Thus it will be seen that the sidecar has large carrying capacity.

The Rapson Unpuncturable Tyre.

A Tyre Designed to Eliminate the Motor Cyclist's Bugbear.

MOTOR cyclists who do not follow the movements of the motor car world may be unfamiliar with the inventions of Mr. F. Lionel Rapson, whose trouble-saving devices have been chiefly applicable to the heavy four-wheeler.

An unpuncturable tyre has been the hoped for desideratum of all motorists, and probably by no class more than the solo motor cyclist, who has so little accommodation for carrying spare wheels, even when they are fitted to his mount.

The Rapson tyre aims at eliminating the necessity of carrying spares by preventing the occurrence of the puncture in the first place, and so far as car tyres are concerned, preliminary tests have been very promising.

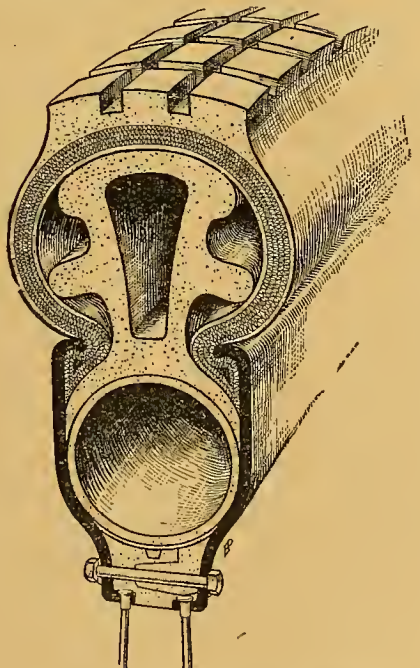
We illustrate here the type which is designed for motor cycles. It will be seen that it requires a special rim to accommodate it, and is a modification of one of the patterns suitable for cars.

The Pneumatic Principle Retained.

The pneumatic principle is retained, but the inner tube is considerably smaller, as compared with the cover size, than the ordinary air tube. Between the tube and cover lies the deflector, which is an endless band of rubber having spaces throughout its length containing air at atmospheric pressure.

The inner tube lies in the recess of the rim itself, and is therefore completely protected at the sides, while the depth of the deflector above it supplies a like protection against anything passing through the tread.

In actual tests on a car we learnt from experience that the heat usually generated by the use of puncture-proof bands and certain forms of tyre casings was non-existent with the Rapson tyre, and, provided there is no interference with the liveliness of the machine—a much more important point with the motor cycle than with the car—a great demand is bound to arise.

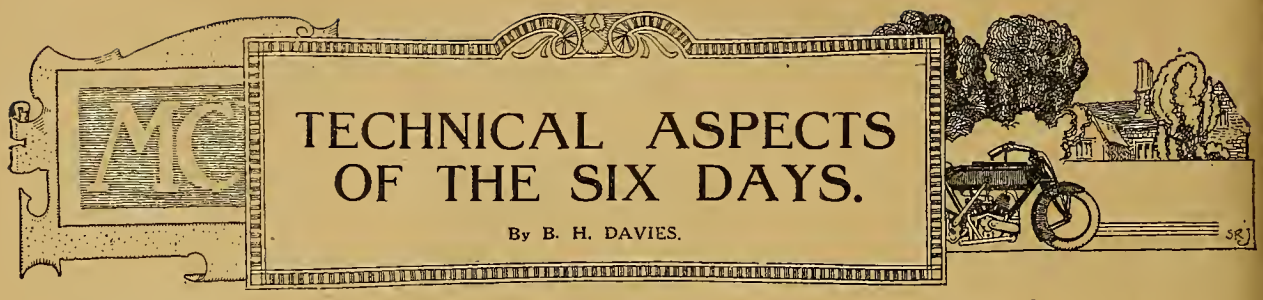


Sectional drawing of the new Rapson tyre for motor cycles.

The sole manufacturing rights for the United Kingdom have been secured by Messrs. Oylers, Ltd., 35, New Cavendish Street, London, W.1.

UNIFORM SIGNPOSTING IN FRANCE.

The French Government, according to a correspondent of the *Daily Mail*, is about to adopt a uniform scheme in connection with signposts and kilometre-posts. The department responsible, profiting by experience gained during the war, intends to replace all signposts by large metal plates bearing directions and distances in white letters on a blue ground, of sufficient size to be legible while travelling. Villages will also have the name posted in eight-inch letters on the police stations, post offices, and mayoral halls; this being a very useful innovation, as the motorist will agree, bearing in mind the complete ignorance as to whereabouts with which he passes through the intermediate villages on a road of which he only knows the terminal points. Our own national signposting might well be overhauled in the same efficient manner.



TECHNICAL ASPECTS OF THE SIX DAYS.

By B. H. DAVIES.

A Review of the Conditions and Regulations obtaining in this week's Trial.

IN one respect, and one only, the present Six Days Trial *is* disappointing. We all know that sundry revolutionary designers have thrown down the gauntlet to the pre-war motor cycle. Certain audacious 1919 machines, together with others which are still secret, have parted with most of the 1914 conventions. We hear of steel or aluminium cylinders, alloy pistons, overhead valves, spring frames, high horse-power from very small engine dimensions, sweeping reductions in weight, and other interesting innovations. Few of us have yet enjoyed a trial trip on any of these machines. In certain cases nobody has so much as seen the drawings or read the specification. The motor cycling public is thirsting for authentic information about these newcomers, and for the most part they are not here. This disappointment is inevitable. A rider who lives in a remote corner of the provinces can "size up the market" pretty accurately when three sources of information are open to him, viz.:

(1.) A trial run (prohibited at present by the special circumstances attending reconstruction). This tells him what the machine "feels like."

(2.) The results of the Tourist Trophy; cancelled this year owing to the switch over from war to peace. In normal years it tells us the speed and stamina of the different engines.

(3.) The Six Days, which tells us in what class each machine should be ranked, so far as its reliability and hill-climbing qualities are concerned.

This year we are unluckily deprived of two out of our three normal sources of information, while the event now proceeding will leave many burning questions unanswered. The fault, however, is not that of the A.C.U., which is going to provide much invaluable data for deciding our 1920 orders.

Finishing Condition.

The best feature of the whole trial is the close scrutiny of the condition in which the machines finish, which takes place on Saturday. The potential loss of *fifty* marks for any symptoms of excessive wear and tear comprises a quarter of the total which can be earned by the five days' riding, and are equal to the reliability marks, of which only fifty can be earned by a rider who is dead on time at every check. Compare this with "rememberable" trials in which several hundred marks were given for timekeeping, whereas the maximum penalty for finishing with a battered machine was a beggarly twenty-five points or so. Unless quality has improved past belief, we shall not be able to say this year, as was hinted in a byegone era, that the A.C.U. desires to give everybody a gold medal. In the most popular classes a machine has to earn 180 or 185 marks to secure its gold; if the "condition marks" are allotted with any stringency, no dud machine can snatch a cheap notoriety in this year's trial. I take it for granted that the inspection at the finish will be severe; in which case, this change in the marking would have reduced the gold medals to single figures, had it been applied seven or eight years ago.

Hill-climbing.

Of the remaining 100 marks thirty are being awarded for hill-climbing. To my mind these are the least interesting on the list. With the low bottom gear ratios which are now universal, there is no engine so bad that it cannot climb any "pleasure" hill. The test hills on the modern trials route seldom trouble an engine: they test the rider, and they are situated along such appalling roads that they impart a special meaning to the reliability marks, since most of the mechanical troubles of the week are caused by hard driving over difficult routes. But the climbing marks have lost their original significance.

Acceleration and Maintenance of Tune.

Forty of the remaining seventy marks are allotted at the rate of twenty for acceleration and twenty for keeping tune. Neither of these points are easily tested in respect of 114 machines in any manner which can interest the ordinary user. So far as acceleration goes, his wants are simple. Bang-smash acceleration of the Brooklands type has but limited interest for him; it is expensive and of little practical use. All he demands is an engine which will pick up without conking and without being too exacting about the setting of the carburetter levers. The A.C.U. will be puzzled to penalise these two common faults. Maintenance of tune is another matter altogether. From a practical standpoint it may be divided in ordinary riding experience into two categories. Every machine requires sundry routine attention, *e.g.*, decarbonisation, after a certain mileage. What is that mileage for each of the 114 entrants? Again, particular machines suffer from little periodic weaknesses from which others are wholly immune: *e.g.*, some two-strokes gum up their top piston rings rather quickly: some flat twins overlubricate the front cylinder so badly that it needs dismantling after 800 miles. Do any of the 114 entries suffer from these or similar peculiarities? We must wait and see what the second instalment of the consistency test discloses to-morrow, although it will probably stop short of telling us all we wish to know.

Thirty marks are left; they are evenly distributed between brakes, mudguards, and silence. Worthily so. We have no greater need than guards which

Technical Aspects of the Six Days.—

actually keep off the mud. Brakes are not yet perfect; I have a 1915 machine with a front brake which cannot help becoming noisy in 1,000 miles, and a back brake which is liable to fail me without any warning. Its 1919 stable companion has a front brake which sheds small parts, and a back brake which requires readjustment every time the tension of the rear chain is altered. Silence? "Mphm," as the Scots say. Personally, I hope the judges will reserve nine of the ten silence marks for mechanical silence, and use the odd mark to penalise any knut or greenhorn who fails to understand that 114 open exhausts would not popularise motor cycling in Llandrindod Wells.

Fuel Economy.

Over and above these obvious features, the judges "may record" half a day's consumption of petrol. I hope there will be marks for fuel economy next year. I admit the practical difficulties. I have run consumption trials myself, and, even with a small entry to manage, I would rather be a publican in the Rhonddha Valley on a weekly ration of one barrel of four half. I know, too, that a manufacturer might tune up his trial machines to 150 m.p.g. and deliver to the public machines capable of no more than 75 m.p.g. On the other hand, the manufacturers who take any serious interest in fuel economy are few and far between. Of my two machines, cited above, the consumptions in delivery tune were respectively 61 m.p.g. and 112 m.p.g.; both are of the same nominal h.p. I think stock machines would develop better economy if the trade had to fight once per annum to extract the last kick out of the juice used in a special machine in a premier event.

Lamps.

Furthermore, lamps were tested on Monday for the first time, though here the penalty is indirect, since lamp trouble will be registered under the "reliability" marking. This stunt will boost up the electric dynamo mightily, since few riders will trust to a single acetylene lamp and generator on such an occasion, whilst nobody dare start with two or three, and risk losing umpteen condition marks at the finish if some of them fell off.

An Imaginary Diary.

To show how very little may lower a sound, reliable machine to the bottom of the list under the severe marking instituted by the A.C.U., I have framed the following imaginary diary of an aspiring amateur on a first-class mount of 3½ h.p.

MONDAY.—Valve of acetylene generator shook loose and drowned my carbide; no reserve supply; twenty-four minutes late at night check.

TUESDAY.—Horsenail through back tube five minutes from lunch. Muffed repair; eleven minutes late at lunch.

WEDNESDAY.—Non-stop.

THURSDAY.—Non-stop except for a side-slip (no official looking).

FRIDAY.—Non-stop.

SATURDAY.—Docked five marks for too noisy a silencer, eight marks for poor show in brake test (I rode clumsily), five marks for loss of tune during week (carboned up through oil working past rings down so many steep hills), ten marks for duffing the patent consistency test, five marks for inefficient mudguarding, and twenty-eight marks for bad finishing condition (bent footrest, number-plate, and front guard in sideslip on the Thursday, scrapping when the rain was drying off after those beastly mountain roads; and they took off some for an oily crank case.

The imaginary rider whose tribulations are described above encounters no mechanical trouble of any sort or kind; is a good rider on freak hills and dangerous roads; storms up every selected precipice, but goes home without so much as a bronze medal, and his penalties, due to a trifling lack of experience and forethought, tot up to ninety-six marks. Two hundred minus ninety-six equal one hundred and four.

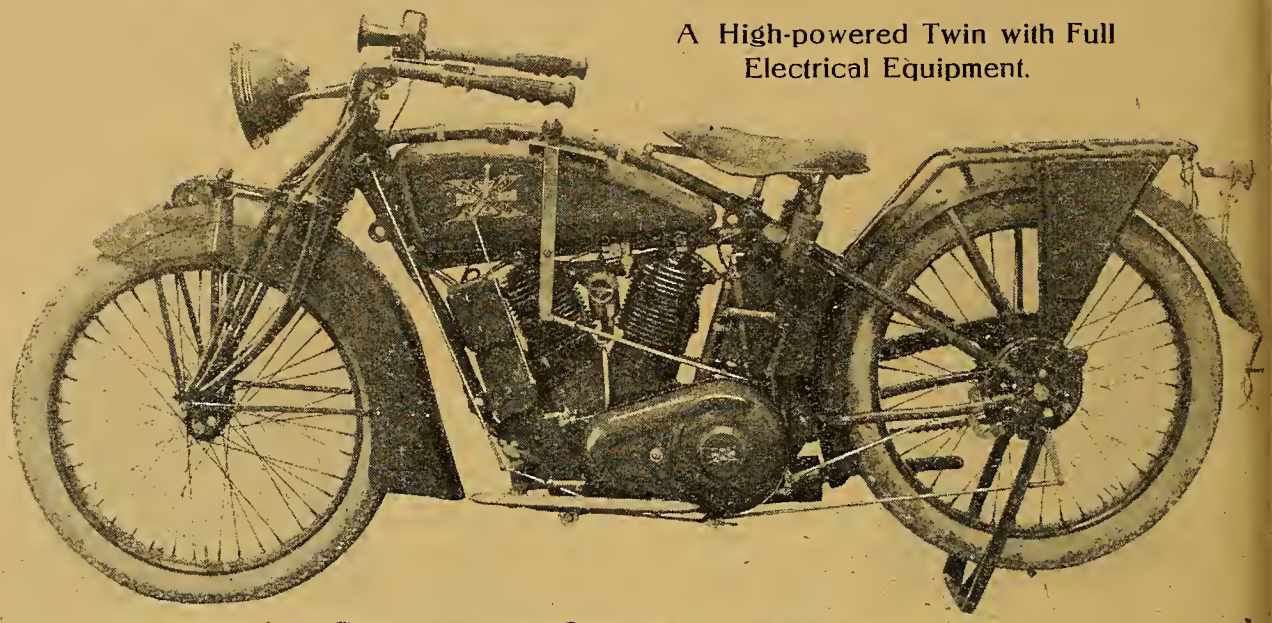
Administered in a fair but firm spirit, the 1919 regulations connot fail to differentiate quite sharply between machines of various grades of excellency. The Competitions Committee are to be heartily congratulated on the success of their deliberations.

STUDIES IN CORNERING AT SPEED.

Competitors rounding the hairpin bend on Sutton Bank, during a hill-climb held there by the York and District M.C. Observe the various styles of cornering adopted. The rider on the left appears to be quite at home, although his machine is leaning over at quite an acute angle.

THE LATEST AMERICAN EXCELSIOR.

A High-powered Twin with Full Electrical Equipment.



The latest model American Excelsior, fitted with an engine of 1,000 c.c

PRELIMINARY details of the Series 19 Excelsior have already appeared in these pages, but we recently had an opportunity of seeing the latest model at Mr. W. J. de Greeuw's new, but not quite completed, showrooms in Great Marlborough Street, London, W.1.

The Excelsior has a very attractive type of engine, with a cylinder capacity of 61in. (1,000 c.c.), a bore of 3-21/64in. (84.5 mm.), and a stroke of 3½in. (88.9 mm.).

The valve mechanism is extremely simple. There is only one large gear wheel with a cam on each side, of which the one on the outside comes in contact with two roller bearing rockers actuating the inlet valves, while the inner one does the same in the case of the exhaust valves. A large oil tank, which forms part of the accumulator case, is situated behind the saddle tube, and oil is delivered through a tap, which can be regulated to the oil pump, which maintains the correct level of oil in the crank case.

A novel feature is the system of priming the engine. There is a small needle pattern tap in a T union underneath the tank which communicates directly with pipes leading into each cylinder so that the priming can be effected with the utmost celerity.

The ignition and lighting are by the Midco electric system, consisting of a generator, transformer, and contact breaker, the whole being carried in the position usually occupied by the magneto. An interesting feature of the system is that there is a junction block for the insertion of a plug for an electric inspection lamp or for a sidecar lamp.

The usual type of motor cycle three-speed ball bearing gear box and a kick-starter are incorporated. The kick-starter is well designed, and allows of easy and instantaneous engagement, and it is coupled up to the exhaust lifter, which raises the valves and drops them at the correct moment.

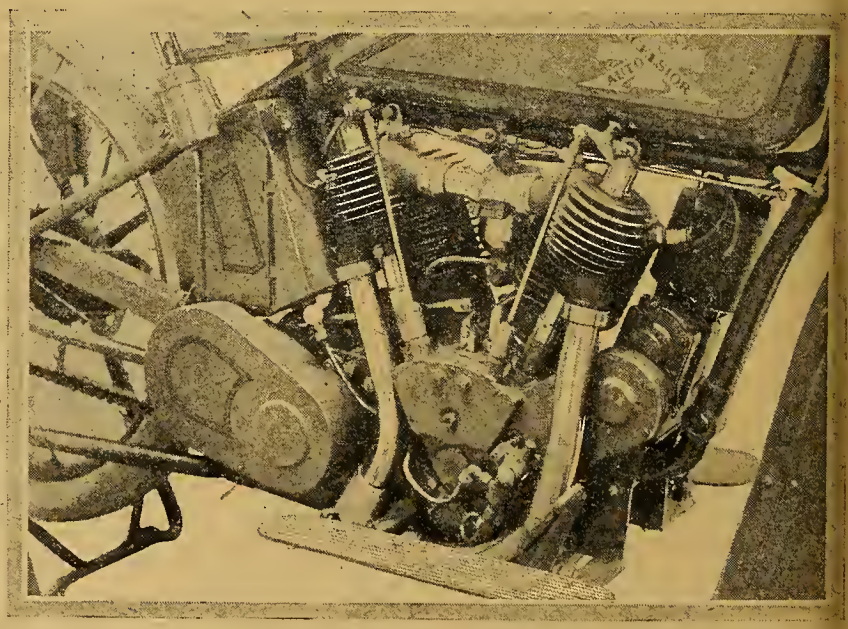
The makers of the Excelsior favour the dry type of multiple-disc clutch running on roller bearings, and the one fitted to this model contains two steel plates and three faced with Raybestos.

In the transmission arrangement the engine chain is on one side, and the final drive from the gear box to the rear wheel is on the other.

The clutch is actuated by a pedal, and also by the left twist grip on the handle-bar. An efficient transmission shock absorber of well-tried design is fitted.

It is claimed that the Excelsior frame was the first, and remains the only one, to be built of seamless tubing and nickel steel drop forgings throughout.

To enable the owner to get at the engine the auxiliary horizontal tube is made detachable, which is an extremely useful feature, and obviates the necessity of taking the engine from the frame to remove the cylinders.



Showing power unit assembly, and details of the Midco electric system, in use on the Excelsior

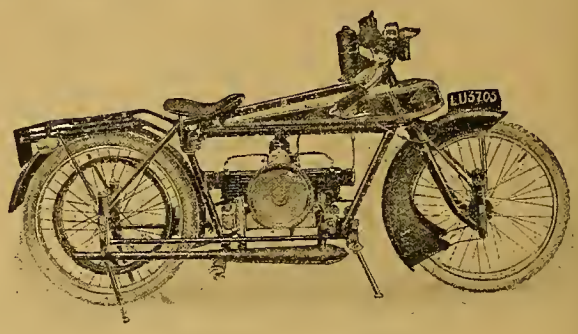
311 Miles per Gallon.

The result recently achieved on a

Wooler 2¾ Flat-Twin

is indeed excellent; but astonishing? By no means, when you carefully consider the many unique features embodied in this machine.

The closer you examine the Wooler, the less astonished you will be at its exceptional mileage per gallon.



Consider carefully the reasons for this ultra-economical running:

(1) The Induction System has been designed entirely to eliminate freezing. By reason of the mixture first passing through warm passages in the Crankcase the petrol becomes perfectly atomized The Super-heated Induction System we call it to emphasize the fact that freezing cannot occur.

(2) The correct design of the Valve Gear prevents leakage in this quarter

(3) The free running of the engine owing to the three ball bearings supporting the Crankshaft, and perfect workmanship throughout.

(4) The Infinitely Variable Gear, with 9 speeds enables the rider always to use the exactly suitable ratio.

(5) The frictionless running of the Gear, all stress being taken by ball bearings and ample ball thrust washers.

(6) Belt Drive absorbs less power than any other form of Transmission, but the belt must always be at the right tension to achieve this object.

The Wooler Rapid belt Adjusting Device (without use of tools) accomplishes this essential.

(7) The Wooler Spring Frame obviates all back wheel bounce.

Race Meeting in Sydney.

Over 18,000 people attended a motor race at Sydney recently, showing the keen public interest in motoring in Australia.

Fresh from the Country of Revolt.

L. A. Bees, who is riding an L.M.C. in the Six Days Trials, has only just returned from Russia, where he has been driving armoured cars.

Surplus Government Property.

The latest figures available of sales of surplus war material by the Disposal Board, Ministry of Munitions, show that £869,856 were secured for mechanical transport during August.

Liverpool M.C. Open Trial.

The Liverpool Club will hold an open trial on October 25th for the Reliance and many other cups, trophies, and medals. The trial will be in North Wales, and will cover about 165 miles and include petrol consumption, brake, acceleration, and flexibility tests. Further particulars may be obtained from Mr. E. N. Dean, 22, Lord Street, Liverpool.

M.C.C. Run to Exeter.

The Motor Cycling Club will hold their winter run to Exeter on Boxing night, and an announcement regarding the annual dinner will be made later.

Johannesburg to Durban Record Broken.

A wireless just received states that the record for the South African blue riband event—Johannesburg to Durban—has been broken by a rider of a Harley-Davidson, but details of the new time taken to cover the 420 miles that separate the two cities are not yet to hand

Motor Cycles as Prizes.

A motor cycle trial has been concluded to Norway from Christiania to Trondhjem and back to Christiania by the Norsk Motorcykkelklub and Ooslandske Petroleumskompani. The winners received new motor cycles as prizes, viz., a B.S.A., an Excelsior, a Reading Standard, an Indian, and a Harley-Davidson. Is this a sign of American penetration?

Mentioned in Despatches.

We learn that Maj. A. M. Low, R.A.F., D.S.C., has, for the second time, been mentioned in despatches, his name having been brought to the notice of the Secretary of State for valuable services rendered. At one time Maj. Low, the well-known two-stroke authority, and a contributor to these pages, had no fewer than fourteen of his patents actually in operation against the enemy at the Front.

TOURING ON A TANK.

Many readers who were for so long closely associated with all forms of tank warfare during the war will be interested in the little Renault tank shown touring in Switzerland. General Estienne, of the French Army, General Swabley, and Major Hyler are among the passengers.

Italian T.T.

Probably the most important race of the year in Italy was on the 7th inst. over the Cremona course, which was covered five times, totalling 195 miles. Seven competitors started in the 350 c.c. class, and twenty in the 500 c.c. class. The results were as follow:

350 c.c. CLASS.

		h.	m.	s.
1.	Pozzi (Motosacoche) ..	4	21	52⅕
2.	Baj. Badrico (Douglas) ..	4	29	17⅘
3.	Sassi (Maffeis)	4	34	0

Average speed of winner 44.85 m.p.h.

500 c.c. CLASS.

		h.	m.	s.
1.	Dovo (Della Ferrera) ...	3	32	34⅘
2.	Gnesa (Motosacoche) ...	3	58	52⅘
3.	Borogotti (Fougri) ...	3	59	59⅘

The average speed of winner was 55.25 m.p.h.

Official Results of the M.C.C. Team Trial.

We are now enabled to give the official results of the team trial for *The Motor Cycle* challenge cup.

As previously announced, the trophy was awarded to the Coventry and Warwickshire M.C., each competitor in which gets the M.C.C. gold medal. This was the only team to finish complete—S. Wright (3½ Humber), R. B. Ewens (3½ Rudge-Multi), W. Brandish jun. (5-6 Rover), F. G. Edmond (4 Triumph sc.), H. A. Finch (4 Triumph), and B. Ryecroft (4 Triumph). No other team made a full score on mileage, but the following list shows the records of the other teams:

2. ILKLEY M.C. AND L.C.C.—J. E. Walker, W. Moore, W. L. Guy, H. W. Sellers, and W. F. Scott (all rode 3¾ Scotts). 524½ miles. (Each member was awarded an M.C.C. silver medal, as the team rode most consistently.)
3. THE MOTOR CYCLING CLUB.—E. A. Bridgman (7 Indian sc.), P. W. Moffat (4 Douglas), B. A. Hill (8 Morgan), R. B. Clark (2¾ Douglas), and F. J. Watson (6 Ariel). 506 miles.
4. WOOLWICH, PLUMSTEAD, AND DISTRICT M.C.C.—T. J. Ross (4 Triumph), J. D. Hardee (8 Matchless sc.), R. Boxer (4 Triumph), F. J. Ellis (8 Matchless sc.), and B. J. Sims (4 Triumph). 492 miles.
5. SHEFFIELD AND HALLAMSHIRE M.C.C.—A. B. Chapman (3½ Brough), D. Kaye (4 Triumph), H. Reynolds (4¼ B.S.A.), and S. Sawer (4 Norton sc.) 451 miles.
6. ESSEX M.C.—E. A. Colliver (7 Indian sc.), S. R. Axford (8 Sunbeam sc.), and F. W. Applebee (4½ B.S.A.). 433½ miles.
7. LIVERPOOL M.C.—R. J. Mundy (8 Matchless), V. E. Horsman (4 Norton), S. Parker, and N. H. Brown (7 Indian sc.). 413 miles.
8. CAMBERLEY AND DISTRICT M.C.C.—W. K. Alfold (3½ Ariel), H. T. Whitty (6 Ariel sc.), and F. Baker (8 Matchless sc.). 370 miles.
9. SOUTH BIRMINGHAM.—B. Kershaw (2½ Verus), and G. Dalby (4 Triumph sc.). 347½ miles.
10. PUBLIC SCHOOLS M.C.C.—J. A. Watson-Bourne (4 Blackburne), and E. M. P. Boileau (8-10 Henderson). 317½ miles.
11. EALING AND DISTRICT M.C.C.—F. A. Longman (7 Harley sc.), and S. E. Longman (4 Triumph). 297½ miles.
12. MIDDLESEX M.C.C.—J. Hilyer (3½ Rover). 215 miles.
13. EASTBOURNE AND DISTRICT M.C.C.—J. Blakemarsh (3½ Norton). 140 miles.

The Motor Cycling Club desires to thank the many willing helpers who gave their valuable services during the trial, and especially mentions the names of Messrs. W. H. Wells, R. C. Davis, Capt. R. C. Charlesworth, and Major Chater-Lea.

Awards in the Circuit de l'Eure.

It is interesting to British motor cyclists and manufacturers to know the value of the prizes won in the important French race Le Circuit de l'Eure. Louis, winner of the 250 c.c. class, takes altogether in money £15, and the M.C.F. gold medal, and a silver medal presented by "Motocyclisme." Milland, first in the 350 c.c. class, takes £11 and gold and silver medals. Péan, who won the 500 c.c. class, gains £17, two gold, and one silver medal. Huret, winner of the sidecar 750 c.c. class, gains £25, one gold, and one silver medal. Houel, £25, one gold and one silver medal.

HP?

There has been a veritable scramble for the distinction of having the first number registered with the new index letters allocated to the city of Coventry. These are HP, and several local owners of Triumphs have been as keen to obtain HP 4 as the dozens of car and motor cycle owners have been to obtain HP 1 or HP 3, HP 10, HP 11, HP 12, HP 15, according to the power of their car or cycle. The Chief Constable, however, decided that the numbers should be granted automatically, with the result that Mr. Fulford of sidecar fame has HP 1 for his 11 h.p. Hillman car, while HP 2 goes to a Scott owned by a member of the staff.

Imports and Exports.

Considering that the restrictions on the importation of motor cycles were not removed until September, it may cause a surprise to some to find that 166 machines arrived during August, valued at £10,641. This fact, however, is of little importance, for these increased figures are forerunners of the more formidable quantities that are soon to reach these shores.

The value of imported tyres, parts, and accessories amounted to £9,590.

EXPORTS.

In August our exports were maintained at a moderate level, their value being nearly double that of the corresponding month last year.

	1917.	1918.	1919.
Number of motor cycles exported..	1,263	475	849
Value of motor cycles and accessories	£105,383	£55,868	£109,984

14,744,369 gallons of petrol were imported into the country during August, this amount being a very slight increase on the July figures.

British Machines in Italy.

Several British machines were used by competitors in a hill-climb at Como (Italy) on the 24th August; the hill is called in a French newspaper Come-Brunate. The results were: 750 c.c. Class.—First, Grignani (Fongri), speed 24¾ m.p h.; second, Pietrasanto (Tar); third, Galluri (Ariel). 500 c.c.—First, Bordino (Motosacoche), speed 25 m.p.h.; second, Marcoli; third, Capitani (Triumph). Frera, Fongri, and Triumph machines were fourth, fifth, and sixth in order named. The 350 c.c. class was won by a Frera, speed 19 m.p.h., the second machine being a Douglas. In the sidecar class (1,000 c.c.), the winning machine was a Sun, followed by a Frera. The hill is 3.16 miles in length with an average gradient of 1 in 7½.

A Dangerous Game.

We have lately received several long lists of motor registration numbers, evidently compiled by children and forwarded in the expectation of receiving some award for the fruits of their misdirected energies. We regret to disappoint the youngsters, but the responsibility for any competition involving the noting of numbers on passing motor cycles and cars is not ours.

Recently in many rural districts we have noticed parties of children armed with paper and pencil, and seen, too, that their pastime has often brought them into danger through running into the road without noticing that other vehicles were following the one whose number they were intent on taking.

The Institution of Automobile Engineers.

The first meeting of the session of the Institution of Automobile Engineers will be held on Wednesday, October 1st, at the Royal Society of Arts, John Street, Adelphi, W.C., at 8 p.m., when Mr. Thomas Clarkson, M.Inst.C.E., will deliver his presidential address. Mr. Clarkson will also deliver his address to the Midland Centre on the following night, Thursday, October 2nd, at the White Horse Hotel, Congreve Street, Birmingham, at 7.30 p.m. A card of invitation to either meeting may be had on application to the secretary of the Institution of Automobile Engineers, 28, Victoria Street, London, S.W.1.

The following list of papers has been promised to the Institution for the forthcoming session. Those members who desire to have a copy of any paper in advance of the meeting, with a view to taking part in the discussion, should notify the secretary without delay. It is hoped to have copies ready two or three weeks before the paper is actually read so as to give time for members to prepare their remarks: Presidential address, by Mr. Thos. Clarkson; "Valve Failures in Petrol Engines," by Dr. L. Aitchison; "Car Design and Car Usage considered from the Standpoint of the Majority of Owner-drivers," by Mr. E. N. Duffield; "Producer Gas as applied to Vehicle Propulsion," by Lt.-Col. D. J. Smith; "Cast Iron in Relation to the Automobile Industry," by Mr. J. E. Hurst; "Some Experiments on Supercharging for High-speed Engines," by Mr. H. R. Ricardo; "Air-cooling of Engines," by Dr. A. H. Gibson; "Gear Cutting," by Mr. P. J. Worsley; "Inertia Torque in Crankshafts," by Mr. F. A. S. Acres; "The Final Drive of the Motor Cycle," by Mr. E. Candwell; "The Process of Ignition," by Mr. A. P. Young and Mr. H. Warren; "Steel Tubes—Their Manipulation and Use in Construction," by Mr. W. W. Hackett; "Volatile Fuel Supplies," by Dr. W. R. Ormandy; "The Single-cylinder Motor Cycle Engine," by Mr. N. W. Bowkett; "American Practice," by Mr. A. Ludlow Clayden.

Road Signals.

A committee appointed by the Commissioner of the Police of the Metropolis has suggested that the following code of signals be used by drivers of motor and horse vehicles.

There is much diversity of opinion, even amongst experienced drivers, as to what are the correct signals to indicate to other drivers the intended movements of the vehicle, and great advantages would accrue were signals standardised.

All signals to be given on the right-hand side of car and in ample time to be of use.
Right forearm vertical—stop.
Right arm horizontal—turning to right.
Right arm horizontal and then swept to left—turning to left.
Right arm horizontal, palm of hand down, and moved slowly up and down—slow down.
Right arm waved low from rear to the front—pass

FOR HORSE DRIVERS.

Whip rotated above head—turning
Whip raised vertically—stop.

It is obvious that one code only is possible owing to the confusion that would arise were duplicate signals admissible.

THE SCOOTER IN COMPETITION.

O. G. Benson making a good climb on an Autoglider at the York and District M.C. Hill-climb at Sutton Bank.

The Luton and South Beds. A.C. Open Speed Trial.

QUITE a successful meeting was held on Saturday last by the Luton and South Bedfordshire Automobile Club in Luton Hoo Park, by kind permission of Lady Wernher.

The weather was fine on the whole, but dull and rather cool. Among the competing machines we noticed the new Duzmo recently described in these pages. It had bad luck in its first run, and sheared a pulley key. There was a Reading Standard there, the American motor bicycle which conforms most closely to English ideas, and the latest type A.B.C., to which a few refinements have been added. (These machines did not compete.) Other interesting mounts were the M.A.G.-engined Matchless machines, and two Douglases with overhead valves, one of which was ridden by Kickham.

The following are the results:

EVENT 1.—EXPERT AND GENERAL (CLASS 1) UP TO 275 C.C.—(1) G. J. McIntosh (Singer, 274 c.c.), time 23⅘s. = 47.01 m.p.h.; (2) W. A. Jacobs (Singer, 248 c.c.), 25s.

EVENT 2.—EXPERT AND GENERAL (CLASS 3) UP TO 500 C.C.—1, H. Le Vack (Edmund M.A.G., 496 c.c.), time 20s. = 55.94 m.p.h.; (2) H. H. Beach (Norton, 490 c.c.), 20⅘s.

EVENT 3.—EXPERTS BARRED (CLASS 1) UP TO 275 C.C.—(1) G. J. McIntosh (Singer, 274 c.c.), time 24s. = 46.62 m.p.h.; (2) W. A. Jacobs (Singer, 248 c.c.), 25s.; (3) T. Eve (Martio, 245 c.c.), 38s.

EVENT 4.—EXPERT BARRED (CLASS 3), UP TO 500 C.C.—(1) H. Martio (Matchless, 482 c.c.), time 19⅘s. = 57.68 m.p.h.; (2) H. Le Vack (Edmund M.A.G., 496 c.c.), 20s.

EVENT 5.—EXPERT AND GENERAL (CLASS 2), UP TO 350 C.C.—(1) E. Kickham (Douglas 350 c.c.), time 20⅘s. = 53.79 m.p.h.; (2) A. E. Wills (Douglas 350 c.c.), 22⅘s.

EVENT 6.—EXPERT BARRED (CLASS 4), UP TO 750 C.C.—(1) H. Martin (Matchless, 482 c.c.), time 19s. = *58.88 m.p.h.; (2) H. Le Vack (Edmund M.A.G., 496 c.c.) 19⅘s. *Fastest machine up to 500 c.c.

EVENT 7.—EXPERT BARRED (CLASS 2), UP TO 350 C.C.—(1) A. E. Wills (Douglas, 350 c.c.), time 23s. = 48.64 m.p.h.; (2) G. J. McIntosh (Singer 274 c.c.), 23⅘s.

EVENT 8.—EXPERT AND GENERAL (CLASS 10) CYCLE CAR, THREE-WHEEL.—(1) S. Hall (Morgan 1,090 c.c.), time 31s. = 36.09 m.p.h. (walk over).

EVENT 9.—EXPERT BARRED (CLASS 10), CYCLE CAR, THREE-WHEEL.—Lt. S. Cox (Morgan 1,100 c.c.) time 29⅘s. = 37.8 m.p.h. (walk over).

EVENT 10 (CLASS 6).—MOTOR CYCLE WITH ENGINE NOT EXCEEDING 275 C.C., WHEELS NOT EXCEEDING 20IN.—O. G. Beoson (Autoglider 269 c.c.) time 34⅘s.

EVENT 11.—EXPERT AND GENERAL (CLASS 4), UP TO 750 C.C. (1) H. Le Vack (Edmund M.A.G., 496 c.c.), time 19⅘s. = 56.5 m.p.h. (2) H. Martin (Matchless, 482 c.c.), 20s.

EVENT 12.—EXPERT BARRED (CLASS 5), UP TO 1,000 C.C.—(1) E. Baragwanath (Zenith, 984 c.c.), time 16⅘s. = 66.61 m.p.h.; (2) F. A. Wheeler (J.A.P., 998 c.c., 17⅘s.

EVENT 13.—EXPERT AND GENERAL (CLASS 7), SIDECARS UP TO 500 C.C.—(1) H. Le Vack (Edmund M.A.G., 496 c.c.), time 23s. = 48.64 m.p.h.; (2) D. R. O'Donovan (Norton 490 c.c.) 24⅘s.

EVENT 14.—EXPERT AND GENERAL (CLASS 9), ANY MACHINE UP TO 1,000 C.C.—(1) E. Baragwanath (Zenith, 984 c.c.), time 16⅘s. = *66.61 m.p.h.; (2) F. A. Wheeler (J.A.P., 998 c.c.), 17⅘s. = 63.7† m.p.h.

*Fastest time of the day, and twice accomplished by this rider. †Second fastest time.

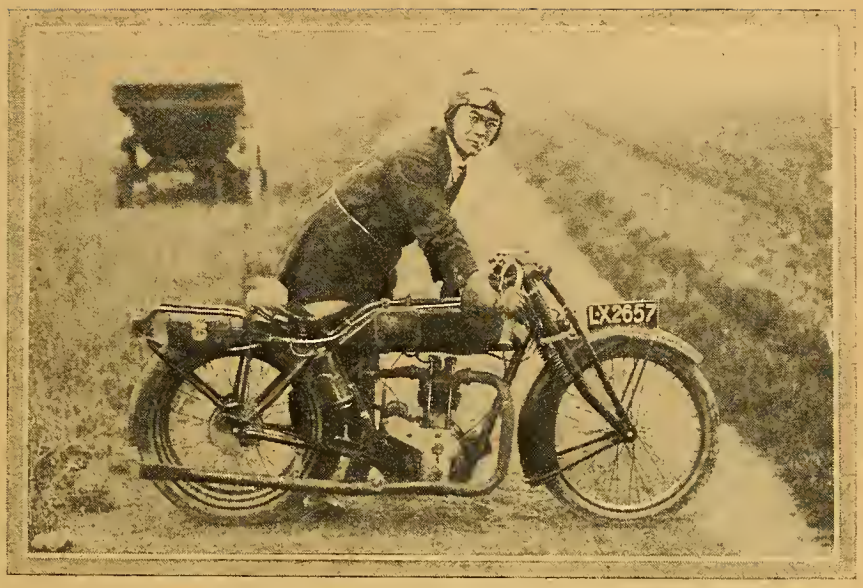
EVENT 15.—EXPERT BARRED (CLASS 7), SIDECARS UP TO 500 C.C.—(1) H. Le Vack (Edmund M.A.G.), 496 c.c.), time 22⅘s. = 49.51 m.p.h.; (2) N. Albon (Rover, 499 c.c.), 27⅘s.

EVENT 16.—EXPERT BARRED (CLASS 8), SIDECARS UP TO 750 C.C.—(1) H. Le Vack (Edmund M.A.G. 496 c.c.), time 23⅘s. = 48.22 m.p.h., and E. Swain (Indian 685 c.c.), 23⅘s. = 48.22 m.p.h.

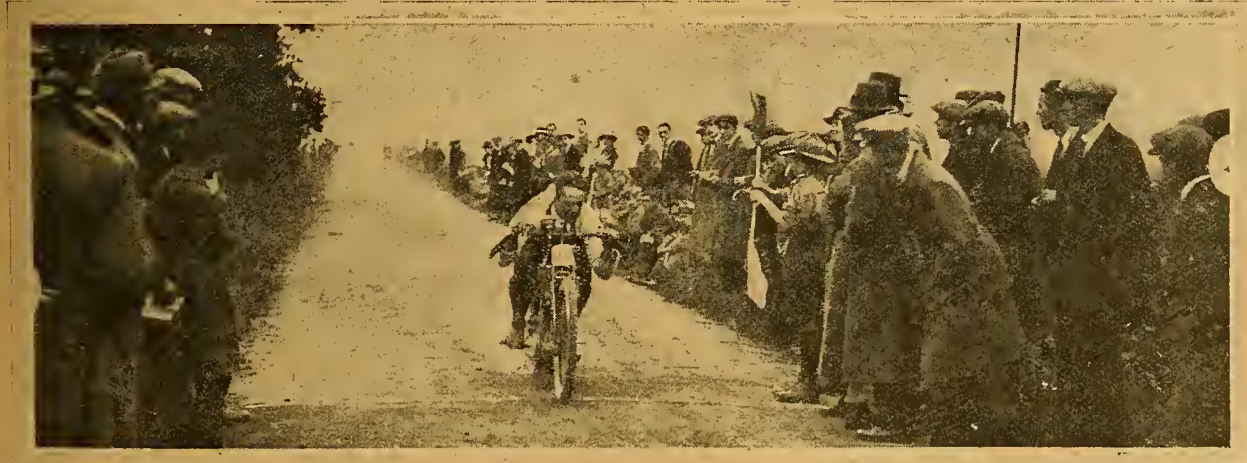
EVENT 17.—EXPERT AND GENERAL (CLASS 9), SIDECARS UP TO 1,000 C.C.—(1) E. C. Baragwanath (Zenith, 984 c.c.), time 20⅘s. = 54.31 m.p.h.; (2) W. J. Barker (Henderson, 998 c.c.), 23⅘s.

EVENT 18.—EXPERT AND GENERAL (CLASS 8), SIDECARS UP TO 750 C.C.—(1) H. Le Vack (Edmund M.A.G. 496 c.c.) (walk over).

EVENT 19.—EXPERT BARRED (CLASS 9), SIDECARS UP TO 1,000 C.C.—(1) E. C. Baragwanath (Zenith, 984 c.c.), time 21s. = 53.28 m.p.h.; (2) H. A. Reyre (Zenith, 998 c.c.), 25s.; (3) C. G. Stokes (Harley-Davidson, 998 c.c.), 25⅘s



The 3½ h.p. Duzmo, a recent addition to the popular single-cylinder class Ridden in the Luton Hoo speed trials by J. Wallace

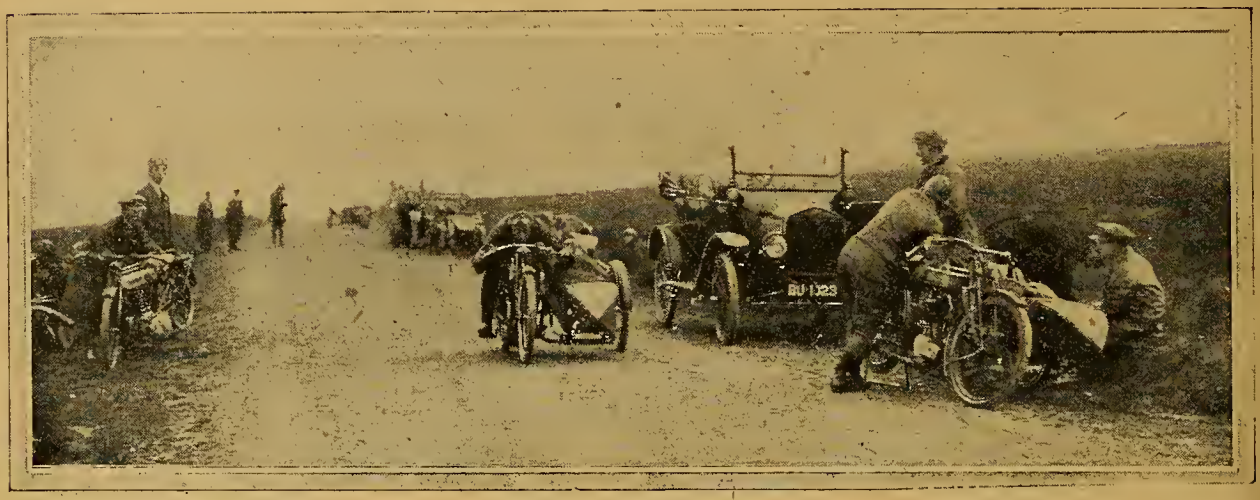


G. W. Wallace (3½ h.p. Norton) passing the timekeeper at the speed trials on Saturday

The Luton and South Beds. A.C. Open Speed Trial. –

A feature of the meeting was the triumph of Le Vack's M.A.G.-engined Edmund, which won four events and was second in two, and the success of Baragwanath's Zenith, who has had many wins to his credit, and was first in four events. We were also pleased to note that the fine old veteran, Harry Martin, had lost none of his former skill. Mr. T. D. Dutton was the timekeeper, and the times at the start (flying) were taken by the buzzer on the field telephone, which worked admirably.

Manchester M.C. Speed Trials.



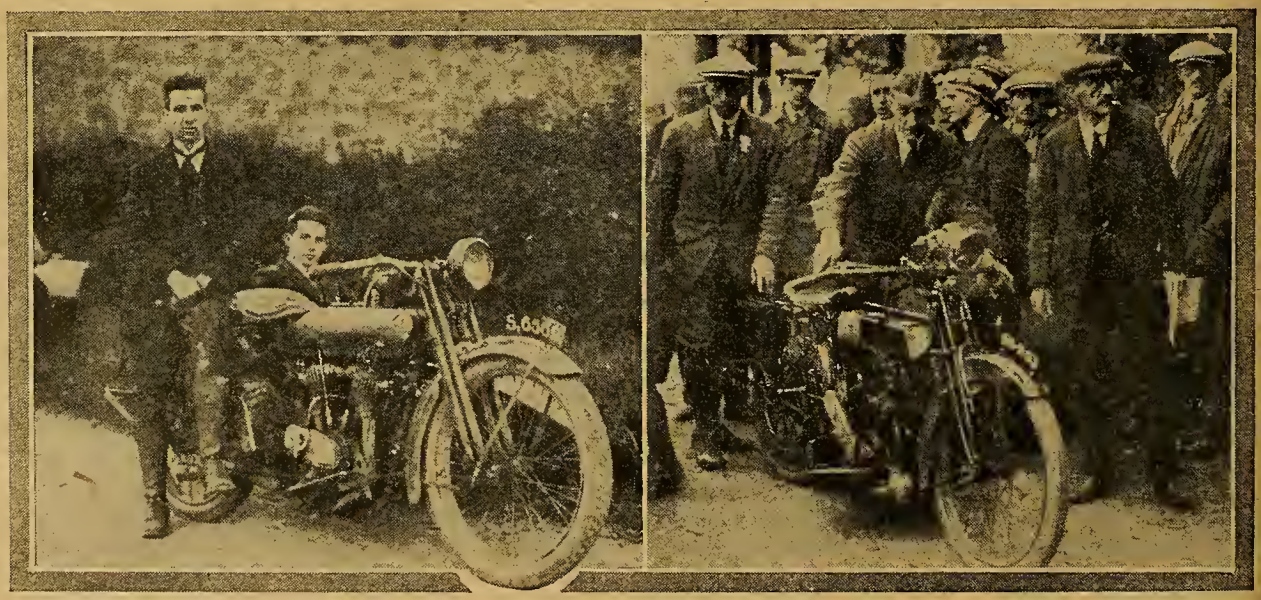
A scene at the Manchester M.C. speed trials J. Smith (Triumph sc.) has just passed the starting line

THE course selected by the Manchester M.C. for its speed trials on September 14th was a well chosen straight two-mile stretch of road over the moors, known as "Bill-o'-Jacks," Greenfield, on the borders of Lancashire and Yorkshire. A following wind prevailed, and, with a half-mile start and ample space in which to pull up, some good riding was accomplished.

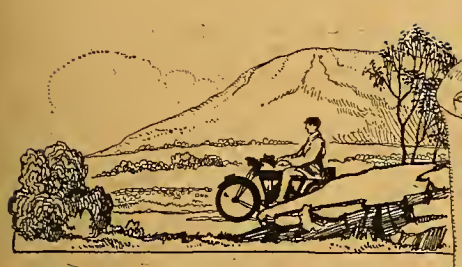
As is frequently the case up North, entries were confined rather largely to pre-war models, and the lack of new machines has seriously handicapped club developments.

Many well-known local riders competed in the two unlimited classes for solo and sidecar machines respectively, and amongst those who achieved exceptionally fast times were P. Platt (3½ Norton), J. Smith (Triumph sc.), W. Bottoms (6 Bradbury sc.), and N. Taylor (who also rode a 6 Bradbury).

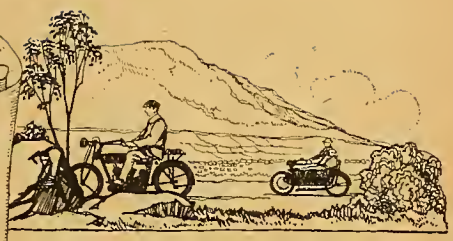
The weather throughout the event was dull and cold, but in no way interfered with the progress of the competition. Results will be entirely decided on A.C.U. formula, and are not available at the moment, but will be announced in due course.



There was a record entry in the Western M.C. (Glasgow) Hill-climb, on Garshake, on Saturday last. Geo. Grinton (7-9 h.p. Harley-Davidson sc.) made fastest time of the day in the sidecar class, while McCullach (3½ h.p. James twin) won the event for solo machines up to 600 cc., being awarded the MacLean Cup for the best performance of the day.



THE A.C.U. SIX DAYS RELIABILITY TRIAL



A Representative Range of Competing Motor Cycles, mostly British, but including Specimens from America and France.

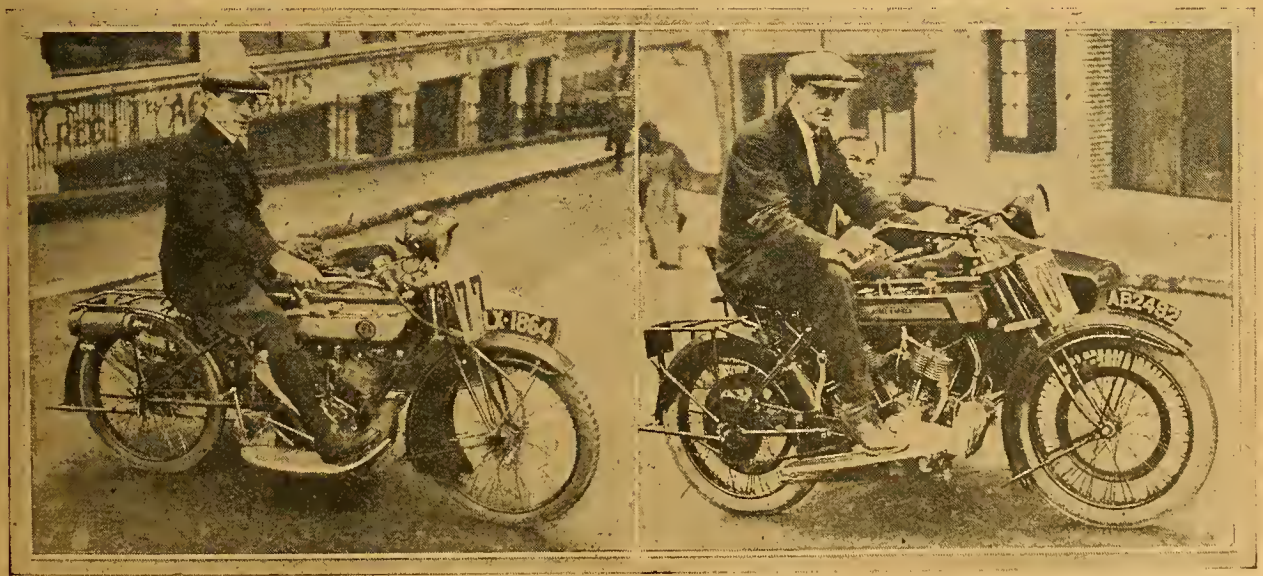
Entries include 65 Solo Machines, 44 Sidecars, and 6 Runabouts; 41 Single and 24 Twin-cyl. Solo; 9 Single and 35 Twin-multi Sidecars.

LLANDRINDOD WELLS this week is the Mecca of all enthusiastic motor cyclists, and those manufacturers who follow with close interest the performances of their own as well as rival manufacturers' machines. The splendid entry of 115 machines is thoroughly deserved by the Auto Cycle Union, for none will deny that the governing body's events are always well arranged and splendidly organised, which, of course, is as it should be. British-made machines naturally predominate. One wishes that Italian and Belgian machines could have figured among the lists to give the event a more international character. As it is, the solitary entry of a G.L. machine represents France, whilst the reputation of the United States is being worthily upheld by the Harley-Davidson, Indian, and Henderson.

All Roads lead to Llandrindod.

Competitors converged on the popular Central Wales resort from all corners of the British Isles, mostly, be it said to their credit, by road, though many journeyed by rail. And what weather it was to welcome them. Pouring rain, greasy roads, and the surrounding hills obscured by rain clouds. Many broke their journey on Saturday evening at Leominster, Kington, and Penybont, and rode in on Sunday morning. Consequently, the scene at Mr. Tom Norton's garage at Llandrindod was an extremely busy one throughout Sunday, most riders finding plenty of finishing touches needful; others adjustments far more ambitious. De-la-Hay whipped his cylinder off just to make sure all was well; whilst a Douglas rider removed the rear portion of his frame. Spindles, too, which had, apparently, already found the wet, were removed for examination.

Given wet weather for two or three days during the trial, much new and useful light will be shed upon the design of weatherproof hubs. Even on Sunday not every rider was a sure starter, strange it is how ill luck dodges some riders. The 1920 Levis, for instance, entered by Messrs. Butterfield's, P. Pike riding, suffered trouble with its sloping tank of new design near Radnor When we passed him he had not diagnosed the complaint, but it was found later to be due to the oil sump joint having sprung and allowed a too thorough admixture of petrol and oil, which the engine did not like. Of course, Levis engines have a proper lubrication system, and the additional supply due to the leaky tank was most unfortunate. Not to be outdone, however, a 1919 machine was telephoned for, and in case of that failing to arrive in time, a two-gallon petrol tin was to be affixed to the carrier of the 1920 mount, and a start made.

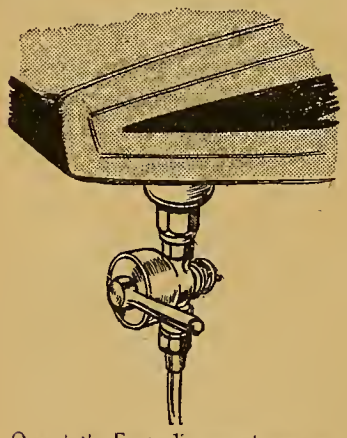


France's only representative, the G. L., ridden by F. Thorp
The sidecar carried two spare wheels at the rear.

The 8 h.p. Enfield Colonial Model with 28 × 3in. wheels, high ground clearance, and three-gallon tank.

Cleaning up after a wet and muddy run to Llandrindod. The new 8 h.p. Dot-Jap machines ridden by H. Reed and J. H. Place

Due to the muddy state of the roads, there was much hosepipe in use at the week-end, in itself a point worthy of notice, for it is only in recent years that such complicated mechanism as a motor cycle necessarily possesses could be sprayed with water with impunity, lest mysterious short-circuits should be set up. Nowadays, entirely waterproof mag-



One of the Enots disc petrol taps on A. Sumner's Zenith

netos have disposed of all fears on this score. The state of some machines, however, shows that there is still room for improvement in respect of mudguarding.

Observations on the Course

Of course, rumours were rife at the start as to the unexpected severity of the hills and road surfaces. Not all are agreed as to which day constitutes the most arduous trial, though the majority considered Wednesday's programme, with Bwlch-y-Groes and other lesser known but equally difficult ascents, the severest. Of tricky bends approaching single figure gradients there are an abundance. Of course, the water-splashes included have been exaggerated into roaring mountain torrents.

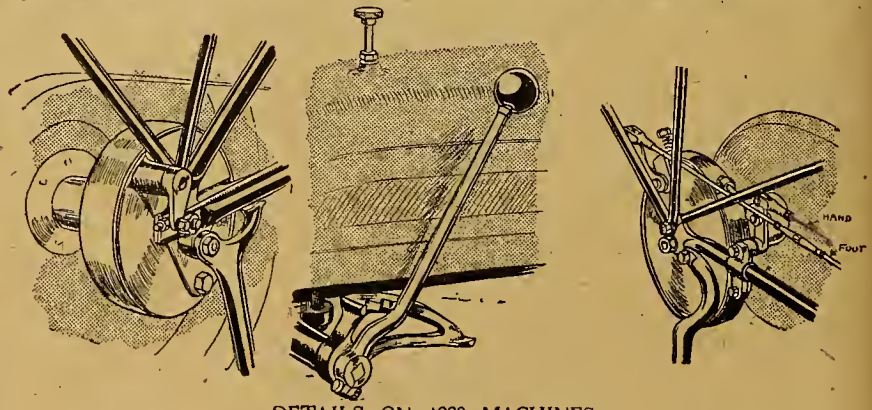
In conversation with Mr. T. W. Loughborough, the hard-working secretary of the A.C.U., we learned that under certain weather conditions which obtained during the week-end some of the mountain passes are likely to be so entirely enveloped in rain clouds as to equal a thick November fog, in which case a 20 m.p.h. average would be impossible or, at any rate, dangerous. Should such conditions prevail, the judges will have to consider the question of allowing an extension of time. In this connection we well recall an ascent of Bwlch-y-Groes (The Pass of the Cross) from Dinas Mawddwy in pouring rain, when it was difficult to see twenty yards ahead owing to the mist, and the sheer descent of several hundred feet by the roadside was a not too comforting prospect.

There are three 3½ h.p. sidecars (a B.S.A. is notable for the lowest gear ratio of 21 to 1) and several 4 h.p. single-cylinder sidecars in the event, including Norton, Triumph, B.S.A., and James. Their final performances will be most interesting to watch, for the greatest credit will be due to any rider who succeeds in piloting such a machine safely home, in view of the conditions. Much mystery surrounds the new Triumphs.

A. Sumner on the new countershaft Zenith; the kick-starter is in a higher position than usual.

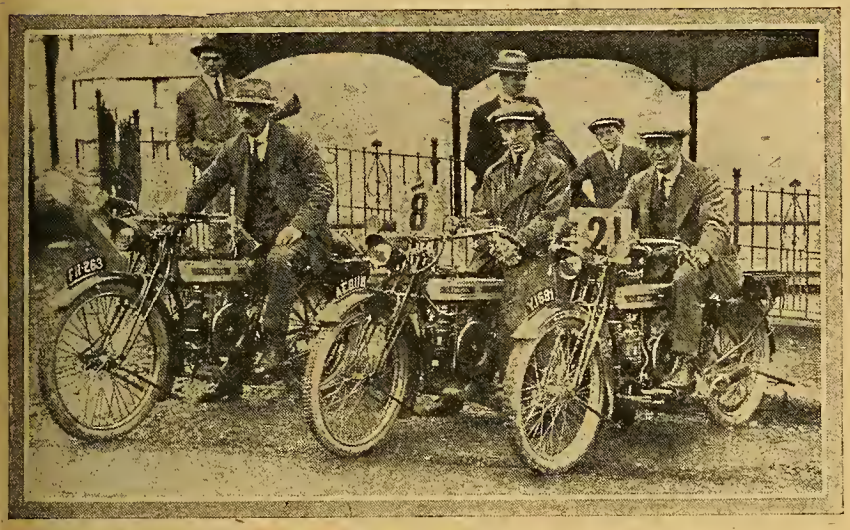
There are two entered with all-chain drive, Triumph three-speed countershaft gears, with a new form of change speed by a neat quadrant on a bracket supported by the tank tube, and, of course, the new Triumph enclosed fork springs. The mystery is in the engine, for it is said that G. E. Stanley has been at work, and the engines are quite the hottest 550 c.c. motors ever produced. Their performance already is quite an eye-opener.

The lamp test worried many competitors; dynamos are fairly common on the



DETAILS ON 1920 MACHINES.

The internal expanding brake on H. Reed's new 8 h.p. Dot. The neat quadrant on G. Shemans's chain-driven Triumph. Rear brakes of T. Stevens's 4¼ h.p. James. Ferodo-lined internal expanding and external contracting.



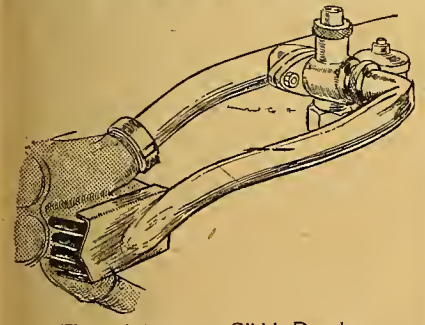
The Douglas team : P. W. Moffat (3½ h.p. spring frame), W. B. Gibb (2¾ h.p.), and F. G. Ball (2¾ h.p.)

machines; some have D.A. (dissolved acetylene) cylinders, but the majority have pinned their faith to the old reliable generator and lamp mounted on the handle-bar bracket.

E. A. Colliver's Indian is in itself in perfect order, but a crack developed in the carbon brush holder of the magneto, and a temporary repair was effected just before the start, with shellac and rubber solution, which, it is hoped, will hold out.

Tyres are frequently 28 × 3 inches; most sidecars are equipped with this size, Palmer cords being particularly prominent.

Stevens's single-cylinder James sidecar has three brakes, the usual front rim brake, an external contracting brake

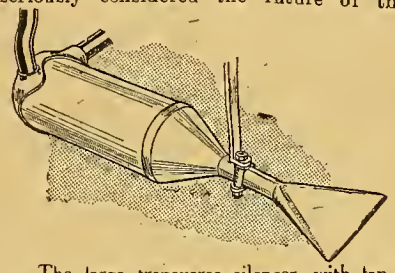


Warm air intake on Gibb's Douglas.

on the rear wheel operated by a Bowden handle-bar lever, and an internal brake operating on the same drum, but foot-operated. A New Imperial outfit also has an additional rear wheel brake. The Sunbeams, to outward appearance, are standard machines in every particular. The G.L. footplates, shaped to form a screen for rider's legs by covering in the whole of the space between power unit and footrest, are a commendable feature. C. Sweerts, brother of G. Sweerts, of Paris, well-known in pre-war days, is Thorp's passenger on this French production, largely composed of British standard fittings. It is noticeable that a number of competitors have dispensed with the rear chain guard, evidently in order to simplify repairs should adjustments prove necessary. We were glad to see that due attention had been paid to the question of easily effected chain adjustments. The Scotts buzz around as usual, but again we notice a lack of unanimity in the question of the most suitable form of lubricator. Harry Reed's workmanlike Dot-Jap sidecars have already won much favourable comment; they may be expected to finish well. Two non-competing machines engaged on the trial and worthy of mention are a new Morgan, with a twin Blackburne engine, and W. H. Egginton's 8 h.p. Sunbeam, with one of the only two V type engines of Sunbeam manufacture in existence. The latter mount, which is highly spoken of by its owner, has a Lucas Magdyno outfit.

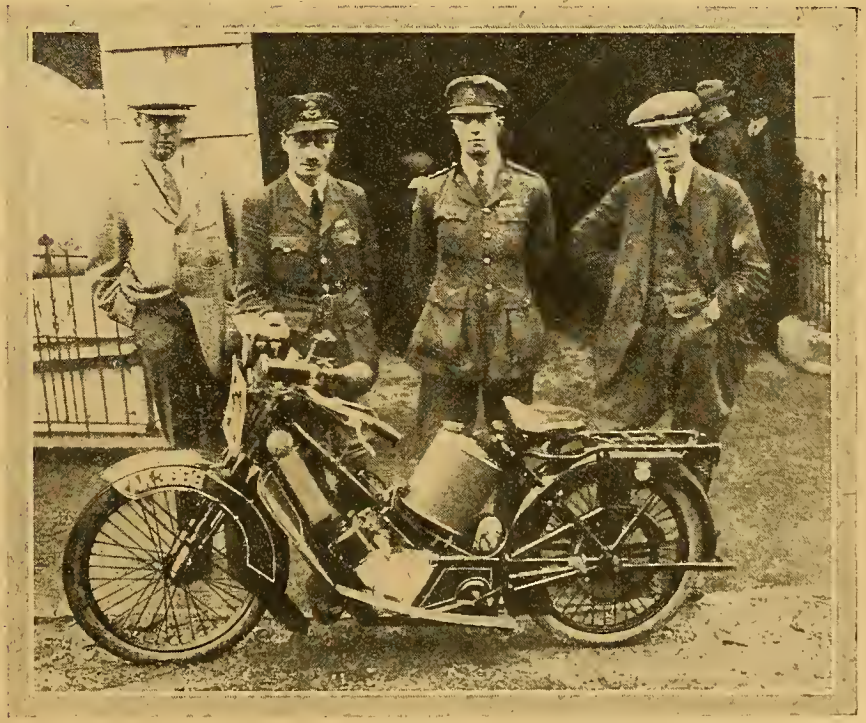
Overseas Conditions.

The Enfield Co. are wise in having entered their Colonial model sidecars, for unquestionably the A.C.U. have seriously considered the future of the



The large transverse silencer, with tan tail extending under the sidecar of Creak Davis's Chater-Lea.

motor cycle industry in introducing so many overseas conditions into the trial. 8 h.p. engines, three-gallon tanks, dynamo outfits, and a ground clearance of seven and a half inches are features of the excellent design of the Enfield mounts. A twin Zenith which is being ridden by A. V. Sumner has the kick starter mounted higher and more conveniently than formerly. Modern belts being made of really durable material, this machine may confidently be expected to do well. We were sorry to notice that Mr. F. W. Barnes's new spring saddle was not fitted, as we hear golden opinions of the comfort it provides, some going so far



The Scott riders : H. O. Wood, B. Alan Hill, Capt. C. P. Wood, and W. L. Guy.

The A.C.U. Six Days Trials.—

as to suppose that it may dispense with the need for a spring frame.

A Variety of Types.

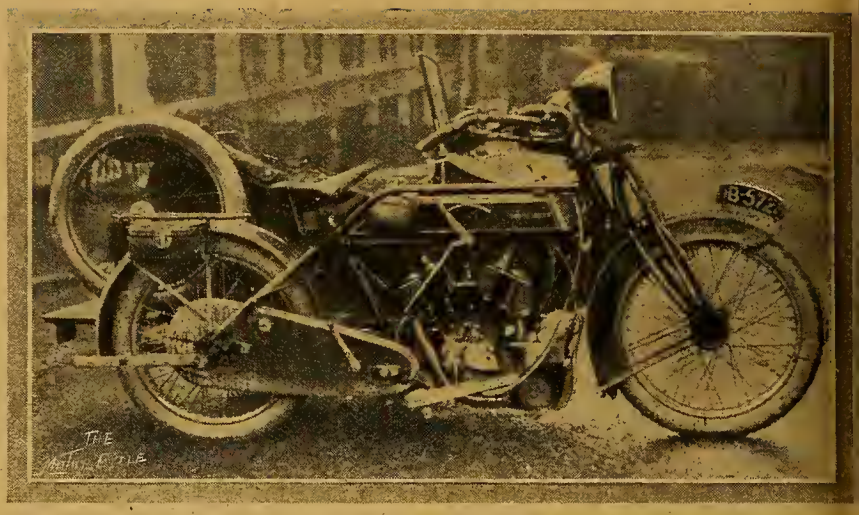
The James team is representative of all James productions, from the two-stroke lightweight to the luxurious sidecar outfit. The Douglas range, too, is

Twin silencers on a B.S.A.

very complete, being representative and businesslike, and their riders are all men of extensive competition experience.

Quite a number of competitors are using benzole, which fact invests the trial with added interest. They are bound to show up well when the checked consumption figures are divulged.

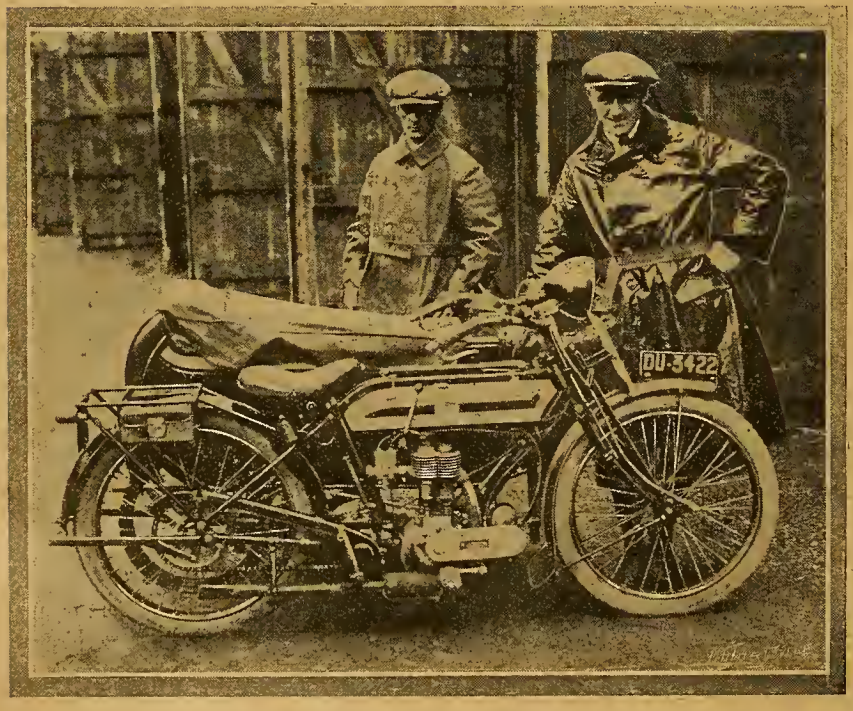
Great interest centres in the A.J.S. Matchless and Clyno combinations, for here we have some of the best passenger machines that British motor cycle engineers can produce. Their initial performances have been impressive. One is sorry to observe that few three-wheeled runabouts of the Morgan type—a number of new makes of which have lately made their bow to the public—are competing in this week's great event. The opportunity of comparing their performances with the best of the sidecar outfits must be postponed for some time as a result, though the team of Morgans may be expected to uphold all the excellent traditions they set up as the successful forerunners of the weatherproof and reliable vehicle of motor cycle type. Following upon a recent decision of the A.C.U. no four-wheelers are admitted this year—a policy sound in itself, but regrettable no doubt to many who, with possibly £200 to expend in a motor vehicle, desire to invest it in any form of three or four-wheeler whose general performances are the most praiseworthy, if running costs are moderate.



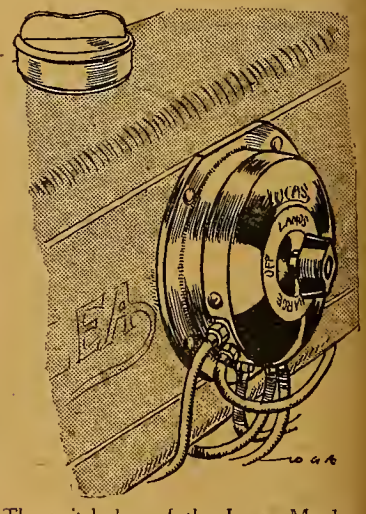
An interesting machine at Llandrindod Wells—W. H Egginton's 8 h.p. sidecar—one of the only two experimental models fitted with the new Sunbeam twin engine.

Ariels, both single and twin, with a competition record second to none, strike one as sound designs, whose records only ill-luck can check. The Blackburne riders, possessing such flexible engines—excepting the two-strokes and flat twins (they are the only engines with outside flywheels in the trial)—attract attention by the slow tick over of the engines when in the free position.

Creak Davis is riding a khaki-finished Chater-Lea, the sidecar having five separate connections. It has, too, the Lucas Magdyno, with a neat switch mounted on the side of the huge petrol tank. Davis is not new to six day events, nor is his passenger, Mrs. Davis, for that matter.

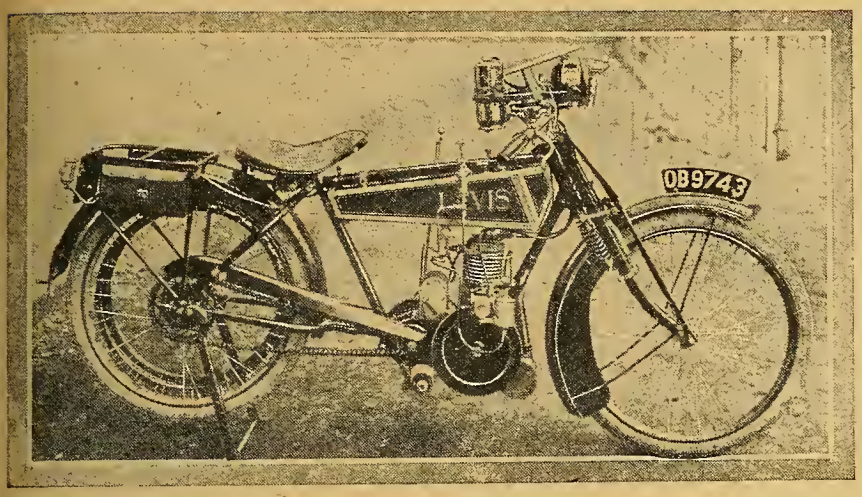


The 1920 chain-driven Triumph, with the new Triumph gear box and improved front fork ridden by G. Shemans, who is seen on the right.



The switch box of the Lucas Magdyno, fitted on the Chater-Lea.

Though described as a six day event, the 1919 A.C.U. reliability trial is a five day, or more correctly a four and a half day event, for Monday was devoted to official inspection and sealing, whilst the sixth day (Saturday) will be taken up by a thorough examination of the competing machines by the judges, since



The 1920 Levis, entered by Messrs. Butterfield's, Ltd.—P. Pike, rider

"condition" marks will again enter largely into the final classification of the competitors.

The Riders and their Machines.

CLASS A.—FOR MOTOR BICYCLES NOT EXCEEDING 250 C.C.

1. J. F. Lidstone (2¼ James).
2. P. Pike (2¼ Levis).
3. R. H. Baxter (2¼ Radco).
4. L. C. M. Davies (2¼ Velocette).
5. E. F. Goodman (2¼ Velocette).

CLASS B.—FOR MOTOR BICYCLES NOT EXCEEDING 350 C.C.

6. Thos. J. Stordy (2¾ A.J.S.).
7. S. T. Ashby (2½ Connaught).
8. F. C. Ball (2¾ Douglas).
9. W. B. Gibb (2¾ Douglas).
10. J. R. Lane (2¾ Douglas).
11. Chas. Hartwright (2¾ New Imperial).
12. H. L. Kitcher (2¾ New Imperial).
13. B. Kershaw (2½ Verns).

CLASS C.—FOR MOTOR BICYCLES NOT EXCEEDING 500 C.C.

14. J. Emerson (3 A.B.C.).
15. H. Fairley (3 A.B.C.).
16. Tom Peck (3½ Ariel).
17. C. W. Smith (3½ Ariel).
18. T. B. C. Vale (3½ Ariel).
19. P. J. Enticknapp (4 Blackburne).
20. J. Watson-Bourne (4 Blackburne).
21. P. W. Moffatt (3½ Douglas).
22. James Edwards (3½ Humber).
23. G. A. Strange (3½ James).
24. E. F. Chidley (3½ P. and M.).
25. W. Drake (3½ P. and M.).
26. R. Lewis (3½ P. and M.).
27. W. Denskin ((3½ Rover).
28. G. Featherstonhaugh (3½ Rover).
29. Morris Isaac (3½ Rover).
30. Jessa Baker (3¾ Scott).
31. Mansel Davies (3½ Sunbeam).
32. W. R. Eadington (3½ Sunbeam).
33. G. Dance (3½ Sunbeam).
34. J. Dudley (3½ Sunbeam).
35. T. C. De la Hay (3½ Sunbeam).
36. Capt. Oliver (3½ Sunbeam).
37. J. A. Newman (3½ Sunbeam).
38. T. Rutherford (3½ Sunbeam).
39. J. T. Shillito (3½ Sunbeam).

CLASS D.—FOR MOTOR BICYCLES NOT EXCEEDING 750 C.C.

40. E. W. Choldcroft (4 A.J.S.).
41. F. W. Applebee (4¼ B.S.A.).
42. H. F. Edwards (4¼ B.S.A.).
43. L. L. Sealey (4¼ B.S.A.).
44. F. Turvey, jun. (4¼ B.S.A.).
45. A. E. Wood (4¼ B.S.A.).
46. V. E. Horsman (4 Norton).
47. Capt. Alexander Lindsay (4 Norton).
48. D. H. Noble (5 Rover).
49. W. Leslie Guy (3¾ Scott).
50. Capt. C. P. Wood, M.C. (3¾ Scott).
51. H. O. Wood (3¾ Scott).
52. Lt. B. Alan Hill (3¾ Scott).
53. Capt. F. C. Townshend (4 Sunbeam).
54. C. Cather-Cooke (4 Triumph).
55. Ernest Cross (4 Triumph).
56. H. Pattinson (4 Triumph).
57. M. Ryecroft (4 Triumph).
58. W. Elce (5 Zenith).
59. A. V. Sumner (5 Zenith).
60. Gerald Brown (5 Zenith).
61. R. Charlesworth (5 Zenith).
62. Kay Don (5 Zenith).

CLASS E.—FOR MOTOR BICYCLES NOT EXCEEDING 1,000 C.C.

63. J. W. Wills (6-7 Ariel).
64. Edgar Bottomley (7-9 Harley-Davidson).
65. Lt. Lauro de Aranjo (7-9 Harley-Davidson).

CLASS G.—FOR MOTOR BICYCLES WITH SIDECARS NOT EXCEEDING 500 C.C.

66. F. E. Jones (3½ Ariel).
67. W. J. Chambers (3½ B.S.A.).
68. Reg. Brown (3½ Sunbeam).

Next week's issue of "The Motor Cycle" will contain a description of the Six Days Trial, with many illustrations, by members of our own staff who are accompanying the competitors.

CLASS H.—FOR MOTOR BICYCLES WITH SIDECARS NOT EXCEEDING 750 C.C

69. C. Collins (6 A.J.S.).
70. Eric Williams (6 A.J.S.).
71. O. Wade (6 A.J.S.).
72. F. W. Giles (6 A.J.S.).
73. H. C. Heath (6 A.J.S.).
74. W. Edwards (4¼ B.S.A.).
75. Howard R. Lane (4¼ B.S.A.).
76. H. Thorpe (4 Douglas).
77. F. Thorp (5-6 C.L.).
78. T. Stevens (4¼ James).
79. G. E. Stohart (5-6 James).
80. S. Sawers (4 Norton).
81. F. G. Edmond 4 Triumph).
82. G. Shemans (4 Triumph).

CLASS K.—FOR MOTOR BICYCLES WITH SIDECARS NOT EXCEEDING 1,000 C.C.

83. F. J. Watson (6 Ariel).
84. J. L. Stocks (6 Ariel).
85. J. S. Holroyd (8 Blackburne).
86. S. S. Dehenham (6 Campion).
87. R. Creak Davies (8 Chater-Lea).
88. Hugh Gibson (8 Clyno).
89. Harry Reed (8 Dot).
90. John H. Place (8 Dot).
91. W. A. Fell-Smith (7-9 Harley-Davidson).
92. H. A. Leak (7-9 Harley-Davidson).
93. E. A. Colliver (7-9 Indian).
94. J. D. Prythercb (7-9 Indian).
95. L. A. Bees (7-9 L.M.C.).
96. C. R. Collier (8 Matchless).
97. G. D. Hardee (8 Matchless).
98. James A. Hoult (8 Matchless).
99. G. C. McGlashan (8 Matchless).
100. Fred W. James (8 Morgan).
101. H. F. S. Morgan (8 Morgan).
102. N. Svanso (8 Morgan).
103. W. R. Haggas (8 New Imperial).
104. J. Drew (8 New Imperial).
105. D. Alexander (8 Royal Enfield).
106. J. Dosher (8 Royal Enfield).
107. D. C. Guise (8 Royal Enfield).
108. Stanley Parker (8 Royal Enfield).
109. J. G. Lowles (8 Sunbeam).
110. Harry Jepson (8 Zenith).

CLASS L.—FOR MOTOR BICYCLES WITH SIDECARS EXCEEDING 1,000 C.C.

111. W. J. Barker (10 Henderson).
112. H. Greaves (10 Morgan).
113. Sydney Hall (10 Morgan).
114. W. Douglas Hawkes (10 Morgan).
— R. G. Mundy (8 Matchless sc.).

INCIDENTALLY——

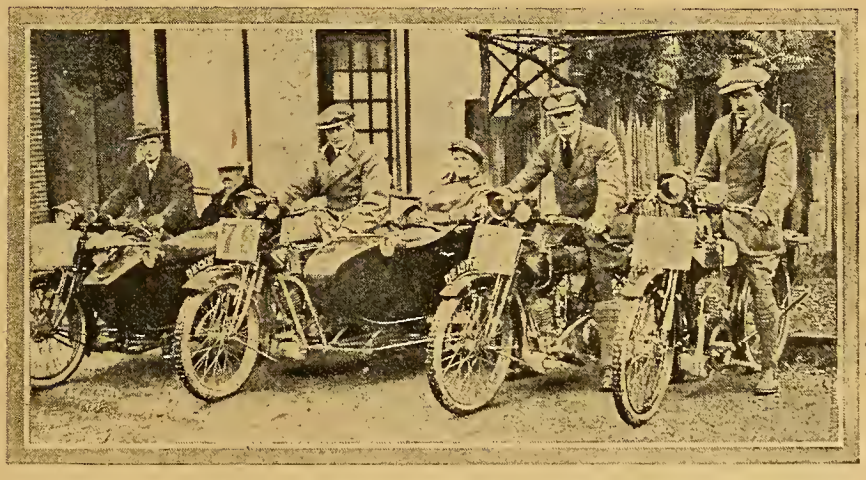
Too much last minute preparation was noticeable.

Great Britain, France, and America are the only countries represented among the competitors.

The riders are very largely composed of ex-Service men, including majors and captains.

Drivers of three 3½ h.p. sidecar outfits are sufficiently confident of their chances to have entered this, the most severe Six Days event yet arranged.

Caio Hill, in to-morrow's route, is said to be as difficult as any in the trial. The contour reminds one of the roof of a house.



Four types of James machines in the trial. T. Stevens (4¼ h.p. single sc.), G. E. Stobart (5-6 h.p. twin sc.), G. A. Strange (3½ h.p. twin), J. F. Lidstone (2¼ h.p. two-stroke)

FIRST DAY'S RUN DESCRIBED.

111 STARTERS—110 SURVIVORS.

MONDAY'S ROUTE: 98½ Miles.

Llandrindod, Builth, Garth (consistent driving test), Brecon, Llangynidr, Abergavenny, Talgarth, Builth, Llandrindod. The return journey from Abergavenny was undertaken in the dark and included a lamp test.

Ideal riding conditions prevailed on Monday in contrast to the inclement weather of the two previous days. The morning was devoted to replenishing and sealing the vital parts of the machines, and arranging them in marked off spaces in the Drill Hall and at Tom Norton's garage adjoining the railway station. There was more than the usual scene of animation outside, for the interest in this year's event is exceptional. Many prominent trade representatives were there, not only watching their own riders' interests, but intently examining the features of other makes of machines. By noon all but five entrants had reported themselves, and after an adjournment for lunch, the trial proper commenced at 2.30, in the presence of a considerable crowd.

The Start.

Around a clock outside the Drill Hall the various competitors' numbers are arranged, and as the hand points to the numbers a bell is rung, and number cards are handed to the competitors concerned, after which they obtain their machines from the garage. Before actually leaving Llandrindod competitors were taken through the goods station yard, and each machine weighed as it stood, in complete touring trim. Then the long journey was commenced, *via* Howey, Builth, and Garth, beyond which place the consistent driving test was encountered. Sumner was unlucky in sustaining a collision with a Ford when leaving the station yard. There were cattle on the roads for the first few miles, as it was Builth Fair, and the farmers here formed a line to watch the procession of riders.

Panne Hill, near Garth, is a fairly difficult climb, exceeding two miles in length, with three bends, the last the most acute, but the gradient does not exceed 1 in 8 at any point, and the surface is moderately good. Early competitors were up in arms against the consistent driving test. They argued, not without good reason, that it was rather a test of the driver than of the machine. Certainly, the Six Days Trials are regarded as tests of motor cycles and, so far as is possible, the personal factor should not enter into the condition of awards.

Generally speaking, the performances were not brilliant, for it must be admitted that the long and tiring climb heated up many engines to the point of knocking on the bends, and there were several failures. There were, however, notable exceptions. Hardee climbed well, as did all the Matchless machines. The Velocettes and the Levis ridden by Pike made no mistake; the latter is riding an old model after all, but Colliver (Indian), mentioned in the introductory notes, received a new carbon brush and holder on Monday morning in time to fit them.

Parker's Enfield misfired most of the way up, the Dot-Japs made impressive climbs, and the Triumphs were noticeably fast on the upper reaches, even with sidecars attached. Drew's New Imperial did well, also Moffatt's 3½ h.p. Douglas and Stevens's single-cylinder James sidecar. Charlesworth (Zenith) was fast, but Dance stopped momentarily for some reason, though he at once restarted. Hawkes's Morgan was quite fast, and the Scotts were much admired by the spectators. The Blackburnes and Rovers performed conspicuously. Applebee's B.S.A. travelled well, but Chambers, on a 3½ h.p. sidecar of the same make, was naturally slow, and was passed by Bees (L.M.C.) and Peck (Ariel), but later Bees stopped on the top bend.

Others who stopped were Dosher (8 h.p. Enfield sc.) and Lane (B.S.A.), due to overheating, Edwards, who changed a plug, and Lowles (8 h.p. Sunbeam), whose timing slipped just below the timekeeper.

The positions of the timekeepers were not sufficiently clearly marked, but the route generally is splendidly arrowed. Prytherch (7-9 h.p. Indian sc.) broke a high-tension wire, which delayed him twenty-five minutes. Good roads followed to Brecon, where crowds lined the streets. Shortly afterwards, however, the route took the competitors down a byroad, with difficult corners. The test hill of the day was shortly after the 41st mile. Starting up in a sinuous climb through Llangynidr a rough lane led to the crucial point, a sharp right-hand corner on a steep gradient, followed by a two-mile ascent. Eleven competitors failed, one, Barker (10 h.p. Henderson sc.), owing to his gear lever slipping into neutral. Restarting he wrenched off his front tyre.

A long descent followed, to Abergavenny, where tea was taken and lamps lit.

The Return Run.

The return run was uneventful, the roads on the whole being excellent. There was a steady climb of ten miles over the pass above Talgarth, but no serious gradients. The lamps generally behaved most satisfactorily. The competitors were arriving up to eleven o'clock, and before returning to the garage the tanks had to be replenished. All except Sumner checked in.

Dr. Low, whose audiometer was installed on Panne Hill, tells us that the results were disappointing, except for a few notably silent machines.

OBSERVATIONS.

Only five competitors failed to face the starter. These were J. R. Lane (2¾ Douglas), C. Hartwright (2¾ New Imperial), Lt. L. de Aranjo (7-9 Harley-Davidson), W. Elce (5 Zenith), and H. A. Leak (7-9 Harley-Davidson sc.).

Tuesday's run started under favourable weather conditions, the whole of Monday's survivors leaving Llandrindod in practically every case without adjustments being found necessary.

Working from 4.30 a.m., Mr. T. W. Loughborough and his assistant, Maj. Dixon Spain, had all the weights and consistent driving times on the notice boards for all to see on Tuesday morning.

On the previous page is given a list of competitors, to which must be added E. W. Merrall, who is driving a 1915 Jap-engined 8 Morgan.

In the fast stretch of the consistent driving test, the lightweights averaged 14 m.p.h., and the 3½ h.p. machines about 20 m.p.h.

The lightest machines in the respective classes were as follow: 250 c.c., 2¼ Radco, 170 lb.; 350 c.c., 2½ Connaught; 500 c.c., 3½ P. and M., 268 lb.; 750 c.c., 4 Triumph, 256 lb.; 1,000 c.c., 6-7 Ariel, 336 lb.; 500 c.c. sidecar, 3½ Ariel, 444 lb.; 750 c.c. sidecar, 4¼ B.S.A., 464 lb.; 1,000 c.c. sidecar, 6-7 Ariel, 488 lb.; over 1,000 c.c. sidecar, 10 Henderson, 588 lb.

The chief item of interest of Tuesday's run was the brake test at Pumpsaint during the morning.

Among the most notable performances in the consistent driving test may be mentioned: Fairley (3 A.B.C.), 7.45 m.p.h. slow, 22.65 m.p.h. fast; Horsman (4 Norton), 8.2 slow, 24.25 fast; Charlesworth (5 Zenith), 8.85 slow, 24.15 fast; Edmund (4 Triumph sc.), 6.95 slow, 22.35 fast; Alexander (8 Enfield sc.), 6.8 slow, 25.25 fast; and Wills (6-7 Ariel), 7.35 slow, 24.05 fast.

The Second Half of the Trial.

Yesterday Bwlch-y-Groes was the *pièce de résistance* of the day—approximately the half way mark in the trial. To-morrow's 159 mile run will bring the total up to 570 miles, the route being Llandrindod Wells, Newbridge-on-Wye, Builth, Upper Chapel, Garth, Llanwrtyd, Llandovery, Lampeter, Tregaron, Ypsytty-Ystwyth, Devil's Bridge (lunch), Devil's Bridge, Aberystwyth, Machynlleth, Stay-a-little, Llandiloes, Tylwch, St. Harmon, Rhayader, Llandriudod.

On Friday a further 161 miles are added to the trial, which completes the 732 mile total. The consistent driving test on the hill from Garth, climbed on Monday, will be repeated, and the competitors will pass through the following towns and villages: Builth, Garth, Beulah, Llanwrtyd, Llandovery, Llangadock, Pontardawe, Neath, Swansea (lunch at the Royal Hotel), Pontardulais, Llanddarog, Llanfynydd, Abergorlech, Llansawel, Caio, Cilycwm, Llanfair-ar-y-bryn, Llangammarch, Garth (consistent driving test), Builth, and Llandrindod.

Saturday is being devoted to a "technical" examination of the machines, when penalties up to a maximum of 50 marks will be imposed upon those machines which have suffered undue deterioration.

Essex M.C.

A gymkhana has been arranged by the above club for the 27th inst. at the Essex Track, High Beech. Any members of affiliated clubs will be welcomed as competitors, and entries must be received before September 25th by Mr. F. A. Applebee, 208, Great Portland Street, W.1.

Reading and District M.C. and L.C.C.

This club's social run to Savernake Forest on the 7th inst. proved a very enjoyable affair. One member demonstrated that it was possible to ride a sidecar with the wheel off the ground up Salisbury Hill, which includes two awkward bends

Cardiff City and District M.C. and L.C.C.

On Friday, the 5th inst., at the Grand Hotel, Cardiff, a large gathering of motor cycle and light car owners met and decided to inaugurate a club. The name selected was "The Cardiff City and District Motor Cycle and Light Car Club," and it is to be affiliated to the Auto Cycle Union. This club will fill a much-needed want in Cardiff, and prospective applicants for membership are beartily invited to communicate with the hon. sec., Mr. E. C. Pascoe, 100, Llanfair Road, Cardiff, who will be pleased to give them further particulars. The next meeting will be held on Friday next at 8 p.m. at the Grand Hotel, Cardiff.

Liverpool M.C. Open Trial.

On Saturday, October 25th, the Liverpool Motor Club will hold its open Reliance Cup trial. Its importance may be gauged by the imposing list of cups and medals that are offered: Reliance open challenge cup, Reliance amateur challenge cup, Read Martin challenge cup, Mogridge memorial cup, O. Ware prize for amateurs on A.J.S. machines, Butterworth trophy, gold medals for ninety-six marks or over, silver medals for ninety marks or over, and bronze medals for completing the course within thirty minutes of schedule time.

The trial will be held in North Wales, and the course will cover about 165 miles.

A team of three riders on the same make of machines may enter, and the winning team will receive a cup for each rider.

During the trial, petrol consumption, acceleration, brake, and flexibility tests will be held, and at one time during the run machines will be examined for cleanliness.

Applications for entry forms should be addressed to E. Norman Dean, hon. sec., 22, Lend Street, Liverpool.

Future Events.

SEPT. 18-20.—A.C.U. SIX DAYS RELIABILITY TRIALS (concluded).
Sept. 19.—Cardiff City and District M.C. and L.C.C. General Meeting, Grand Hotel.
Sept. 19.—Essex M.C. Gymkhana.
Sept. 20.—Blackburn and District M.C.C. Hill-climb on Waddington Fells.
Sept. 21.—Rochester, Chatham, and District M.C. Treasurer's Surprise Run.
Sept. 21.—Reading and District M.C. and L.C.C. Run to Hindhead.
Sept. 21.—Eastern Counties M.C. Picnic at Norton Heath.
Sept. 21.—N.M.C.F.U. (Leeds) Run to Boroughbridge.
Sept. 27.—Coventry and Warwickshire M.C. Hill-climb.
Sept. 27.—Essex M.C. Gymkhana.
SEPT. 27.—WOLVERHAMPTON M.C.C. OPEN HILL-CLIMB AT STILE COP.
SEPT. 27.—SCOTTISH A.C.U. SPEED CHAMPIONSHIPS AT ST. ANDREWS.
Sept. 27.—Reading and District M.C. and L.C.C. Flexibility Hill-climb.
Sept. 27.—Exeter M.C. and J.C.C. Trial.
Sept. 28.—Rochester, Chatham, and District M.C. Consumption Test.
Sept. 28.—Reading and District M.C. and L.C.C. Run to Virginia Water.
Sept. 28.—Eastern Counties M.C. Afternoon Run to Harlow Bush.
SEPT. 28.—THE SCOTT SPORTING TRIAL.
Sept. 28.—N.M.C.F.U. (Leeds). Scott Trials (Charleston).
Sept. 28.—N.M.C.F.U. (Wolverhampton). Run to Crackley Bank, Wellington.
Sept. 28.—Manchester M.C. Closing Run
Oct. 4.—Essex M.C. Hill-climb.
Oct. 4.—Birmingham M.C.C. Captain's Day
Oct. 4.—Edinburgh and District M.C. Trial for Amateurs for Palmer Trophy.
OCT. 25.—LIVERPOOL M.C. OPEN RELIANCE CUP TRIAL.

Blackburn and District M.C.C.

The annual hill-climb will be held at Waddington Fells on the 20th inst. at 3.30 p.m. The classes will include motor scooters, lightweights up to 270 c.c., lightweights up to 350 c.c., standard touring motor cycles up to 560 c.c. on handicap, sporting motor cycles up to 560 c.c., classes for solo machines up to 750 c.c., and classes for unlimited solo motor cycles and passenger classes up to 560 c.c., and unlimited passenger classes. Entries closed on Friday last.

Wolverhampton M.C.C.

This club's third annual open hill-climb will be held at Stile Cop, near Rugeley, on Saturday, the 27th inst. Ten events, with separate classes for experts, are arranged for in each class, and cater for all classes of machines from the scooter to the powerful twin. The meeting will be held under the auspices of the Auto-Cycle Union, and the prizes offered are quite attractive. Mention should be made of a special departure the club is making with formula prizes in one or two of the events. Timing of competitors will be electrical, and telephonic communication is to be down for this event. All intending competitors should get into touch with Mr. J. E. Greenwood, Trials Secretary, 2, Stubbs Road, Wolverhampton.

Carmarthen M.C. and L.C.C.

Capital sport was witnessed at this club's recent speed trials on Pendine Sands. The chief results are as follow:

557 c.c. Class (Solo).
1. Segonina (3½ Norton).

Sidecar Class
1. Thomas (6 James).

Trial for Scottish Amateurs.

The Palmer Tyre Co. has asked the Edinburgh M.C. to organise a trial for amateurs resident in Scotland, and has offered a handsome trophy, which is to be won outright. The event is open to all solo, sidecar, and runabout owners who are "amateurs," *i.e.*, those who are *bona fide* owners of their machines, and who are not in any way connected with the motor industry. Standard touring bodies must be fitted; toolbags will be sealed, and both driver and passenger are liable to be searched. The date fixed is October 4th, and entries close on Tuesday, the 30th inst. The start will be at 11 a.m.; the route will be as follows: Liberton, Gifford, Redstone Rigg, Garvald, Elmscleuch, Crickness, Snout Hill, Donnally, Haddington, and back.

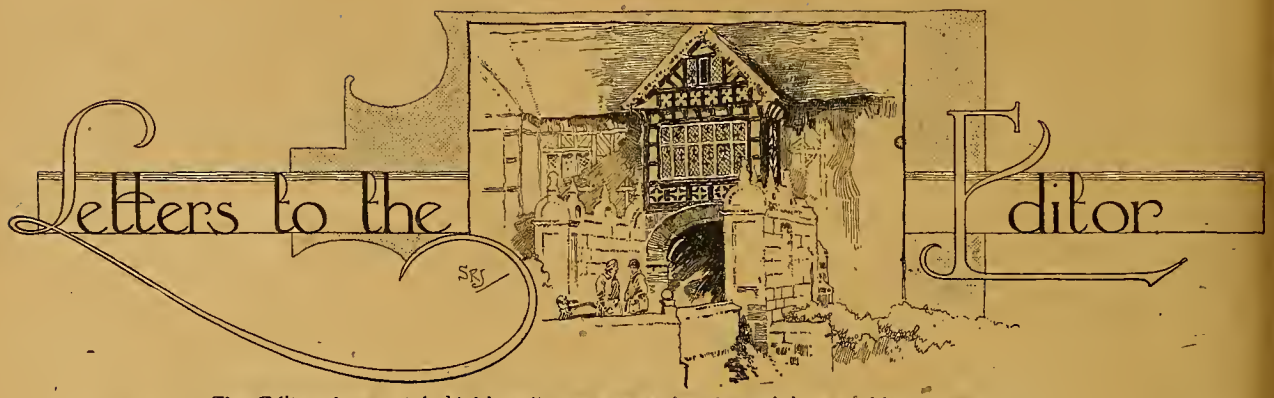
Further particulars may be obtained from Mr. J. Watt Anderson, 6, Castle Terrace, Edinburgh.

Cumberland County M.C.C.

This club has instituted a movement which other leading clubs of the country might do well to copy. In running off the many strenuous trials which the club has from time to time mapped out for itself and carried through with very marked success, it has, of necessity, enlisted the services of a number of enthusiastic motorists of various parts of the country, and more particularly in Scotland, where its more prolonged trials are held, and it has felt so much indebted to these gentlemen that it has requested the following to allow themselves to be elected as honorary members of the Cumberland County Motor Cycling Club, and which they have all been pleased to do. The names are as follow: Messrs. John Beveridge and R. G. Steel (Perth), John Grant and A. T. Lunn (Crieff), J. Maller and A. R. Monteith (Stirling), and Tom Gillies (Hawick).

BIRMINGHAM SERVICE MOTOR CYCLISTS.

It has been decided that the welcome home meeting for Birmingham Service motor cyclists shall take place on Friday, October 17th, in the Grosvenor Room, Grand Hotel, Birmingham. The guests will be limited to 200, and each guest will be at liberty to invite one friend to the concert which will follow.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Moto. Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address

DELIVERY.

Sir,—Your correspondent "L.C.W.," in your issue of September 4th, seems to have been more fortunate than some of us in getting delivery from Messrs. Douglas. I gave an order for a 2¾ h.p. motor cycle some time in March from a local agent; now it is September, and I am just as far from getting a machine. Do London agents get a preference? If so, I do not think it fair, as orders should be sent off in rotation as received. H.W.T.

High Salvington.

THE OVERHEAD VALVE NORTON.

Sir,—We are much interested in the illustration of a Norton engine with overhead valves ridden by a private owner at Weston-super-Mare.

Although we commenced experiments with this type of engine something like fifteen years or more ago, we are not at present supplying an overhead-valved engine, the one in question being made entirely upon the owner's initiative, and by himself. We can congratulate him upon a very workmanlike and sound job.

We mention this, as, from our experience in the past, any reference to an alteration of design in your pages has caused us to be inundated with enquiries, and many of the writers take it as a personal slight if we are unable to supply.

We might here mention that never have we made a departure from our standard engine in the shape of special cams, cylinders, or such like for competition purposes, machines always being to catalogue specification.

NORTON MOTORS, LTD.

HONOUR TO WHOM HONOUR.

Sir,—As a welcome contrast to the treatment that I have sometimes received at the hands of large garages, I should like to record the courtesy of the Moortown Motor Cycle and Cycle Co., of Leeds. I was held up last Sunday with magneto trouble, but a gentleman from the above garage passed, offered his help, and finally (although on his way to church) took my machine to his garage, went home and changed, and also took me to his home and gave me tea, after which he remedied the defect and wished me good-bye; all this in spite of the fact that his garage was locked up and the keys were some distance off. J.D.W.

Sir,—In these days of indifferent service, the following may be of interest to the readers of your excellent paper.

A few days ago I bought a second-hand two-stroke fitted with an E.I.C. magneto, in which the contact breaker was damaged. I took the magneto off the machine and sent it to the makers for repair. Imagine my surprise when the magneto was returned to me in *less than a week* with a new contact breaker fitted and nothing to pay.

I have since tested the magneto over a couple of hundred miles, and can bear out the makers' statement that it is better than the Bosch. Usual disclaimer.

JOHN HARRISON.

Sir,—I wonder whether any other readers have been so fortunate to meet with such consideration as was shown me last week? I was on a journey from Brockenhurst to Exmouth, when the clutch on my Rover motor cycle began to slip, the complaint becoming so chronic that I had to stop at Bridport. By chance, I was recommended to try Ganges, a small engineering firm, and although it was seven o'clock and Saturday evening, the job was started, and took till after midnight to complete, including a small forging, the charge for a first-class job being quite nominal. There was a member of the firm on the premises before 8 o'clock on Sunday morning, so that I could make an early start. Such good treatment, I think, would be hard to equal anywhere. E. BROWN.

Sir,—May I recommend any of the readers of *The Motor Cycle* who require small parts made accurately to write to Mr. C. R. Foster, 170, Cardigan Road, Leeds, whom I have found to be invariably courteous and obliging. I was home on leave a short time ago and broke my exhaust valve the first day. I took the bits to Mr. Foster and explained the circumstances, and at considerable inconvenience to himself he had a valve turned up to fit my engine straightaway. This is only one of several occasions when he has shown himself to be courteous and (more to the point still) capable of "delivering the goods."

I have no interest in the firm other than that of a very satisfied customer. CLIVE BARRACLOUGH

311 M.P.G.

Sir,—With reference to the Ealing and District M.C. Club's Petrol Consumption Trial, in which a 2¾ h.p. Wooler motor cycle is reputed to have done 311 m.p.g., the method by which this was measured gives so much scope for inaccuracy, that the record is of no practical value whatever.

The carburetter was flooded before the trial but not afterwards, and over the short course used, 880 yards, the petrol contained between the flooded and normal working levels would run the machine anything from 25% to 50% of the total distance, and would not be counted in the final consumption. In fact, with a large enough float chamber, one might show no consumption of petrol at all over a half-mile run.

My own machine, a 4 h.p. Triumph, in a further trial in which the carburetter was not flooded at all, gave a consumption of about 107 m.p.g. as against 146 m.p.g. in the club trial, so that instead of the accuracy within 3% claimed for the apparatus used, 30% would seem nearer the mark. F. A. HUDSON, M.A., A.M.I.C.E.

THE SCOTT TRIAL.

Sir,—I am pleased to note that according to your issue of September 4th the Scott Motor Cycle Co., Ltd., are going to hold one of their special reliability trials on September 28th.

Previous to the war I used to reckon that these little outings were most interesting from a sporting, an instructional, and a social point of view. I can personally testify that they are run in quite a happy spirit, and I can also guarantee that anyone who takes part therein "must go some," for the routes are invariably of a colonial type, and as they are of this nature I always hope to see teams composed of American machines endeavouring to prove their superiority over the handy Scott.

Personally, I am not a Scott rider, but I have had some little experience of this mount, and am of the opinion that for a "rough and tumble" ride it requires some beating, and I would sooner tackle a bad course on a Scott, which

we all know is one of the handiest mounts on the road, than on a heavy multi-cylinder machine, but I am open to have my opinions altered if any makers or teams of riders can do it on the 28th inst.

By the way, I was at the Sutton Bank Hill-climb on the 6th inst., and noticed that an Indian, an A.B.C., and a 2¾ h.p. A.J.S. made some remarkably fine ascents. Would not teams composed respectively of these machines make the Scott people look to their laurels?

It would be "some" event. H. W. FORTUNE.

SPARE PARTS.

Sir,—I think it may interest your readers (if any happen to be in possession of faulty Cowey speedometers) to know that this firm has supplied me with a new worm drive for my speedometer by return of post. H. W. CROPP.

Sir,—I should like to place on record yet one more instance of prompt and courteous treatment I have recently received at the hands of Messrs. H. Miller and Co., Ltd. The trouble, a defective generator, although my own fault, was repaired, no charge being made at all, and was back in my possession within twenty-four hours. I was told at various garages "they (the makers) would take quite three weeks to repair it." Instances such as these make motor cycling a pleasure instead of a burden.

Needless to say, I have no interest whatever in this firm.

Birmingham. OE 1287.

Sir,—Having read your splendid paper week by week from cover to cover for some seven years past in silence, I should be glad if you could spare the space to insert the following three points:

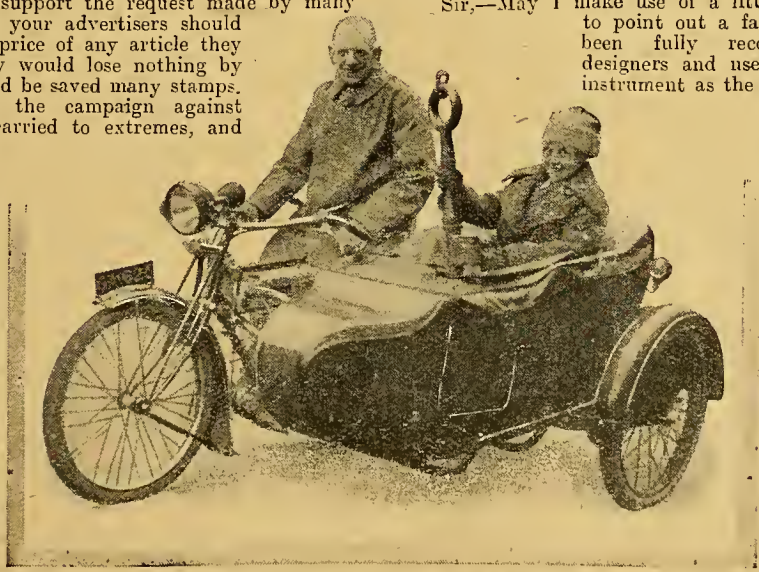
(1.) With regard to treatment received from firms, I should like to give my experience concerning two firms as a contrast to the continual complaints from some of your readers. A few weeks ago I purchased from an agent a Premier mechanical horn. This almost immediately gave trouble, and after a week or two I have several ineffectual attempts at repairing it. No good being done, I passed it on to a professional repairer, who replaced one or two parts, but did it no real good. As a last resource I wrote to the makers, Messrs. Gratze, Ltd., who replied that they would replace it or repair it free of charge—this despite the fact that I told them it had been tampered with. Upon sending it back I almost immediately received a brand new one with their compliments. How is that for good treatment?

The other firm who have invariably accorded me prompt and courteous treatment on the several occasions I have had to write to them for replacements are Messrs. Rudge-Whitworth, Ltd., and anything which I require I can be sure of getting from them by return post.

(2.) I should like to support the request made by many of your readers that all your advertisers should be required to give the price of any article they advertise for sale. They would lose nothing by it, and your readers would be saved many stamps.

(3.) I consider that the campaign against pillion riding is being carried to extremes, and the alleged dangers greatly exaggerated. I am not a rider who habitually has an ornament on his flapper bracket, and prefer riding solo, but have carried passengers in this way some thousands of miles, during which time I have suffered one spill with a passenger and two riding solo. Provided reasonable care is exercised, the danger is negligible—at least, that is my confirmed opinion. To say the brakes are rendered less efficient is fallacious, for I have *proved* that the brake may be used with greater force and the 'bus brought to a standstill quicker with a passenger than without one, because the wheel will not lock so readily. On my Rudge the balance and steering are virtually unaffected.

Bedford. RUDGE-MULTI.



KEYS ANCIENT AND MODERN.

The passenger in the sidecar is holding the enormous and ancient key of Penrith, but the rider of the Triumph holds a more valuable key—that of the open road!

SPEED WOBBLE.

Sir,—With reference to the letter in *The Motor Cycle* of August 21st signed "G.E.S." on the subject of speed wobble, I think the explanation is quite simple.

Present-day roads are quite unfit for a speed of 65 m.p.h. "G.E.S." probably struck an uneven piece of road, which caused the machine to wobble, the braking effect of suddenly closing the throttle made the wobble worse, and "just hanging on" implies that this unwise rider lost his head at the critical moment, and was lucky not to lose his life. I hope it will not be my misfortune to meet him doing 65 m.p.h. on a machine he has never ridden before, or on any other machine for that matter! ANTI-ROAD-HOG.

Englefield Green.

GEAR CHANGING WITH THE FOOT.

Sir,—Reading in your issue for Aug. 28th, "Ixion's" Occasional Comments, I was interested in his remarks on the Novice and the control of modern motor cycles, where he states that they always wobble when changing gear. I can quite understand this, and know that when riding solo on a motor cycle where a hand has to be taken from the handle-bar to change speed, even riders of long experience wobble, but what I should like to point out is, that it is totally unnecessary to take a hand from the handle-bar for any control. Has "Ixion" tried the Triumph when ridden as the D.R.'s and others rode them when on Active Service, namely, changing gear by the right foot? Most motor cycles and cars are awkward in regard to control when a change is made from a mount to which one has been accustomed. One can get used to any form of control, but possibly not be comfortable. I emphasise this point, as perhaps some riders will think that changing gear with the foot as I do myself on a Triumph fitted with a S.A. countershaft gear box is a form of trick riding.

I wish to assure users of Triumph and other similar machines that when they have got used to this method they will never return to another for solo riding.

In conclusion, if a Binks carburetter is fitted, changing speed will be as simple an operation as on a car; there is no need whatever to touch the clutch or exhaust lever; use the throttle lever as one does the accelerator on a car, and the changes can be made steadily, noiselessly, and without shock, and without taking the hand from the handle-bar.

Wimbledon. SGT. L.A.M.B.

STARTING JETS AS DECOMPRESSORS.

Sir,—May I make use of a little of your valuable space to point out a fact which I think has not been fully recognised by carburetter designers and users, namely, that such an instrument as the Binks three-jet, in which, for starting, a small jet is used, surrounded by a very restricted choke tube, is in itself a decompressor.

When the engine is revolved smartly, either by pushing the machine or by the kick starter, the small choke tube permits a rich charge to enter the cylinder, but, owing to the small size of the choke tube, the charge will be considerably less than would be required to fill the space swept out by the piston at atmospheric pressure; in other words, there will be quite a considerable partial vacuum in the cylinder when the compression stroke begins. A considerable part of

the compression stroke will then be necessary to raise the mixture to atmospheric pressure before any actual "compression" occurs; the final compression pressure will thus be considerably lower than if a full charge were drawn in through a large choke tube. The reduced pressure in the cylinder during the latter part of the inlet stroke, and the first part of the compression stroke, also helps any unvaporised particles of petrol to evaporate. From the foregoing somewhat long-winded remarks I hope some at least of your readers may gain something, and will realise that such an instrument as I have mentioned, in addition to providing the necessary small charge of rich mixture, also reduces the resistance to be overcome by the flywheels when starting or running dead slow.

I have no interest in the makers of the Binks carburetter, other than that of a prospective user, when I can get delivery of my next machine. D. H. GRIFFITHS.

A CANDID CRITICISM.

Sir,—While reading your ever excellent journal on August 28th (my usual occupation on Thursdays), I noticed Major J. Kennedy's letter concerning the 1919 Triumph. Now, if I am not encroaching on your valuable space, I would like to give my experiences and a few criticisms on the 1919 I.O.M. Rudge-Multi.

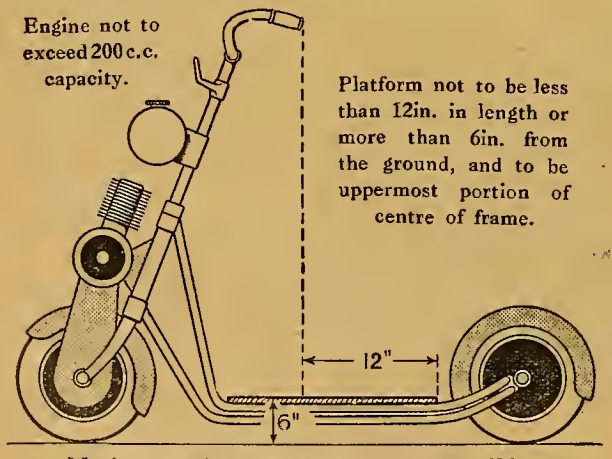
I have ridden many makes of machines, both English and American. This year I decided on the above machine after giving the matter much careful thought.

In the first place, I am more than satisfied with it in every way. The construction of the machine is excellent, the frame being exceptionally strong, and the riding position the most comfortable of any machine I have ever ridden, this being due to the sloping top tube. The balance and steering is magnificent, and, fitted with semi-T.T. bars, fatigue on a long run is unknown to me.

I must disagree with Major Kennedy's remark regarding one becoming "part and parcel" of the machine if it is American. I had an American machine before delivery of my present mount, and it was exceedingly uncomfortable compared with the Rudge. My tank I cannot complain about, its capacity being about two and a quarter gallons and the oil tank half a gallon. The foot oiling, for which the Rudge is famous, I much prefer to any other type; oily and dirty hands are things unknown. Petrol consumption is good, averaging about 90 m.p.g., and I hustle all the time. The oil consumption is negligible. As to gears, well, the multi-gear is a source of delight to me after gear boxes. One can amble along on a gear of about 3 to 1 comfortably at 35 m.p.h., and, judging from the contented beat of the engine, it appears to be about 20 m.p.h. There is a joy in "blinding all out" on this 'bus, but it is not to be compared to looping on a bare-backed mule, but rather to flying a "camel" at 120 on a calm day.

I need say nothing about the engine. To my mind, it is perfect.

A.C.U. DEFINITION OF A SCOOTER.



Engine not to exceed 200 c.c. capacity.
Platform not to be less than 12in. in length or more than 6in. from the ground, and to be uppermost portion of centre of frame.
12"
6"

Maximum weight, empty, not to exceed 60 lb.

Diagram of a scooter (not necessarily to scale), illustrating the proposed A.C.U. definition of a scooter.

Having a belt instead of a chain, the adjustment is very simple, due to the neat little belt adjuster.

Now, as to faults. My only complaint is the trouble of removing the cylinder for decarbonising, and the paper washer is unsatisfactory, as it is liable to be damaged.

I have no interest in the Rudge firm more than that of a thoroughly satisfied owner.

HAROLD W. MATTHEWS.

Sir,—I notice in your isue of August 28th a letter criticising the 1919 Triumph. Some of Major Kennedy's remarks are undoubtedly correct, but may I differ from him on one or two points?

The valve gear is certainly noisy, and I heartily agree with him in wishing the makers would fit something more substantial than a paper washer under the cylinder. I also agree with his comments on the gear box and the fitting of a draw bolt for both magneto and driving chains.

But now we differ. He suggests fitting a magneto advance lever on the tank, and says it is seldom necessary to move it. Personally, I hate unsightly levers on the tank, and it is far easier to operate it where it is. I live in a hilly district and often have to employ my spare lever when climbing Devonshire hills. Perhaps Major Kennedy lives in flat country where, of course, it is not so much employed.

I wonder why he has never found any use for the air lever, and, as for placing a hand-controlled slide on the carburetter, I dislike tying myself in knots when riding if I wish to adjust the mixture.

Perhaps his distaste for the air lever has something to do with his petrol consumption. I rode 540 miles recently in four days on a shade under six gallons of petrol, at an average riding speed of 27 m.p.h., which compares favourably with Major Kennedy's "70 m.p.g. when hustled!"

The same reason might apply to his criticism of the tank capacity—to fill up twice in a day means riding about 250 miles per day, which is rather a tall order "done frequently!"

As for the "paltry tyres," I may have been very lucky, but I have ridden 2,300 miles without a single puncture, and certainly have never been "miserably uncomfortable" in spite of a 150-mile day.

Altogether, the 1919 Triumph is one of the very best.

ROY S. HARTREE.

SCOUTS AND PATROLS.

Sir,—I have been a member of the A.C.U., but, fortunately, until recently, have been spared the necessity of calling for roadside assistance. I was travelling along Watling Street on a recent Sunday when my transmission chain broke. I had not been stopped many minutes when an *A.A.* man appeared. Imagine my surprise when he informed me he could give me no assistance as I was not a member of his union!

Since then I have marked these men more particularly, and I must say there are very few A.C.U. men about. It occurs to me that this surely is a case for co-operation under the one body, instead of different ones soliciting our membership and sending out their own assistants—clashing in some places and leaving others quite unprovided with patrols.

J. G. IRVING.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with "*The Motor Cycle.*"

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle, its care and management. Twentieth Edition. 286 pages. 400 illustrations.	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Sixth Edition. (Second Reprint).	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	4/6	4/10

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd. 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply**. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects

Minimum Age for Motor Cyclists

Can you tell me the minimum age at which it is possible to obtain a driving licence?

A licence to drive motor cycles only may be obtained by any applicant who is at least fourteen years of age.

Single for Sidecar Touring

I have a countershaft Triumph, and am quite satisfied with it, but I hope to come home next year, and, as my motor cycling experience only extends to the flat plains of India, I write for your assistance. My wife and I intend doing a lot of touring in England, and as I think I can get a better price for my machine in India than in England, I shall dispose of it before I leave. (1.) Would a similar machine be sufficiently powerful for extended touring without giving trouble? I am rather inclined to go in for a more powerful machine, say, 6 or 8 h.p. (we are both lightweights). Would 4 h.p. be enough for the hills one would meet with in England or elsewhere? (2.) On my return to India in the autumn I anticipate being stationed where I should not want a motor. Would any agent sell me a machine (new) on the understanding that he would take it back when I had finished with it? (3.) What would you say would be a fair percentage for depreciation? Of course, I should take care of the machine. (4.) Which is the better for touring, a chain-driven or belt-cum-chain? (5.) I fear I am no great mechanic, so would want a more or less fool-proof machine, my only experience being with hub gear and countershaft Triumphs. Will you kindly recommend a machine?—INDIA

(1) A countershaft Triumph will be quite suitable for touring with a sidecar in any part of the British Isles. Of course, 6 or 8 h.p. machines would enable you to keep up a higher average speed, but in other respects the extra power would not be necessary. (2.) Under present conditions, we do not think any agent would sell a machine on the terms you suggest. (3.) Provided you kept the machine in good condition, there would be little depreciation, say 10% after six months' running. (4.) In hilly districts, especially in wet weather, a chain drive is certainly more satisfactory, but the chain-cum-belt models are usually quite reliable, and the adjustments and tyre repairs, etc., are certainly more easily carried out. (5.) As you are familiar with the Triumph, you would be well advised to continue with this make.

Misfiring on One Cylinder.

My 3 h.p. twin has been running irregularly for some time lately. As I have just decarbonised the engine, and get an excellent spark at the plugs, I imagine the trouble lies with the carburetter, a Senspray. I think the jet is about right, as it caused me no trouble previous to the present irregularity. In altering the levels of the float there are three alternatives, adjusted by means of a small spring. When adjusted to the highest of these three points, the engine fires continuously on the front cylinder and shows no sign whatever of firing on the rear one. When adjusted to the middle point, the engine starts up at once and runs well, firing on both, for a short distance (anything from 100 to 500 yards) when it will suddenly die out. It starts up again at once and takes me another few hundred yards, when it repeats the same performance. When adjusted to the lowest level, the result is a combination of both the above symptoms. It will take me rather further in this case (about half to one mile) before stopping, but occasionally fires on the front cylinder only. I am continually taking the jet out, but have not yet found any obstruction.—L.L.B

The Senspray carburetter is not particularly sensitive to variations of level, and we rather think that your engine trouble is due to air leaks. Make certain that all the carburetter connections are tight, if necessary, wrapping them with insulation tape, also note if the inlet valves are worn in their guides, as a bad fit at this point is a common cause of indifferent running in two-cylinder engines. Also try setting the plug points a little further apart.

Hub Gear Adjustments

I have a 1914 Triumph motor cycle with Sturmey-Archer hub gear. I find on changing the gear from top to second or low gear the engine races and the wheels stop, and for a moment the machine will stop with the engine still racing, then suddenly it will dart away, run about two yards, and then stop dead. What is the cause of this?—NOVICE.

The trouble with your Sturmey-Archer hub gear is due to incorrect adjustment of the control rod, which apparently allows the gear to remain in neutral when changing, and is liable seriously to damage the gears by so doing. The correct adjustment is as follows: Make sure that the clutch is in firmly, place the gear lever in the adjusting position, which is between the top and middle on the Triumph control. The back wheel should now revolve freely, and without noise if the adjustment is correct. If this is not so, increase or decrease the tension on the rod as required by rotating the milled adjusting sleeve.

ON THE 1 IN 4 GRADIENT OF SUTTON BANK

Geoffrey S. Boston, at the recent York M.C.C. open hill-climb listens to the engine beat of his very lively 2¾ h.p. A.J.S. before changing gear

Fitting a Variable Jet.

Will you kindly give me your opinion as to the W.S.R. variable jet adapter. I have a 2¾ h.p. Douglas with Amac carburetter. Now, would the above adapter be of any use to my machine, say, on a steep and long hill, and would the fitment save petrol? Your candid advice would be very much appreciated. —A.B.A.

The variable jet adapter would probably be a very useful fitment on your carburetter. You could easily experiment in this direction by fitting a larger jet, when, if you notice an improvement in hill-climbing, it follows that a device allowing variations in the jet size would be useful, since you could open it out for hill-climbing and close it down to secure economical running under normal conditions.

Clutch Control.

(1.) I have a 1911 Triumph fitted with pedal clutch, and should like to know what you suggest as a method of adding a handle-bar control as well. (2.) The left-hand side of my rear fork has been slightly bent as a result of the cycle being "banged" up on the stand, thus throwing the wheel slightly out of truth. Will it weaken the fork to any appreciable extent if it is bent back with the aid of a blow-lamp? If so, can you suggest any other remedy? (3.) Is there any quick means of removing enamel from frames other than scraping and polishing? (4.) Do Robbialac and similar enamels set with a better finish if applied hot? And should it be finally treated with varnish?—L.G.S.

(1.) We do not think a handle-bar control would be very satisfactory with the old pattern Triumph clutch, on account of the amount of pressure which would be required to secure complete disengagement. (2.) It will be quite satisfactory if you straighten the rear fork by means of the heat of a blow-lamp. (3.) The quickest way to remove the enamel would be to burn it off. (4.) Robbialac and similar enamels must not be applied hot. They do not require varnish, though it improves the finish.

Finding Gear Ratios.

I propose to construct a light cycle car. Can you recommend a book clearly and simply explaining gear ratios? I shall use a Sturmey type three-speed gear box driving on to a countershaft, which will carry the pulleys for the final drive. I wish to know how to determine the sizes of the various pulleys, sprockets, and belt rims.—R.K.

The rule for determining the gear ratio between two sprockets or pulleys is to divide the pitch diameter of the driving into that of the driven sprocket, or in the case of a compound drive employing countershafts, divide the product of the diameters of all the driven sprockets (or pulleys) by the product of those of the drivers. In dealing with toothed gears or sprockets, it is easier to take the numbers of teeth instead of diameters. Thus, supposing in your suggested design you require a top gear of 4½ to 1, you could arrange it thus: First reduction, engine to gear box, 2 to 1. Gear box to countershaft, equal pulleys, giving no reduction. Second reduction, countershaft to road wheels, 2¼ to 1. You can arrive at this as follows: First reduction, engine sprocket, 15 teeth; countershaft sprocket 30 teeth. Second reduction, countershaft pulleys, 8in. diameter; rear wheel pulleys 18in. diameter. And the total reduction is given by equation.

$$\frac{30\times 18}{15\times 8} = \frac{9}{2} = 4\frac{1}{2}$$

Gear therefore equals 4½ to 1.

Hub Gear Adjustment.

Would you please give me the correct method of setting an Armstrong three-speed Mark VI. hub gear. There is a small hole through the quadrant marked adjuster.—C.E.P.

The gear should be adjusted in the following manner: See that the clutch is in engagement, move the change speed lever into the free or neutral position, unscrew the locking nut at the base of the gear control rod, and turn the adjusting sleeve until you find the free or neutral position by rotating the back wheel by hand in either direction. It is important to see that the elbow which carries the bell crank is screwed on to the spindle the correct distance, and the push rod lever lightly rests upon the carrier so that the correct movement is given to the push rod inside the axle.

RECOMMENDED ROUTES.

NORTHAMPTON TO EDINBURGH *via* DONCASTER.—W.

Northampton, Kettering, Stamford, Grantham, Newark, Retford, Doncaster, Boroughbridge, Northallerton, Darlington, Durham, Newcastle, Jedburgh, Melrose, Edinburgh.

WELLINGTON (SALOP) TO LONDON.—L.W.G.W.

Wellington, Gailey, Muckley Corner, Weeford, Coleshill, Stonebridge, Coventry, Dunchurch, Daventry, Weedon, Towcester, Stoney Stratford, Fenny Stratford, Dunstable, St. Albans, Chipping Barnet, London.

WELLINGBOROUGH TO ABERGAVENNY.—S.J.C.

Wellingborough, Northampton, Daventry, Southam, Leamington, Warwick, Stratford-on-Avon, Evesham, Tewkesbury, Ledbury, Ross, Monmouth, Raglan, Abergavenny.

WALSALL TO BOURNEMOUTH.—E.G.R.

Walsall, Birmingham, Alcester, Evesham, Tewkesbury, Gloucester, Stroud, Bath, Warminster, Salisbury, Fordingbridge, Ringwood, Christchurch, Bournemouth. Distance approximately 160 miles.

LONDON (WILLESDEN) TO CHORLEY.—A.J.S.

Willesden, Harrow, Watford, Boxmoor, Berkhampsted, Tring, Aylesbury, Bicester, Banbury, Stratford-on-Avon, Alcester, Headless Cross, Bromsgrove, Kidderminster, Bridgnorth, Wellington, Hodnet, Whitchurch, Tarporley, Warrington, Wigan, Chorley.

What's in a Name?

We learn that the engine recently described by us as the Buzmo (it was originally known as the Ace) has again been renamed, and will in future be known as the Duzmo.

A Useful Magneto Knife.

A handy magneto knife of the usual pattern has just been introduced by Tuck and Blakemore, Ltd., Coventry. It contains a gap gauge and contact file in addition to the Sheffield steel blade. The price is 3s. 9d.

Shortage of Douglas Spares.

Douglas Motors, Ltd., inform us that, as a result of the Government disposing of many thousands of incomplete machines, they have been inundated with orders for spare parts, and as a consequence further supplies will not be available until the first week in October.

Reading-Standard Agency.

Mr. Stanley J. Watson, Berners Works, 37, Sheen Road, Richmond, London, S.W.14, has been appointed sole agent for the Reading-Standard motor bicycle. Mr. Watson is well known in the motor cycle industry, and handled one of the principal Continental magnetos before the war.

The Inexorable Increase.

Owing to the recent advance in the cost of coal and its consequent effect on the price of steel, the Coventry Plating and Presswork Co., Ltd., inform us that the rates for all presswork and cycle mudguards will be now increased 10%, excepting motor cycle and light car mudguards which will be increased only 5%.

British Magnetos.

The Sunbeam machines ridden at the recent Birmingham M.C.C. hill-climb at Stile Cop last month by G. Dance and J. E. Greenwood were fitted with M-L magnetos. The former was first in four solo classes, first in stopping and starting, and made fastest time of the day and best performance on formula. The latter made fastest sidecar time of the day.

Complimentary Tickets for the Show.

The system which has hitherto been in force whereby agents' complimentary tickets for the Olympia motor cycle show were issued by individual manufacturers has been abandoned. In lieu thereof, a complimentary ticket will be sent by the Cycle and Motor Cycle Manufacturers' and Traders' Union direct to all whose names appear on its register of *bonâ-fide* agents. Should any *bonâ-fide* agent not have received a ticket by November 1st, the Union will be pleased to forward one on application to its offices, The Towers, Warwick Road, Coventry. Such application should be accompanied in every case by evidence that the applicant is a *bonâ-fide* agent.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

EASTERN GARAGE

IMPORTANT ANNOUNCEMENT

We much regret that, in consequence of short deliveries, we have been unable to execute some of the many orders for motor cycles which have been placed with us this season, and we fear a number of our clients will not now require their new machine.

We therefore beg to announce that in addition to continuing our policy of

Refunding Deposits in Full

and without question we have decided to pay to our clients who desire to cancel their orders

Interest at the Rate of 5%

per annum on the amount of their deposit.

At the same time we feel bound to

Warn Our Patrons

that the demand for machines next spring will probably be far more in excess of the number available than has been the case during the present year, and that they will be well advised to retain the

Priority in Delivery

to which they are now entitled. We shall be greatly obliged if clients, whose orders we still have in hand, will communicate their decision to us, so that we may immediately comply with their wishes.

[X2756

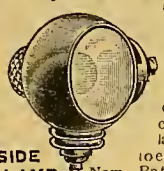
"VOLEX"
Dry Battery LIGHTING OUTFITS.
BRITISH MADE.

Volex Lighting Sets are the ideal, no-trouble outfits for the Motor Cycle and Sidecar.
For over ten years they have been in use for this service, and of recent years, in consequence of their dependeucy, the demand is constantly increasing.
Dynamo Lighting Sets with Accumulators require careful attention and owing to complications have a tendency to go out of order. Accumulators, if not regularly charged, whether in use or not sulphate and become useless.



"VOLEX" DRY BATTERY LIGHTING SETS give no trouble whatever. The Battery, which is fitted in a metal container with switchboard mounted on top, lies conveniently in the bottom of the sidecar and with ordinary care will last, when in use, from six months to eighteen months without renewal. New Battery can be fitted in a few minutes at but little cost. The Battery Case contains three separate Volex 4-volt Aero Dry Cells, with separate connecting boxes for the cables to Head, Side, and Rear Lamps. If one of the batteries becomes exhausted it can be replaced independently of the others. Unless specified, we always provide 4 volt Metal Filament Bulbs to each lamp, but 8 volt Bulb for Head Lamp will be provided where desired.
Complete outfit (as illustration), including Head Lamp, Ball Pattern Side and Tail Lamps, 3 Volex Aero Dry Batteries in metal container with switchboard, 2 Sets of Metal Filament Bulbs, and Water proof Conducting Cords. - - Price £6 10.
Spare "Volex" Aero Batteries 15/- each

CAUTION.—We would warn users that they may be offered substitutes for the "Volex" Dry Battery. No other battery will approach in reliability, durability, or capacity the British Made "Volex."

Sectional List, "VOLEX" DRY Batteries free on request.

UNITS of the above outfit.

HEAD LAMP, with switch and cord..... 32/-
SIDE LAMP, with lamp holder and cord..... 18/6
TAIL LAMP, with lamp holder and cord..... 13/6
BATTERIES IN CASES, complete with waterproof conducting cord, to work in conjunction with own lamps.

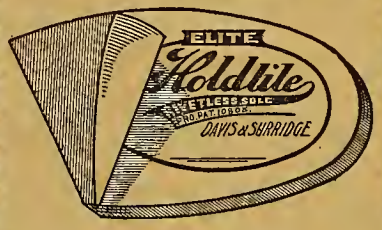
BOOT

REPAIRING

"Elite Holdtite Rivetless Soles."



Soles STUCK ON.—

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdtite Sol-fix solution. **We guarantee them to hold as firm as rivets or sewing.** This process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof.** Full instructions given with each pair of soles

THE WILD WIDOW

can be won by the aid of our **"Posh" Sidecar Bodies.**

Unapproachable design and finish—any colour you like or don't like.

They are luxuriously upholstered in shades which blend perfectly with the coachwork. They are **deep**, and deliver the comfort that, at present, you only dream about. Equipped with two pockets, a shelf, capacious tool locker, and apron.

Above all, they are **now** and always will be **actually in stock**, i.e., for the very moderate sum of Ten Guineas you can take one away **when you like.** Don't forget we shut at 1 o'clock on Thursdays.

Come and see the above; they are unlike anything you have ever seen before.

We have a 1914 **TRIUMPH** at **£65** and a 1915 countershaft, 3-speed, and hand clutch model at **£80.**

Both these are in perfect condition, and are covered by our guarantee.

(See Miscellaneous columns for other machines.)

MOTOR CYCLES FOR SALE.

Rover.

1915 3½h.p. Rover, clutch hub, Cowley speedometer, Lucas horn; following new, Dunlop tyres, belt, Miller's big set, pulley, engine bearings; overhauled, tip-top order; £60.—Gurry, Ditton, Cambridge. [5278

1919 (February) Rover 3½h.p., sidecar model, run about 1,500 miles, perfect condition, tyres unpunctured, insurance, spares; £100; seen by appointment; buying higher power.—Hubbard, 21, Earl's Court Sq., S.W.5. [4740

1919 4h.p. T.T. Rover, with flying Middleton sidecar, N.S.U. 2-speed gear and clutch, lamps, mileage about 600, fully insured; closest inspection welcomed; best over 105 gns.—Smith, Zaria, Finchley Rd., Westcliffe-on-Sea. [5226

ROVER, 3½h.p., T.T., 1916, Philipson pulley, machine and tyres as new, ridden about 1,500 miles, in store 2 years, full kit of tools, new spare tube and belt; privately owned machine, London district; no dealers; £70.—Box L4,223, c/o *The Motor Cycle*. [5481

ROVER Combination, 1914, 3½h.p., 3-speed, excellent condition, just been thoroughly overhauled by the makers, with wicker sidecar, horn, lamps, spares; £75, near offer.—Lt. Doelberg, R.N., at Squire's Garage, 86, London Rd., Forest Hill, S.E. [5080

1919 Rover Combination, 6h.p. twin, new March, complete with lamps, speedometer, spares, etc., special long exhaust and T.T. bars fitted, finish W.D. green, perfect condition; accept £140, or near; owner buying car; seen by appointment.—Brading, Cyprus, Chichester Rd., Croydon. [4780

ROVER 3½h.p. 1914 Coachbuilt Combination, stored during war, S.A. 3-speed, clutch, speedometer, 3 lamps, 2 acetylene generators, new hood and wind screen, plating and enamelling in good condition, spare belt, tools, very easy starter; after 6 p.m.—Allen, 187, Trinity Rd., Wandsworth Common, S.W. [5034

ROVER, 3½h.p. T.T., 1916 (late), with hand-controlled Philipson pulley, Senspray carburetter, largest P.H. head lamp fitted with Mangin lens, electric rear light, Klaxon horn, engine just overhauled by makers and specially tuned, enamel, plating absolutely as new; seen after 6.30 p.m.; price £75.—13, Arragon Gardens, Streatham Common. [5567

Royal Ruby

1916 Royal Ruby, 2¾h.p. J.A.P. engine, 2-speed, kick starter clutch.—Parker's, Bolton. [X3073

JONES' Garage, special agents for Royal Rubys, Broadway, Muswell Hill, N.10, and Woodside Parade, North Finchley. [2925

ROYAL RUBY, 1918, 2-stroke, 2-speed, free engine, fine machine; £40, first cash secures.—Ashton, Thornhill Edge, Dewsbury. [X2691

ROYAL RUBY 2¾h.p., 2-speed, countershaft, clutch, aluminium footboards, good running order; £47. —Houghton, Draper, Ely, Cambs. [X2816

ROYAL Ruby 2¾h.p., 2-stroke, Lucas lamps, horn, overhauled, good condition; £35; evening after 6. —King, 72, Albert Rd., Hendon, N.W. [5114

ROYAL RUBY 2-stroke 2¾h.p., in good condition, and perfect running order; £35.—Willis, 16, North Rd., Highgate, N.6. 'Phone: 457 Hornsey. [5173

A NEW Royal Ruby 2-stroke, with 2-speed gear, fitted with new lamp set and all accessories, splendid machine going cheap.—338, Coombe Lane, Bottom Copse Hill, Wimbledon, London. [5552

1919 Royal Ruby 8h.p. Combination, 28×3 tyres, delivery July, not done 700 miles, Grindley double sprung sidecar, wind screen, apron, lamps, horn, all tools; £170, nearest offer.—Rawlinson, 412, Audley Range, Blackburn. [X2881

Rudge.

RUDGE Multi 3½h.p., fast, good order; £45.—85, East Hill, Colchester. [5337

3½h.p. Rudge, Armstrong 3-speed; £42.—Tull, Falmouth, Kingsley Rd., South Harrow. [X8614

RUDGE Multi, late model, tip-top mechanical order; accept £63.—Grey, 57, Queen's Rd., Watford. [X2991

1913 Rudge Multi, 3½h.p., clutch, all accessories, reliable; £45.—Preston, Hawthorns, Berkhamsted. [X2729

RUDGE 3½h.p., clutch, splendid condition; £39/10; seen any time.—78, Springbank Rd., Hither Green. [5452

JONES' Garage, special agents for Rudge, Broadway, Muswell Hill, N.10, and Woodside Parade, North Finchley. [2926

1915 Rudge Multi Combination, 3½h.p., lately overhauled, mileage under 3,500; £85.—Lane, Abbots Leigh, Bristol. [5026

1917 Rudge Multi 3½h.p., clutch, Gradua gear, fine condition; £55.—499, King's Cross Rd., London, W.C.1. [5420

RUDGE Multi, 1913 3½h.p., perfect running order, new tyre and belt; £48.—Hickman, Wharncliffe Rd., Ilkeston, Derbys. [X2588

RUDGE Multi 1919 h. of M. Model, new condition; £105.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C.3. [0481

Impressions of the Trials.

WITHOUT a doubt both men and machines received a severe test during the trial last week. Difficult conditions are inevitable if the failures of a year's touring are to be brought out in a week's trial, and this accounts for the inclusion of such hills as the Hirnant Pass, Plynlimon, and Caio, whose surface would be considered unrideable by the average motor cyclist. The A.C.U. are to be congratulated on a thoroughly successful and well organised trial. The hard work which falls to the share of the officials is seldom appreciated by competitors, and only their shortcomings are given prominence. For this reason, it is particularly satisfactory to note that the only serious grumble was caused by the consistent driving test, which once again introduces the rider's ability to conform to the reading of a stop watch as a deciding factor in a reliability trial. Theoretically, this is not so, for it was presumably intended that each rider should do his maximum and minimum speeds at the start and at the finish, and by this means a good idea would have been obtained of how much power each engine had lost after a week's really severe gruelling.

Human nature is such, however, that practically every rider rode to a stop watch and left himself plenty of reserve both in fast and slow climbs so as to be able to repeat the performance at the end of the trial. As a matter of fact, many of the marks lost on the second test were due to the riders' failure to drive to a stop watch rather than to inability of the machine to perform its task.

Engines and gears have caused comparatively little trouble, and there have been but few retirements from these causes. Good weather favoured exposed transmissions, and neither chains nor belts have caused much trouble; but belt drives become less and less frequent, and the impression that belt drive is losing popularity, in spite of its advantages, becomes more and more fixed. Modern belts, it should be added, are far superior to those of pre-war days.

With some few notable exceptions, sidecar chassis show no very definite improvement. From two to six points of attachment were used. There is a noticeable tendency to make for extreme rigidity both in chassis and in couplings, but we would commend the idea of tackling the problem from an entirely opposite point of view.

Frames have withstood the severe test almost without exception, and spring frames saved their riders much discomfort. There are solo riders, however, who still maintain that no spring frame is as steady on grease as a rigid frame.

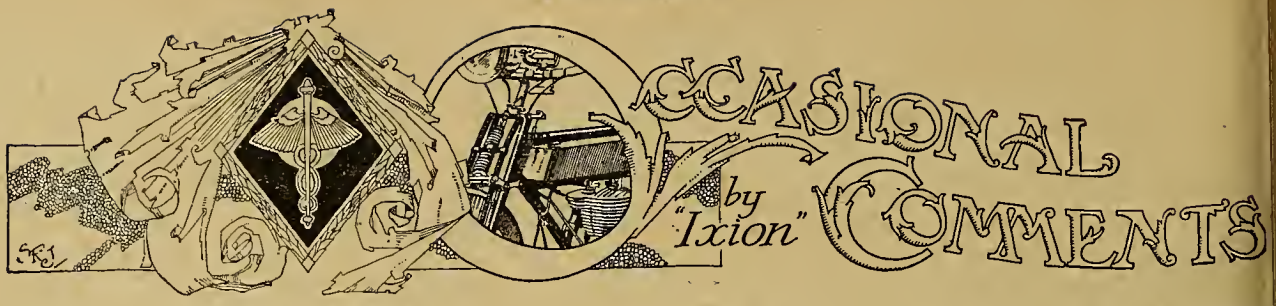
Perhaps the most unsatisfactory feature of the trial has been the prominence of tyre trouble. Admitting that the surfaces have been villainous, the amount of wear and tear at the conclusion of the trial and the number of bursts and punctures were particularly noticeable. True, all tyres cannot be tarred with the same brush, and one of the heavy combinations finished with its original covers in apparently almost new condition.

With regard to the capabilities of the complete machines, too much stress should not be laid on the number of failures on Bwlch-y-Groes. Surprisingly few riders knew the hill, and many displayed a lack of skill in handling their machines. It is certain that not one in a hundred machines in this country is ever put to a test even approaching the climb in severity.

One other important feature deserves more prominence. The A.C.U. Trials are intended to foster the best types of machines for public utility, and yet year after year some manufacturers fit special features, such as large tanks, improved brakes, larger tyres, and other items *to their competition machines only.*

We do not intend to raise the much-disputed question as to what comprises a standard machine, but surely some means could be devised to prevent the use of such extraneous fitments as deliberately nullify the object of the trial.

An Index to the advertisements in this issue will be found on the page facing the back cover.



King Charles's Head.

IN "David Copperfield" a weak but lovable character could never quite stop the martyr king's head from butting into his day-dreams. A reader recently hinted in our Correspondence columns that "accessibility" constitutes a parallel obsession in my own case. I wish that reader had been present in my garage this week. A wet spell inspired me to straighten a footrest which had been pointing to half-past seven ever since I forgot which way the throttle shut a few weeks ago. Blithely I tackled what, in my innocence, I mistook for a ten minutes' job (I have a vice, and had eke armed myself with a long piece of steel tubing, which looked a snuggish fit on the wayward spindle). When I got down to dots, I found that the back brake had to come off before I could dismount the footrest. Denouement No. 2 was the discovery that the exhaust pipe had to follow suit, which implied outing the crank case drain plug and a crank case bolt. I got the rest adrift at last, trued it up, and put it back, adding ten black marks against the 1919 designer concerned because a certain nut was so well fortified that I had to make a special spanner before I could shift it. The return journey absolutely exhausted my vocabulary, which represents a lifelong collection, acquired with much pains in several hemispheres. The only ways of getting the exhaust pipe right home were:

(1.) To bang it with a coal hammer.

(2.) To dismount the timing gear, and subsequently retime the engine.

The first method did not appeal to me, partly because the pipe was virgin as to its rotundity and cunningly plated; moreover, I intend to sell the machine shortly, and hammer dints on its pipe will provide buyers with a pretext for haggling with me. The mystery of the second method is accounted for by the fact that the pipe was a d.t.s. (trade term, "tight driving fit") between the magneto drive case and the crank case, and the rear half of the magneto chain case was cast in one with the timing cover. Have I justified my obsession?

One against Me.

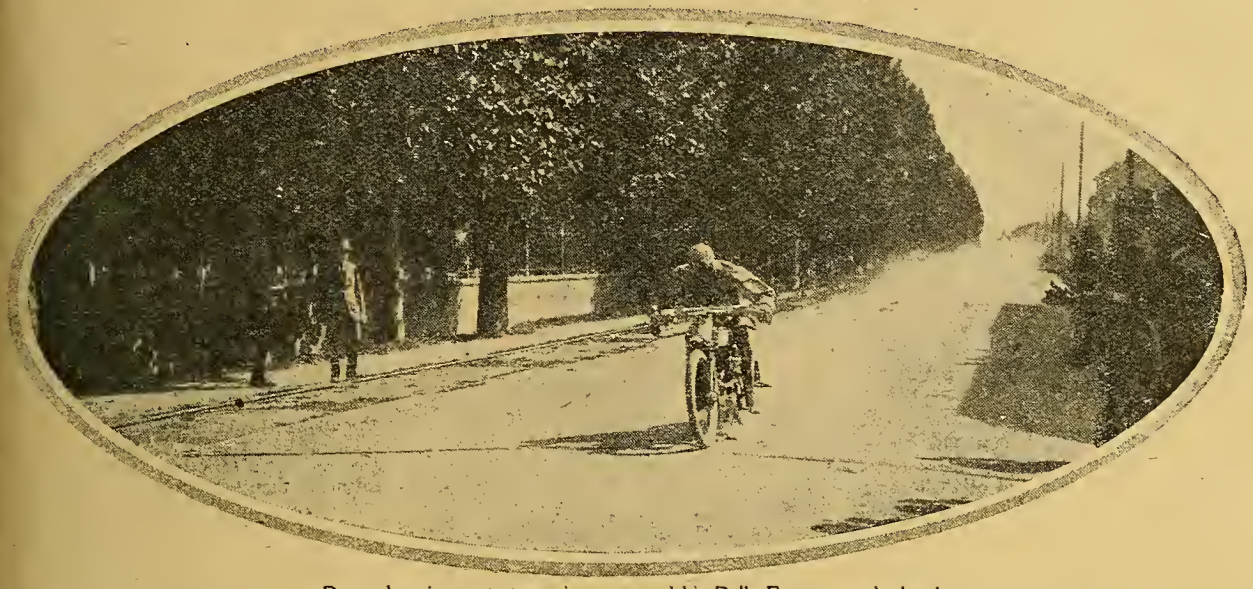
HOWEVER, the greatest of us have our temporary aberrations. During the heat wave my revbursts up-hill on public occasions were sometimes marred by the gear lever jumping into neutral. When one is doing fifty up a steep hill into a bottleneck of awed and respectful rubbernecks, nothing is more disconcerting than a sudden and violent deceleration of the road wheels, accompanied by a ferocious roar from the engine. So when it began well and truly to rain, I tackled this job also. I knew where the blame lay, or so I fancied. The selector rods of my gear box have hemispherical holes machined in them, one of which is chocked by a spring plunger when a gear is in. Each plunger spring is adjustable, so, methought, the mug who last fooled with my gear box had omitted to tighten up the second gear spring. Laying bare those springs is some job; the nuts on my gear box are as numerous as the rivets in a tank. When I got the accursed thing exposed, the spring was hard up, and the enthusiastic plunger had eaten its way clean through the head of its tunnel. This latter only affected me in so far as it raised the problem of reinserting the selector rod through a bearing which was now wholly blocked by an unleashed plunger. The real crux was that the locking device was not to blame for the gear jumping out. I slept on this problem. Wisdom came with the dawn. I must have coupled the gear lever to the selector in such wise that the second gear selector never registered its hemispherical hole with its spring plunger. And it was so. I need never have tampered with the gear box at all. Two turns of an external nut would have put things right. Further strains on my vocabulary.

Don't Worry the Trade.

I AM behind the scenes in some respects, and, therefore, appeal to readers not to bombard a maker with letters if an expected machine is far overdue for delivery. No words of mine can describe what firms have to put up with. I confess I can see no reason why steel and iron should be of inferior quality after the vast experience which the war gave us in producing these metals; but the fact remains that a great deal of stuff has to be rejected. When we come to partly or wholly manufactured components, stampings, forgings, tubing, castings, or parts bought ready for erecting, the case is widely different, for the suppliers have changed perhaps 50% of their labour since the Armistice, and many of the new hands have to be retrained. One concern was compelled to scrap 5,000 connecting rods last week. One can imagine what this implies, when thousands of pounds have been paid out weekly for eight months in wages, and for tools, material, and shop alterations, with never a farthing coming in. Just when mass erection is due to begin, and perhaps £10,000 a week should commence to replenish depleted coffers, the entire process of manufacturing is again held up. On the top of these troubles, the postman daily leaves a huge mail, most of which consists of vituperative enquiries about delivery, including one from a man who has ordered through a dealer unknown to the makers, who took three machines off a sub-sub-agent for a wholesale sub-agent, so that the firm has never so much as heard the name of either vendor or buyer. The only possible result of incessant importunity will be to tease honest firms into sending out unsound stuff rather than put up with these continued mortifications.

The Italian Motor Cycle Championship.

Lightweight and Mediumweight Events held Concurrently on the same Course. British Machine second in 350 c.c. Class.



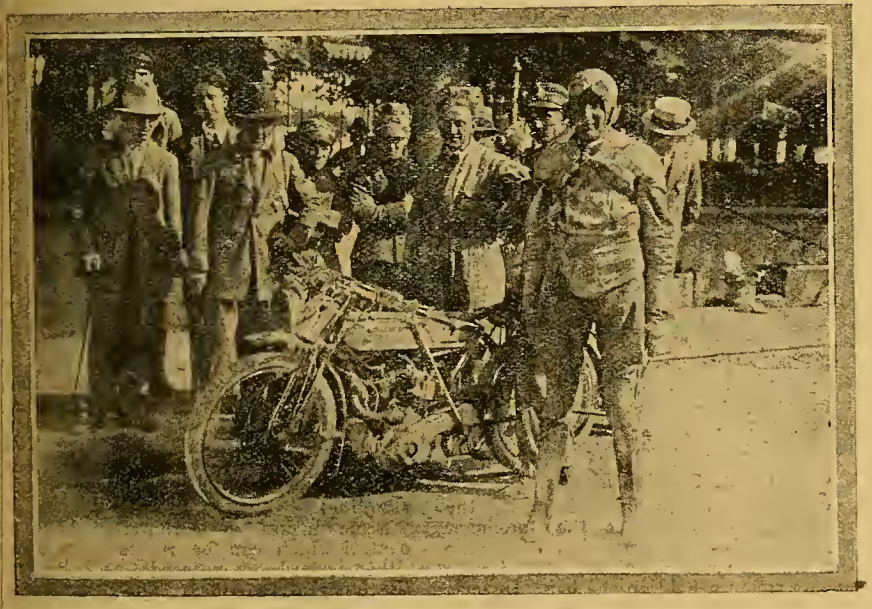
Dovo, the winner of the senior class, and his Della Ferrera, on the last lap.

THE Italian motor cycle T.T., the most important of the numerous races held yearly in that country, took place on September 7th, after five years' suspension, the last event having taken place in 1913, before the war.

The race was over the usual Cremona course, a triangle of straight, flat roads, the circuit of thirty-nine miles being covered five times, totalling in all 195 miles. The roads were not in very good condition, being very dusty. Dogs and chickens frequently strayed on the course, causing several spills, fortunately without serious consequences to the riders, but prejudicial to their chance of success. In other respects the race was well organised, and everything went well, sport being very good.

A Representative Entry

There were seven starters in the 350 c.c. class and 20 in the 500 c.c. class. The previous holders of the title for both classes—the Maffeis brothers—were both present, and hot favourites, although both rode in the senior class this time, but on different machines. The elder Maffeis (Bianchi) was eliminated in the first lap owing to belt trouble; and the other (riding a Motosacoche) dropped out in the second lap on account of his frame breaking, owing to the bad state of the roads, which caused many other retirements amongst the competitors.



The new record holder for the Cremona circuit: Dovo (Della Ferrera).

At 7.20 a beginning was made with the Junior class, the starters, at half-minute intervals, being as follows:

1. Sassi (Maffeis).
2. Bouasso (Douglas).
3. Baj Badino (Douglas).
4. Pozzi (Motosacoche).
5. Gianolio (Douglas).
6. Pregliasco (Douglas).
7. Antoniazzi (Douglas).

Pregliasco's Douglas was fitted with all-chain drive, but was not successful owing to transmission trouble.

After twenty-five minutes' interval the riders in the senior class were sent off, also at half-minute intervals, in the following order:

1. Bordino (Motosacoche).
2. Rossi (Motosacoche).
3. "Beppi" (Senior).
4. "Cinque" (Triumph).
5. "C.P." (Borgo).
6. Borgotti (Fongri).
7. Lt. Guzzeloni (Frera).
8. Dovo (Della Ferrera).
9. Merlo (Frera).
10. Sergt. Ruggeri (Sunbeam).
11. Gnesa (Motosacoche).
12. Groini (Maffeis).
13. Genzini (Triumph).
14. Acerboni (Frera).
15. Castagneto (Frera).
16. Nosenzo (Della Ferrera).
17. Maffeis, jun. (Motosacoche)
18. Sergt. Russo (Sunbeam).
19. Sergt. Amerio (Sunbeam).
20. Maffeis, sen. (Bianchi).

Maffeis, junior, made a very fast start, creating great enthusiasm amongst the concourse of spectators, as did Dovo, who rode a twin-cylinder Della Ferrera, of the four-speed, four-chain type. The gearing of this machine is curious, there being two chains from the engine to countershaft and two from countershaft to driving wheel, all enclosed in oil bath chain cases. Three despatch riders on Sunbeams were amongst the starters.

Twelve minutes after the last riders had been sent off, Pozzi (Motosacoche) arrived in fine style having completed his first lap in 48m. 31⅕s. This proved

The Italian Motor Cycling Championship.—to be the fastest lap of the day on the small machines, his speed being 48½ m.p.h. Baj Badino (Douglas), the favourite, lost much precious time on account of a rather bad fall caused by a dog.

Before all the competitors in the junior class had finished their first lap, the first starter of the senior class, Bordino (Motosacoche), had caught them up, and even passed some of them, despite the twenty-five minutes interval. This rider accomplished his first lap in 41m. 1⅕s., but barely had two minutes elapsed when, to everyone's great surprise, Dovo (Della Ferrera), who had started 3½ minutes after him, also passed at great speed, going in fine style. It seems a strange coincidence that in the two classes the eventual winners both secured the front position right at the first circuit, in which they both completed the fastest lap of the day in their respective classes. Dovo's time for the lap was 39m. 37⅕s., a speed of nearly 60 m.p.h.

Frame and Fork Breakages.

All the riders of the junior class completed the first lap, but two of the senior class dropped out. At the beginning of the second lap Maffeis's accident happened, and he had to be taken to the hospital, his hands and face being rather severely cut. One of the despatch riders also retired owing to his front forks breaking.

In the second lap another four riders retired; the pace and the bad state of the roads beginning to tell on both riders and machines. The position of the first four in each class remained the same, however.

The third lap began to see a few changes for the first places; the leaders remained the same, but Baj Badino (Douglas) had gained on Sassi (Maffeis) in the junior class, robbing him of second place, whilst in the senior class Gnesa (Motosacoche) from the thirteenth position, which he held in the first lap, gained consistently on all riders but the first, by running eighth in the second, and fourth in the third, taking the place of Merlo (Frera), who had been in that position since the start. Gnesa, who had been very unfortunate owing to various minor troubles in the first lap, made a splendid effort and arrived second.

He finished just a minute ahead of Borgotti (Fongri), who would have been second, as Bordino (Motosacoche), who had held that position for four laps, had dropped back, if he had not punctured in the last lap. This rider rode most consistently, keeping in third position for the whole race.

Leisurely Replenishments.

In the meantime two riders had dropped out in the junior class, and a further three in the senior class.

Between the third and fourth lap most of the competitors stopped for replenishments, but, contrary to British custom, no time-saving devices were employed to effect lightning refills of the tanks. In fact, most of the competitors seemed to find time to get themselves snapped by the photographer during the refilling operations.

Baj Badino (2¾ h.p. Douglas), who ran second in the junior class, approaching one of the level crossings.

The finish was anxiously awaited, and as the time went on comments were being made on the fine performance of the probable winner Dovo, and all eyes were strained down the road waiting for him to appear.

This he eventually did, finishing very fast. Bordino, who should have been the runner up, was expected about twelve minutes later, but in his stead, after some delay, Borgotti arrived, and looked like taking second place until Gnesa came along shortly after, having covered his last lap in five and a half minutes less than the previous rider, who arrived only four minutes in front of him. The former thus gained second place by approximately one minute, Bordino being fourth, and six others in the following order:

		h.	m.	s.
1.	Dovo (Della Ferrera) ..	3	32	34⅘
2.	Gnesa (Motosacoche) ..	3	58	52⅘
3.	Borgotti (Fongri)	3	59	59⅘
4.	Bordino (Motosacoche) ..	4	11	37⅘
5.	Merlo (Frera)	4	11	47⅘
6.	Acerboni (Frera)	4	13	14
7.	Grioni (Maffeis)	4	34	10
8.	Ruggeri (Sunbeam)	4	37	9⅗
9.	Castagneto (Frera)	4	38	27⅕
10.	Nosenzo (Della Ferrera) ..	4	58	44

The average speed of the winner was 55.25 m.p.h., beating the previous record for the course.

The results of the junior class were as follows:

		h.	m.	s.
1.	Pozzi (Motosacoche)	4	21	52⅕
2.	Baj Badino (Douglas) ..	4	29	17⅘
3.	Sassi (Maffeis)	4	34	0

The average speed of the winner in this class (44.85 m.p.h.) is lower than that made by Maffeis, jun., on a Douglas, who holds the existing 350 c.c. record.

The team prize in the senior class was won by the Frera team, who had three finishers' places as follows: fifth, sixth, and ninth. Merlo and Castagneto rode the usual single-cylinder model with side-by-side valves, whereas Acerboni had a special twin model.

Italian Machine Wins.

Dovo wins the Head Cup for the fastest time of the day, and his success in the most important Italian road race reflects great merit on his mount, the Della Ferrara, which, in spite of its speed, had been most unfortunate in competitions this year, owing to falls or minor troubles, which have nothing whatever to do with the excellence of the machine.

Borgotti did not ride the usual flat twin Fongri, but a special racing machine with a V twin engine. The two Maffeis machines, with Jap engines (one in the junior and one in the senior class), did very well, finishing third and seventh respectively. Baj Badino on his Douglas with better luck would have won in his class.

Everything considered, the event was very successful, and the entry the largest attained this year for any road race or hill climb.

Standardisation of Controls.

Should the Carburetter Levers open Inwards or Outwards?

FOR some years there has been a wide diversity of opinion and practice which exists in the arrangement of carburetter controls on the motor cycle handle-bar Undoubtedly it is desirable that carburetter makers come to some arrangement by which the controls are standardised so far as the direction in which they operate is concerned. Below are given some strong reasons in favour of levers made to open outwards, and the disadvantages of the "inward" movement are discussed.

Levers Opening Outwards.

The case for the control levers opening outwards when fixed on the right handle-bar is a very strong one, as the right thumb moves the levers outwards, and is amply strong enough to compress the control springs while the fingers retain a safe hold of the handle-bar. When closing the levers, the thumb holds the handle-bar, while the forefinger has a wide reach, and the movement is assisted by the relaxing of the springs.

Levers Opening Inwards.

When the levers open inwards, the reverse is the case, as the forefinger has but a limited range inwards, while the thumb, second, third, and fourth fingers retain a hold on the bar. In fact, it is difficult to open some levers inwards with the point of the forefinger: it has to be done by the first joint or even the knuckle.

The opening outward movement therefore appears to be anatomically correct, and this should certainly be taken into consideration by the designers of carburetter control levers. Standardisation should follow on anatomical lines, and should not be governed by previous mistaken practice, even of many years' standing.

Some makes of carburetter have a control which can be reversed, to open either inwards or outwards, according to the fancy of the rider. The Senspray is one of these. V.A.H.

A PROLONGED TRIAL.

Some Details of the Equipment of the Two Sidecar Outfits which are going through the A.A. 5,000 Mile Benzole Test.

At Towcester. The two Triumph outfits undergoing the A.A. 5,000 miles National Benzole Test. Very complete equipment is provided.

WHEREVER the two smart-looking 1920 chain-drive Triumph-Gloria outfits, with their black and yellow "5,000 Miles National Benzole Test" notices displayed, come to rest, an interested throng of spectators always gathers. Admiration is invariably expressed not only for the workmanlike finish of the machines themselves, but also for the completeness of the fittings and accessories.

Filling the tank with a measured quantity of benzole. A special graduated brass cylinder is employed for this purpose.

The severely practical part of the organisation of the run has largely devolved upon Mr. W. Smith, who is assistant to Capt. Allen, the fuels manager of the A.A., and it must be admitted that he has very thoroughly dealt with his task.

To Determine Consumption.

One of the first essentials was the provision of a means of accurately measuring the supply of benzole into the tanks. For this purpose a half-gallon brass cylinder fitted with a delivery tap at the base was made. This measure is graduated into half-pint divisions and arranged to receive a disc of filtering material at the mouth. Next to measuring the spirit is the necessity of ascertaining the actual distances covered. This is done by means of Smith speedometers, which appear to be more than ordinarily satisfactory, maintaining the needle steadily at normal speeds on all except the most "pot-holey" roads.

As a further precaution against incorrect estimation of fuel consumption, the tank filler caps are locked, the key being in the possession of the driver, so that no replenishments can be made without his knowledge. The locks are soldered on to the tank in such a way that the bolt passes sideways into the filler cap.

Lucas accumulator lighting sets are fitted to both outfits, and although it is not intended to do a great deal of night riding, an examination of the bulbs and accumulators at the conclusion of the total distance will be interesting.

In order adequately to secure the comfort of the observers, Easting windscreens are attached to both the sidecars, and but little increased wind resistance appears to result from their use.

A word may be added regarding the motor cycles and sidecar themselves.

These are both chain-driven 4 h.p. Triumphs, combined with Gloria sidecars. The test machine has the new type enclosed fork spring with damping device and a rigid wheel sidecar, while the tender is equipped with the normal type fork spring and the usual Gloria spring wheel.

The Motor Cycle in Portugal.

A Field for Development in Western Europe.

DURING the present period of trade re-establishment British manufacturers might well look towards an almost untouched market which is remarkably near home.

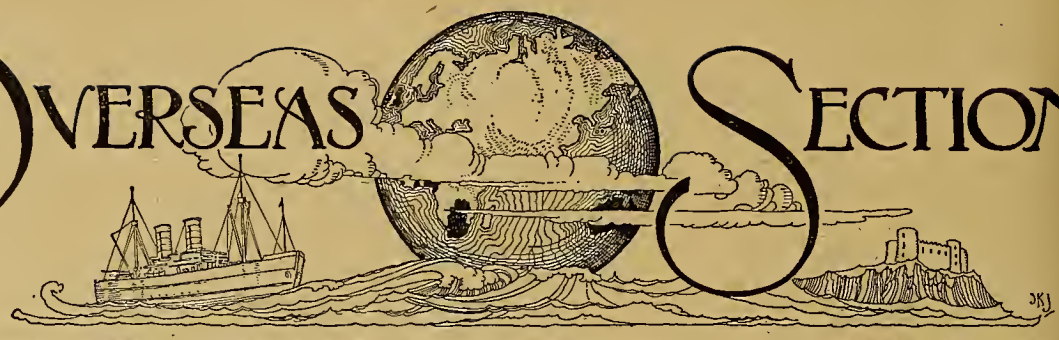
At present the local demand is inadequately met by American products, and there is a moderate and steady *clientèle* awaiting the opportunity of placing orders with any firms able to give satisfactory service. The country of which we write is Portugal, one of our Allies during the war, and always disposed towards us in a friendly manner. The following notes from an ex-officer of the British Army now resident in the capital there are of much interest:

"Portugal is wonderfully mountainous. Every day I ride over roads that make the average club trial look like an afternoon run round Piccadilly in a 'flivver,' and this fact must be remembered when considering what type of machine to send here. Considering the number of people of the class who buy them, motor cycles are extremely popular here, and were there sufficient machines available the existing number would be doubled and trebled. The Portuguese branch of the Vacuum Oil Co. is supplying ample petrol and oil for all purposes at a price about the same as that obtaining in England. Practically all the machines here are American big twins (Harley-Davidson, Excelsior, Indian, and Reading Standard in order of precedence). The sidecar is so popular that solo machines are, comparatively, rare, this being due, I think, to the excessive weight of U.S. machines for solo work and the absence of medium weight solo machines.

"I consider that there is a tremendous opportunity for British makers if represented by live agents. The following types should sell well: (1.) Medium weight three-speed and clutch solo machines, *e.g.*, Norton, Triumph, etc (2.) 6-8 h.p. sidecar outfits, *e.g.*, Matchless, A.J.S., Enfield, etc. The spare wheel on sidecars is not known here, and would prove a tremendous selling point. The Portugee likes folk to hear him coming, so plated T.T. exhaust pipes are greatly to his taste, while bright colours are also popular. All owners seem to be unmechanical, and very rough and ready drivers, so machines should preferably have automatic oiling systems and one-lever carburetters.

"This is a magnificent and little known country to tour—why cannot some of our salesmen come out and combine a little business with pleasure?—F. S. ROWE."

OVERSEAS SECTION



A Commentary based upon Practical Experience and a Study of Overseas Opinions.

Transmission Problems.

SPEAKING widely, three separate and distinct systems of transmission are in vogue in motor cycle construction to-day, viz., the all-chain, chain-cum-belt, and the unit construction by which the drive is conveyed from the engine to the countershaft by means of pinions, and thence to the rear wheel by single chain or belt. Each system has something to recommend it, though the latter appeals to the mechanical mind as the most thorough and permanent job.

All-chain drive is quite reliable, and, given a good clutch, it lacks little from an engineering point of view. Its installation, however, sometimes brings in its train objectionable features which are difficult, but not impossible, to obviate. These disadvantages are largely of an external character and may be summarised as follows: The chain from the engine to the countershaft must necessarily be enclosed, and in many instances the cases are unduly bulky or inaccessible, while annoying rattles often arise. Many Overseas riders dispense with them, thereby exposing to grit and water all sorts of comparatively delicate mechanisms which were not designed for such exposure. This may apply in the main only to the more shoddily made chain cases, though we have known the best of them to suffer sorely in trials of exceptional severity. Also there is the remote though ever present possibility of a broken chain resulting in a smashed case, it being borne in mind that the life of a chain is decided entirely by the speed at which it runs. For this reason the engine-shaft chains begin to show wear early, though being subject to less strain than the rear chain it does not follow that they are the first to break.

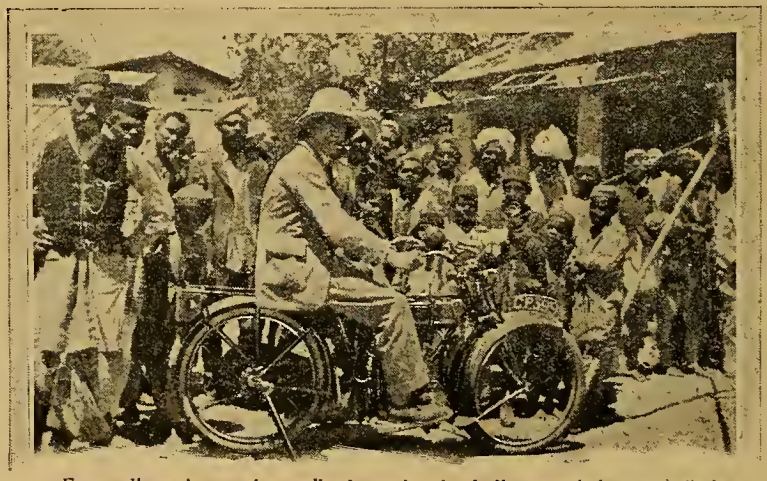
Under absolutely ideal conditions chains do not wear indefinitely, and if this system of transmission can be superseded by one which is permanent a very large step in the direction of perfection is accomplished, the cost of maintenance having at once been considerably reduced. There is no mechanical reason why the transmission of a motor cycle should not be as permanent as regards wear as the power unit. In the case of cars this is so; the days are gone when car owners were confronted with the expense of new chains every few hundred miles, this item being tacked on to such inevitable expenses as tyre renewals; and what applies to the car to-day will undoubtedly apply to the motor cycle five years hence.

❁ ❁ ❁

Virtues of the Belt.

THE unit system with final belt or chain drive is, then, to be highly commended as a step in the right direction. It eliminates the high-speed chain, and renders possible the use of a small rear wheel sprocket, so that, if an oil-retaining chain case be used, it can at any rate be of modest dimensions. The clutch, shock absorber, etc., are contained in an oil-tight housing behind the engine, always perfectly lubricated, presenting no unsightly protrusions, and economising space, while for those who object to the chain case the simplest type of chain shield would give reasonable satisfaction. It is possible for the rider to carry with him a complete chain which can be put on in a few seconds in case of breakage—a very favourable comparison with the case of a machine where such renewals entail the movement of both gear box and chain cases.

The unit system is not, of course, confined to the final chain drive, and has been adopted by one or two makers of lightweight machines in conjunction with belt drive to the rear wheel. For a light machine it would be difficult to devise a more ideal system. The belt is clean to handle, and its use obviates the employment of a shock absorber, which latter is not always an unmixed blessing. The final belt drive is cheap and simple—cheap not only in itself but also as regards



Extraordinary interest is usually shown by the Indian population generally in the motor cycle, and in the large towns there is a big market for a cheap machine. The photograph of the 2¾ h.p. A.J.S. was taken at the hill station, Raniket (United Provinces), 6,400 feet above sea level.

Overseas Section.—

tryes, though its limitations are confied to solo mounts, and preferably the lighter order of these. The old nuisance of belt slip, which alone accounts for the present popularity of the chain drive does not occur in the modern lightweight machine, proper precautions having been taken to shield the belt from oil and water, and we have ourselves ridden in the most strenuous trials, over terrifying gradients, and through truly appalling weather, on belt-driven lightweights, the transmission systems of which gave no trouble whatever throughout such adverse conditions.

Our summing up, then, is in favour of the unit system with final belt drive so far as the limitations of the belt extend, after which the final chain takes its place.

⚙ ⚙ ⚙

Possibilities of the Shaft Drive.

THE shaft drive is, of course, the ideal, and one fails to see what is the real obstacle in the way of its sluggish development. The system is as old as the hills, and any experienced engineer could lay out a shaft drive design as silken and compact as any of our existing transmission systems, and infinitely more permanent. As to whether he could adapt it attractively to the orthodox type of motor cycle is quite a different matter, for one of the chief difficulties lies in obtaining the necessary alignment without producing a lop-sided and overhung effect and a corresponding lack of symmetry in weight distribution. Probably the chief reason why the shaft drive is not seriously tackled by the more influential manufacturers is because they possess a very good thing in their present designs, and an innovation of this kind would necessitate an entire departure from old and well-tried principles, *i.e.*, in adapting the shaft the majority of makers would be called upon entirely to remodel their productions and to depart from many of the principles which have played no small part in the making of their businesses.

One cannot help feeling, however, that the shaft drive will inevitably come when motor cycle engineers are ready for it, and until then the unit construction appeals to us as a very desirable step in the direction of ultimate perfection. Perhaps its advent will entail a revisal of engine design.

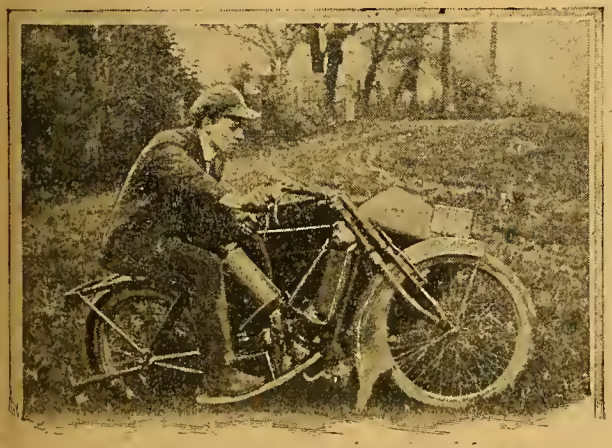
A Selection of Letters from Readers scattered all over the World.

British Motor Cycles.

C. F. GILL, writing from Rangoon, Burma, says: "I have seen people writing from time to time as to the superiority of foreign motor cycles over British. I have ridden considerably in India and Burma, over roads (!) of all degress of rottenness, and my experience has been that a British machine can stand far more hard wear than the products of other countries. There are many 1911 Triumphs here still going strong, and up country in a quite small village there is a Triumph 1911 engine being used for pumping purposes; while foreign motor cycles only two or three years old are well past their prime."

A 5 h.p. Mount on Scott Lines Wanted.

"R.M.," writing from Toronto, speaks highly of the Scott and Triumph: "The Scott combination, a photograph of which I am sending, has been running since 1913, and has given exceptionally good service. The only spare parts that have been fitted to the motor are two piston rings and new gaskets. I think this will take some beating. I am glad to tell you that the Triumph is going well. This machine, as you probably know, built up such a reputation that, after an absence of over four years, the Americans with their big twins could not freeze it off the market. I think it goes to prove that if the British machines were exploited properly there is no doubt that they could 'clean up' the field. My ideal machine would be a big Scott, big tyres (3in.), 28in. wheels, 5 h.p. motor, three-speed, and, if possible, a shaft drive and interchangeable wheels, and, last, some brakes that will stop the machine."



A Scott outfit which is giving good service in Canada (see letter from "R. M.")

Cultivate Indian Trade.

"C.E.F-M.," writing from Delhi, India, says: "As one of your readers abroad, I should like to thank you for the Overseas Supplement which appears from time to time. Might I make the following suggestions for the benefit, not only of your Overseas readers, but also of the manufacturers who advertise in your paper?

"First, it has always been a mystery to me why more English motor cycle manufacturers do not cater for Indian and Colonial trade. It cannot be said that the English motor bicycle is not suited for the Tropics. But it is a fact that there are not more than half a dozen different makes of motor bicycles in India. Before the war, even, one had to take what one could get when one wanted to buy a new motor bicycle. I have always longed to see, in the large garages in Bombay and Calcutta, two or three machines of different makes on show. One hears that these garages out here are agents for this or that machine, but they rarely have any machines in stock.

"Might I suggest, therefore, that the manufacturers might persuade their agents in India to keep up their stock so as to have one always on view? Also, it would improve trade if manufacturers would not only publish the names of their agents out East, but also publish the retail price of their machines in the various countries.

"I should be glad to hear that agents had been found for a large number of English machines which heretofore are unknown out here—A.B.C., Brough, Hazlewood, Norton, Matchless, Blackburne, etc.

"As regards the type of machine most suitable to these parts, if the following few points were embodied in any good English motor bicycle there would be no doubt about the suitability:

"(1.) Spring frame.
"(2.) Large size tyres.
"(3.) Easily detachable wheels.
"(4.) Simple engine, with its tappets, timing gear, and magneto accessible.
"(5.) In the case of the combination, detachable and interchangeable wheels, ample locker room for extra petrol and oilcans.

"I fear I have been somewhat long-winded, but am anxious to see more English motor bicycles out here and fewer foreign ones."

3,000 Miles on a Single Cylinder Sidecar.

Some Particulars of the Service of a Satisfactory and Hard-worked Outfit.

CAN anything but a big twin prove satisfactory as a sidecar propellent? How often in varying forms is this question asked? It reminds one of the old query, "Can a fellow live in Town on five thousand a year?" It all depends on the fellow. So it is with the single-cylinder motor cycle of reasonable dimensions. It all depends on the machine.

The following brief narrative will show that, as regards the Triumph, at all events, no fears need be entertained that the power of the 85 × 97 mm. (550 c.c.) single-cylinder engine is insufficient for serious sidecar work.

The 1919 Triumph 4 h.p. single-cylinder sidecar outfit, on which the writer has covered 3,000 trouble-free miles.

The Outfit.

It was a hard struggle last spring to get something to ride, and the writer was all the keener to get on the road, as he had just been demobiilsed from a non-motoring branch of the services which had claimed him for the previous three and a half years. But just before Easter he successfully extracted a 4 h.p. Triumph and Gloria sidecar from the Triumph Cycle Co., Ltd., and one, moreover, equipped with a Lucas accumulator-fed electric lighting outfit, which has proved as entirely satisfactory as one has the right to expect from products of that famous firm of lamp makers. The current is supplied by two large forty-amp. hour accumulators, carried in the boot of the sidecar in a polished box, and the lamps are a light car type head lamp, an egg-shaped sidecar lamp, and a red tail lamp on the cycle carrier. It has been found necessary to have the accumulators charged every six weeks, and if this is done a flood of light is available at any time. The relief from the messiness of acetylene is so great that once used it is impossible to conceive of anyone forsaking electric light. The rest of the special equipment consisted of a hand Klaxon—a far better road clearer than the ordinary bulb horn, and a Cameo windscreen, which has proved most useful when carrying a child in the sidecar, or in windy weather. Up to the time of writing, the outfit has had the extraordinary good fortune to have covered just over 3,000 miles without ever having been out on the road in a rainstorm.

Although the power unit is apparently the same as that supplied on the 1915 Triumphs, it is very evident to anyone acquainted with both models that a very great advance has been made in the way of giving greater power output, and the lessons gained by supplying huge numbers of machines to the War Departments of the Allies have evidently been put to practical use by the makers. Not only is the 1919 Triumph engine a good puller—it is also a rare sticker. In fact, if one was asked to name any particular virtue of the engine, it would be that on a run of two hundred miles on a generous throttle opening, the two hundredth mile would be covered as stoutly and as with as much determination as the first. A first-class twin is a delightful mount, but the writer has yet to meet with a twin-cylinder engine with quite the same ability to keep its tune under pressure as does a first-class single.

Fuel and Oil Consumption.

When delivered the Sturmey-Archer gear box was fitted with the early 1919 quadrant, but owing to the fact that every time the carburetter was flooded the lubricant in the quadrant was washed out, which meant constant renewal of the lubricant to ensure easy gear changing, the latest type of quadrant fitted high up just under the rear end of the tank was substituted, with marked improvement in the general convenience of the driver. For the first 2,000 miles a careful record of petrol and oil consumption was kept. The machine has covered the whole of its mileage with the sidecar attached, and has often carried three, and on some few occasions four, people. The fuel consumption (benzole was used whenever obtainable on the same carburetter setting as for petrol) for the first 2,000 miles worked out at exactly 71 m.p.g. The best results were obtained with a half and half mixture of benzole and petrol. Knocking was then impossible, and very easy starting and rapid acceleration were experienced. The last 1,000 miles was covered on a holiday jaunt from the Midlands to the far West of England and back, and no record of consumption was kept. Oil has always been used rather freely, Prices' Motorine C being employed, and a quart has invariably been consumed every 200 miles.

3,000 Miles on a 1919 Triumph Sidecar.—

Not a single involuntary stop has been made, and not a single adjustment to either machine or sidecar has been necessary. The cylinder and valves were deliberately not removed for 2,000 miles, when the makers took these down and reported that although there was considerable deposit, it was quite soft (chiefly owing to the large use of benzole), and that the valves and seatings and bearings were in perfect order. The writer continues to ask for and use it whenever obtainable. Extraordinary luck (or good service) has been experienced from the 26 × 2⅜ heavy studded Dunlops. Up to the present not even a solitary puncture has been experienced, though the post-war roads in many parts are hardly propitious to long tyre life. The back tyre is, of course, worn down past the studs, but the fabric appears perfectly sound and good for some miles yet. The general finish of the outfit is what one would expect from a combination of Triumph and Gloria companies, though one would fain, perhaps, have a little less glitter and consequently less to keep clean.

The hill-climbing powers are remarkable. Edge Hill can be climbed on second speed with an eleven stone passenger, and steep hills were taken on the run during the trip to the west of England. Indeed, it would appear that so long as the back wheel can obtain a grip, the hill must come off second best when attacked by a modern Triumph sidecar outfit.

The Triumph provides in abundance one quality which, after all, is the bed rock of motoring, that is reliability. M.S.

The Question of Spares and Replacements.

Notes contributed by the Repairs Manager of a Leading Motor Cycle Factory.

"GIVE us a good repair service." Such is the cry of the whole of the motor cycling world. The writer has had fourteen years' practical experience in controlling the repair service of one of the leading motor cycle concerns in this country, and will endeavour to deal with this all-important question both from the rider's and the manufacturer's point of view. It certainly seems that, in many instances, the manufacturer rather loses sight of the vital importance of this side of his business.

It is undoubtedly a great asset to the purchaser of a motor cycle to know that if anything *should* go wrong, it will be made good without any fuss or quibbling; and that the maker's guarantee is not a mere scrap of paper.

It behoves the manufacturer to place a liberal and fair interpretation upon his guarantee, and even if he should occasionally give the rider the benefit of the doubt, and thereby lose a few shillings, it redounds to the manufacturer's credit over and over again in creating an enhanced reputation for fair and dignified business methods, together with an augmentation of goodwill.

There is a type of individual—fortunately rare—who complains for the sake of complaining. But the manufacturer, or his representative, can readily discriminate and note the case for future guidance.

Insurance.

Most motor cycles nowadays are insured, and here again it is most important, in the interests of the trade generally, that manufacturer, agent, rider, and insurance company alike should act harmoniously and deal quite fairly with each other in handling the frequently recurring questions and claims which arise in connection with insurance matters. A few words of praise the writer feels constrained to express in regard to insurance companies. In the whole of his experience, extending over hundreds of cases, he has never known an insurance company to hesitate or quibble over any claim presented by the manufacturer in a fair and straightforward manner upon the rider's behalf.

A great deal of disappointment, delay, and unnecessary trouble can be avoided in many cases by riders taking care to be precise in the orders or instructions which they give manufacturers for spares or repair jobs. An order will arrive, for instance, reading "One fork spring." It is, perhaps, needless to point out that there are various types and patterns of fork springs appertaining even to one make of motor cycle; and, considering that manufacturers are continually striving after perfection, many alterations and changes take place within a comparatively short time. It is therefore essential for a rider to give supplementary information upon all occasions as to the type of machine he has—its number, and, approximately, the date or year of the model, otherwise a query must be raised entailing delay in attending to his requirements, or, at best, a mere guess only can be made.

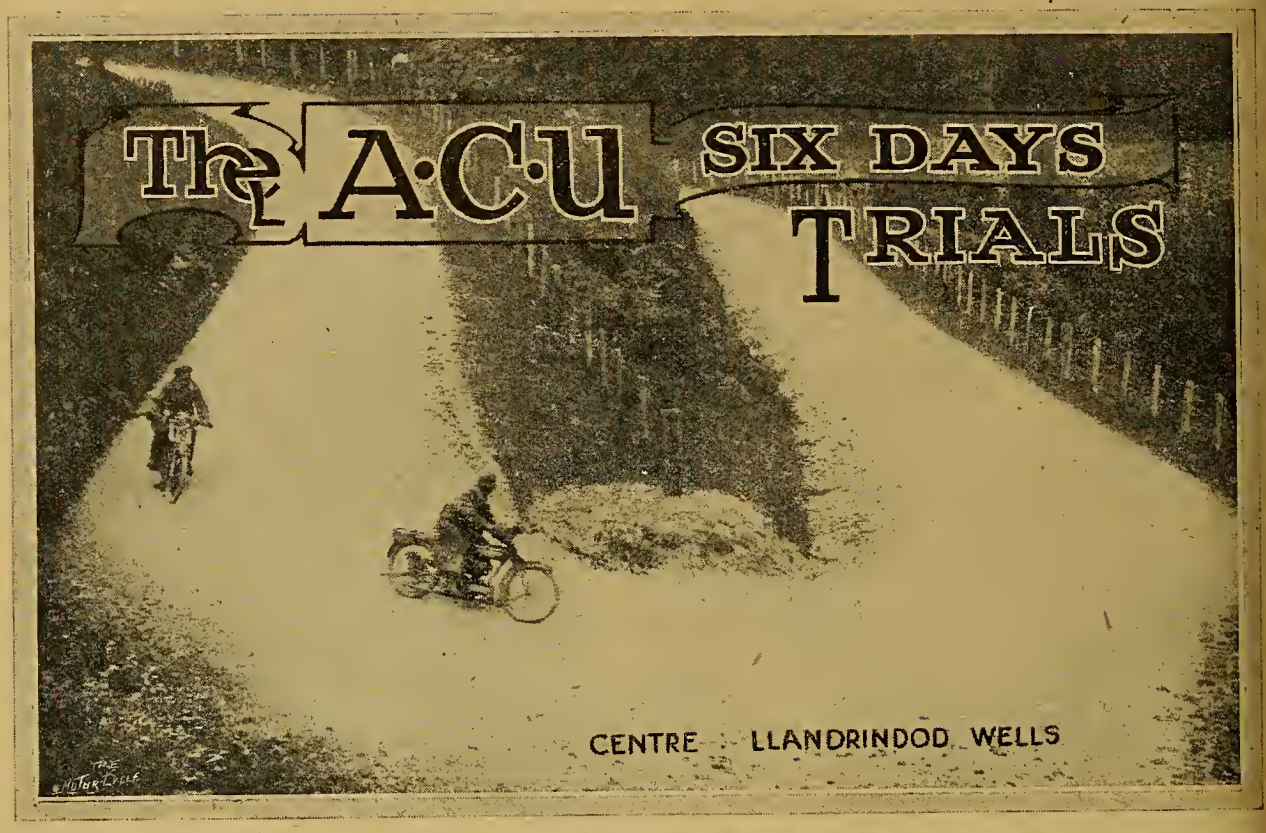
A Brass Band!

Upon one occasion, the writer recollects receiving an order for "one brass band." One felt disposed to ask facetiously "How many performers?" By the exercise of that wonderful amount of gumption which all manufacturers and their loyal staffs are expected to carry, he eventually divined that it was a phosphor bronze ring or band that was required; it being a hub component.

It is very necessary in every rider's own interest that he should endeavour to thrash out as many points as possible for the benefit of his own information. Such intelligence, when once gained, is frequently of tremendous assistance when out on the road or if momentarily "hung up"; but manufacturers generally exercise the greatest amount of patience and courtesy in answering questions.

There are certain firms in the trade who habitually deal with the repair and replacement question in a prompt and most business-like fashion. They never split straws over a few shillings, and one feels the utmost confidence all the time in strongly recommending their manufactures. Other firms one could name, while aspiring to great popularity, do not give the care and attention to the needs of the public.

Many manufacturers would do well to take a leaf out of the book of our American cousins in this department of their business F.C.J.



Capt. A. Lindsay (4 Norton) and T. Peck (3½ Ariel) negotiating a hairpin bend in Glen Elan.

IN last week's issue we described the first day's run of the Auto Cycle Union's Six Days Reliability Trials, with Llandrindod Wells as a centre over a course of 732½ miles, embracing most of the noted Welsh mountain tracks and precipitous hills. Monday's run consisted of a 98½ miles trip *via* Garth and Brecon to Abergavenny, the return being by way of Crickhowell, Talgarth, Erwood, and Builth.

The names of 115 competitors were given in the official guide, and of these only the following five competitors failed to start: J. R. Lane (2¾ Douglas), C. Hartwright (2¾ New Imperial), Lt. L. de Aranjo (7-9 Harley-Davidson), W. Elce (5 Zenith), and H. A. Leak (7-9 Harley-Davidson). E. W. Merrall (8 Morgan) was a late entry.

On Monday the first part of the consistent driving test was held on Panne Hill. This was repeated on Friday, the last day of the trial, Saturday, this year, being devoted to a careful scrutiny of the condition of the machines, an important point in the final classification.

The consistent driving test was not popular with the competitors, who considered that it was rather a test of the driver than the machine.

Of the 111 competitors, the splendid total of 110 survived the first day's trip, the absentee suffering an unfortunate collision on a bend with a Ford car. The lamp test on Monday evening from Abergavenny home (40¾ miles) caused little or no trouble, thus banishing the fears of some competitors—and some manufacturers—that possibly lamp failure might entirely spoil the otherwise good record of a machine. Quite a number of machines were fitted with dynamo lighting sets, including the new Lucas Magdyno, while dry battery and accumulator equipment were much in evidence.

The clock outside the official garage, with the competitors' numbers arranged around the dial, indicating their starting times.

TUESDAY'S RUN OF 160¼ MILES.

Llandrindod, Howey, Newbridge-on-Wye, Llanafan-fawr, Garth, Llangammarch, Llanfair-ar-y-bryn, Llandovery, Llanwrda (brake test), Llansawel, Llanbyther, Bronwydd Arms, Conwil Elvet, Newcastle Emlyn (lunch control). Newcastle Emlyn, Aberayron, Cross Inn, Ystrad Meurig, Yspytty Ystwyth, Head of Elan Valley, Rhayader, Llandrindod.

The best of weather again favoured the trial, and, thanks to excellent organisation, the competitors got away well up to time, and Llandrindod was left by the same road as on Monday, but a mile or two out, on the Builth road, an arrow directed us over a rough and rather greasy lane. Several short hills needed attention on account of their surfaces, and Danskin (3½ Rover) skidded but fortunately received no more damage than a cut knee and a dented mudguard. The first day's route was again met at Garth, but part of the way up the hill, which formed the consistent driving test, a sharp right-hand turn led along the base of the hills between Garth and Brecon. The mist was still lying in the valley, but was soon dispelled by the increasing power of the sun. Many single-figure gradients were encountered but there were no hills sufficient to test the powers of a modern machine, though the surface in places needed very careful negotiation.

The ascent of the Sugar Loaf in particular would be considered unrideable by the average tourist, as prolonged timber hauling had caused deep ruts

KINGSTON - ON - THAMES.

The A.C.U. Six Days Trial.—

Near the top of this stretch J. G. Lowles (8 Sunbeam) retired, owing to magneto trouble. After Llandovery the earlier riders found an arrow missing, but this was put right on the spot by the official A.C.U. sidecar outfit. This arrow directed competitors to the brake test hill, but unfortunately there was a misunderstanding, which caused about half the entry to go astray; and much time was wasted, and many missed the test altogether. The omission was rectified, however, during the afternoon.

A Machine on Fire.

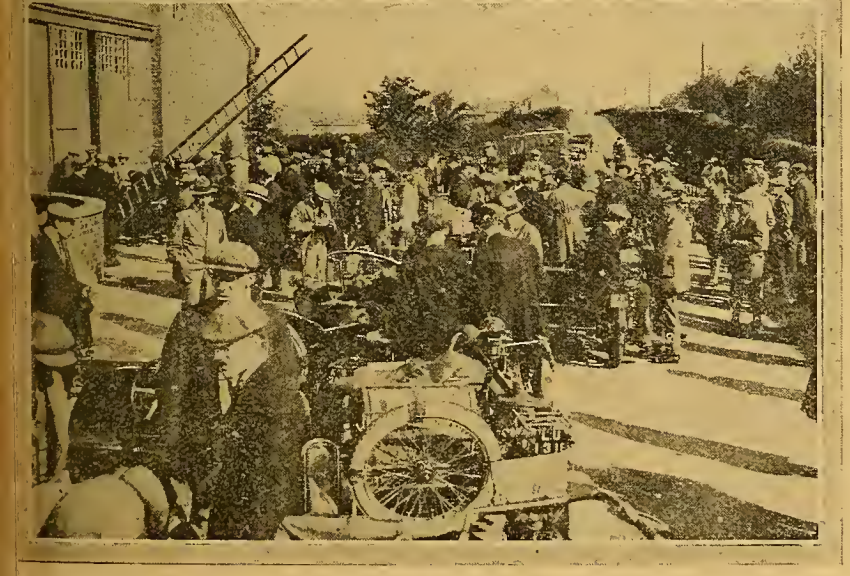
Near Llandovery, Hawkes (Morgan) was forced to retire with timing gear trouble. An arrow, some three miles from the lunch stop, had been torn down and replaced wrongly, but this was corrected before any serious harm could come of it. In fairness to the A.C.U., it should be repeated that the arrowing generally was perfect. The Emlyn Arms at Newcastle Emlyn was the appointed lunch stop, the machines being parked in a field behind the hotel. Here Watson's Ariel caught fire during the refilling process, but the flames were extinguished without damage. A sharp hill out of the town was lined with spectators, but beyond bumpy roads there was no very noticeable feature till the sea came into view during the long descent to Aberaron.

Over the Mountains.

After following the coast for a few miles, in the direction of Aberystwyth, a sharp corner to the right leads up a steepish hill with a left hand hairpin bend, but as the surface was good it caused no trouble. However, a long slope followed past the "Cross Inn," and in less than seven miles the 1,000ft. altitude had been attained from practically sea level. Then came a series of narrow lanes with one sharp loose-surfaced hill before the *pièce de résistance* of the day—a long hill near Aspytty Ystwyth was reached. This hill

The competing machines were housed in two large garages, the floors of which were divided into spaces bearing the numbers of the competitors.

is the worst encountered so far, but even so it is not very trying in dry weather, and only one short piece of steep gradient was included. Following the hill came a long stretch of moorland road, grass-grown most of the way, and including more watersplashes and cross gulleys than it is possible to mention. There were, however, only two splashes of any depth, and though these caused some momentary belt-slip, nothing more serious was recorded. At the head of Elan Valley real roads were again encountered, and a beautiful run by the side of the Birmingham Corporation reservoir led to Rhayader. The run in from this town was over perfect roads which came as a relief to everyone as the day's gruelling had more effect on the riders than on the machines.



The scene each morning outside the official garage (the Drill Hall, Llandrindod Wells) was very animated. The real interest of the general public was most marked.

NOTES.

Generally speaking, there was little trouble to report, such defects as occurred being confined to tyres and ignition. It is curious to note how this latter trouble cropped up in the first two days, though English magnetos are not to blame.

Tim Wood's number was 51. This was also his number in the T.T., and his brother has drawn the same figures in two trials. It seems to be a Scott lucky number.

Edwards (3½ Humber) was delayed with carburetter trouble, and was unlucky enough to get a puncture, which prevented his making up time.

At the finishing point, when Greaves's Morgan was being refilled, a quantity of water was inadvertently poured into the petrol tank. The whole tank had to be emptied as a precaution against future trouble.

The Blackburne team are going strong, the only trouble so far reported being the failure of Watson-Bourne's speed indicator.

L. A. Bees is pursued with bad luck, and his front spindle bearings did not look at all healthy at the finish of to-day's run.

The Scott team are running splendidly, and climb nearly all hills on top gear.

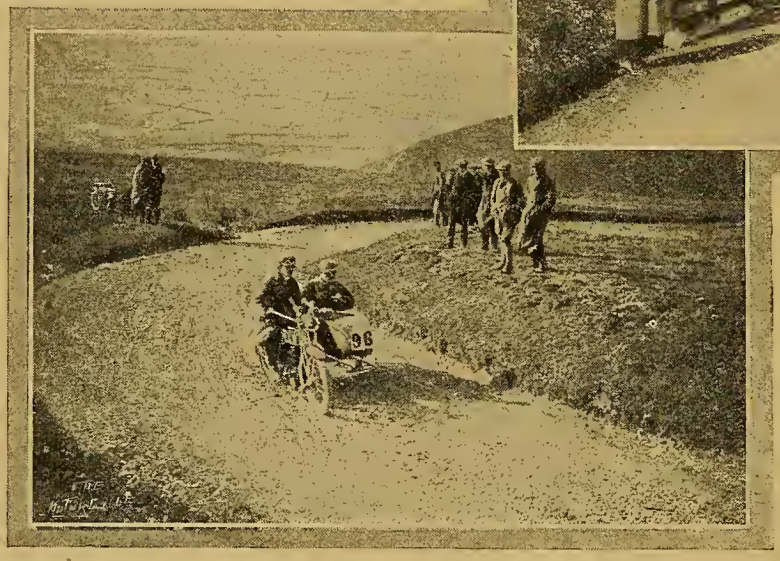
The numerous watersplashes did not cause the trouble which was anticipated.

What say Watson (6-7 Ariel sc.) and Greaves (Morgan) of their respective trials by fire and water?

The A.C.U. Six Days Trial.—

The Triumphs seem to have plenty of power in hand. The sidecar outfits are fitted with 28in. wheels and a new front brake. The cleanliness of the engines is also very noticeable.

Apart from Tuesday morning's misplaced arrow, something went wrong in the neighbourhood of Rhayader, where quite a number of car owners and motor cyclists alongside the reservoir patiently awaited the competitors who never arrived. It was never intended that the competitors should do more than skirt the head of the Elan Valley.



On Panne Hill during the first part of the consistent driving test on the first day of the trial. (Right) France's representative, the 5-6 G.L. sidecar, driven by F. Thorp (Left) C. R. Collier's 8 Matchless.

The remarkable result of 110 out of 111 completing the course on the first day was too good to be maintained, but it would have been even better had not Sumner, who retired so early, been the victim of an unfortunate accident, due to misunderstanding a policeman's signal.

The number of competitors who reported no-trouble runs on Tuesday was remarkable, despite the rough roads.

We saw G. Dance start on Tuesday, and he told us that his momentary stop on Panne Hill (what an appropriate name!) was due to running on to a patch of loose stones while he was intently examining his watch. He swerved and in so doing accidentally closed the throttle. Bad luck, indeed, for the Sunbeam team!

E. W. Merrall, who last rode in the 1911 trial on a P. and M., was travelling magnificently on his 1915 model Morgan-Jap.

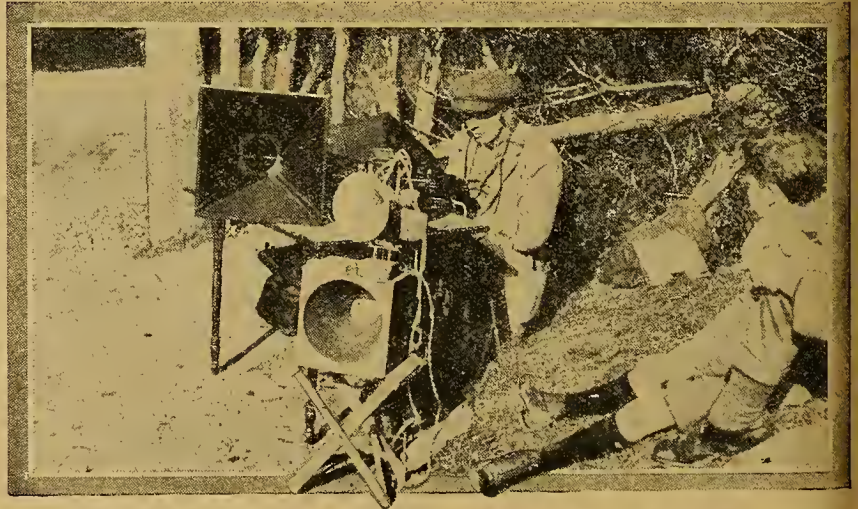
W. D. Hawkes retired on Tuesday morning with timing gear trouble near Llandovery. The same morning saw the retirement of R. H. Baxter (2¼ Radco) with tank trouble—not the first instance of faulty tanks—and J. G. Lowles, an amateur driver of an 8 Sunbeam-M.A.G. sidecar, who had timing gear trouble on Monday, and magneto trouble on Tuesday. In fact, on examination, it was found that a carbon brush was missing, and he is said to have told an observer that he recollected finding it after he overhauled his magneto a week ago!

WEDNESDAY'S RUN OF 152¼ MILES.

Llandrindod, Rhayader, St. Harmon Tylwch, Llanidloes, Stay-a-Little, Llanbrynmair, Cemmaes Road Station, Dinas Mawddwy, Bwlch-y-Groes, Bala (lunch control). Bala, Llanwddyn, Cann Office, Llanfair Caereinion, Newtown, Dolfor, Beguildy, Knighton, Bleddfa, Llandrindod.

In comparison with the two previous days' runs, Wednesday's trip, with the exception of Bwlch-y-Groes and the notorious Hirnant Pass, was voted comparatively easy. That was the consensus of opinion of the competitors; but we must say that the rough going in parts, the myriads of hairpin bends, coupled with the two steep ascents aforementioned, have made a lasting impression on our memory—and a temporary impression upon our anatomy. Why *do* makers hesitate so long with spring frames?

It was again fine, but a thick mist for the first forty miles or so prevented goggles from being worn. There was a considerably depleted list of starters this



A feature of this year's trial was the crediting of ten marks of the 200 total for "silence." On the first day each machine passed *en route* an audiometer invented and operated by Maj. A. M. Low.

HUTCHINSON

Don't be too Conservative.

MOST of us are too Conservative. Provided that we get reasonable service, we go religiously to one tailor; we buy the same make of tyre—and so on. We are content because we don't know of anything better, and are too cautious to take the risk of finding it.

Now, that is no good—because we miss so much. Certainly, the motor cyclist who has not tried Hutchinsons has missed *maximum tyre service.*

The history of the Hutchinson Tyre in all the leading trials is proof of that.

The latest success is:

SUTTON BANK HILL-CLIMB.

The A.C.U. Six Days Trials.—

day, but the survivors travelled most regularly, a puncture here and there, or a throttle slide stuck being the trivial adjustments observed by the roadside. A northerly direction was followed on Wednesday to Llanidloes, some of the roads being so narrow that a sidecar almost brushed the hedges by the roadside. The climb at Tylwch, with the usual hairpin bend on a single figure gradient, was the only ascent of note. The arrows led the riders through magnificent scenery, past the lead mines, up Fan Hill to Stay-a-Little, which climb

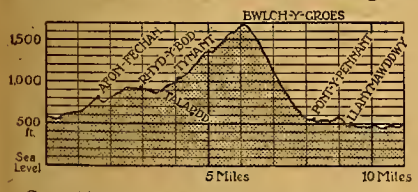
SCENE ON THE MOST SEVERE HILL OF THE TRIAL.

(Left) A general view of Bwlch-y-Groes, showing the imposing nature of the scenery. One of the Ariel riders making a good ascent. (Right) Hugh Gibson (8 Clyno sc.) passing a less fortunate competitor on the narrow part of the hill, where the road skirts the precipice. It was on this hill where, in an open trial some years ago, a press photographer went over the edge, his sidecar outfit falling some 200ft. into the valley. Fortunately nothing of a like nature happened in last week's event.

appeared easy, and, indeed, the protruding rocks and the tortuous course, a watersplash or two, as well as the little acclivities, sunk into oblivion compared to the tit-bit of the morning's run, viz., the ascent of Bwlch-y-Groes (The Pass of the Cross), which, commencing with an acute bend to the right on a single figure gradient, rises 1,790 feet in two miles.

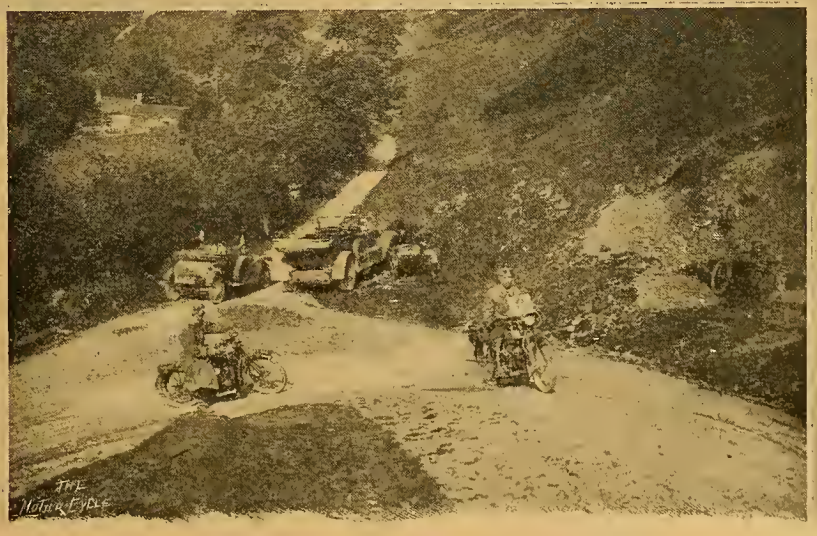
We arrived just ahead of the competitors, and were thus able to observe the whole of the performances from the top bend, which gives a wonderful panorama of scenery and a splendid view of the steepest stretch.

The official A.C.U. sidecar led the way and, as a foretaste of what the many spectators were likely to see, the engine jibbed after passing through the gate,



Some idea of the gradient of Bwlch-y-Groes one of the test hills of the trial, will be conveyed by the contour shown above.

and the driver dismounted and ran alongside—it should be observed that a very hot pace had been maintained from Llandrindod. F. J. Watson (6 Ariel sc.) led the way, followed by J. Emerson (3 A.B.C.), and both did well. Then several competitors were observed in the distance to come to a standstill, among them W. Drake (3½ P. and M.) and G. D. Hardee (8 Matchless), so that the P. and M. and Matchless teams lost marks. T. B. G. Vale (3½ Ariel) climbed very steadily, and Creak Davis (Chater-Lea sc.) received quite an ovation for the masterly way in which he avoided G. E. Stobart (5·6 James sc.) and E. F. Chidley (3½ P. and M.), who came to a standstill on the steepest stretch. D. Alexander (8 Enfield) stopped, restarted almost immediately, and finished well. Splendid ascents were made by T. Rutherford (3½ Sunbeam), who is riding most consistently, and the Scott team. The performances of the last-named riders have evoked much praise, their sure and silent climbing being a



The severe hairpin which precedes the long climb of Bwlch-y-Groes. F. C. Ball (2¾ Douglas is followed by a non-competitor on an Allon two-stroke.

The A.C.U. Six Days Trial.—

feature of the trial. J. H. Place (8 Dot sc.) stopped due to overheating, since after a brief rest he restarted and finished well. Victor Horsman (4 Norton) was notable for an impressive ascent, as also R. Lewis (3½ P. and M.) and F. Turvey (4¼ B.S.A.). E. F. Goodman (2¼ Velocette) found the hill too steep, but these baby machines are, nevertheless, gaining much credit for their reliable running. H. F. Edwards (4¼ B.S.A.) just got up, but F. W. Applebee, to the wonder of his *confrères*, climbed up quite easily and got a well-deserved ovation. P. W. Moffat (3½ Douglas) behaved as a veteran competition rider usually does, and seemed to have plenty in hand; de la Hay (3½ Sunbeam) and Harry Reid (8 Dot sc.) performing equally well. S. Parker on an 8 h.p. Enfield passed P. Pike (2¼ Levis) on the steepest gradient, and both performed excellently; but Merrall found the 1 in 4 stretch just too steep for his 1915 8 h.p. Morgan. Enticknapp (4 Blackburne) and H. Greaves (10 Morgan) in close company made excellent climbs, whilst Guise (8 Enfield sc.) stopped but restarted well.

Other good ascents noted were by F. W. Giles (6 A.J.S. sc.), Isaac (Rover), Wade (6 A.J.S.), and S. Hall (10 Morgan). Brown (5 Zenith) dismounted when apparently going well, and then hopped on to the footrest again. Hoult (8 Matchless sc.) made a good climb. In close company, Watson Bourne (4 Blackburne), Oliver (3½ Sunbeam), and Capt. Lindsay (4 Norton) made clean and sure ascents. Colliver (7 Indian sc.) made a fine climb. Peck (3½ Ariel) and Shemans (4 Triumph sc.) were side by side for a time, the Ariel rider forging ahead, Shemans dismounting when on the steepest stretch.

Dance (3½ Sunbeam) was quite fast, also Shillito on a similar machine. Cross (4 Triumph) did well, whilst Jones (3½ Ariel sc.) stopped and gave the spectators a thrilling five seconds when his machine commenced to run back, for a sheer drop awaited him on one side. He managed, however, to back his machine into the bank on the opposite side, colliding with a non-competitor's machine in the process.

A Useful Spectator.—

A thoughtful spectator with a huge telescope proved most useful in announcing the number of the competitors who stopped on the lower reaches. Townshend (4 Sunbeam), Collier (8 Matchless sc.), Strange (3½ James), Holroyd (8 Blackburne), James (8 Morgan), Ryecroft and Pattinson (4 Triumphs), Stordy, (2¾ A.J.S.), Noble (5 Rover), are others we noted for first-rate climbs.

When H. Fairley came up on the A.B.C. in good style, a spectator announced to all and sundry, "These are the machines which have never been made." Bottomley's Harley-Davidson sc. went up easily, whilst Lane (4¼ B.S.A.) had a sporting passenger, who, after pushing and running, finally took a flying nose dive into his seat again. Wills (6 Ariel sc.), Haggas (8 New Imperial sc.) (with Norman Longfield, the Scott rider, as passenger), Charlesworth (5 Zenith), Prytherch (7-9 Indian), and Wood (4¼ B.S.A.) did well, then, after a further crop of failures, Hugh Gibson demonstrated the hill-climbing abilities of the 1920 model 8 h.p. spring frame Clyno sidecar to advantage. Lt. Alan Hill (3½ Scott) was noticeable for a clean ascent, also Dudley and Newman (3½ Sunbeams), Choldcroft (4 A.J.S.), Heath and Collins (6 A.J.S.), Cooke (4 Triumph), and Mundy (8 Matchless). Edmond, with his 4 h.p. Triumph sc., had power in reserve.

At five minutes to one all the riders—now totalling less than 100—had passed Bwlch-y-Groes, twenty-seven riders failing on the hill. Thence followed a run to Bala for lunch, the homeward trip commencing with the difficult climb over the Hirnant Pass, notable for the scores of gulleys running diagonally across the road, to Lake Vyrnwy. Several riders failed on the ascent, which was too narrow to permit sidecars to pass one another without extreme danger. The descent was equally rough until the wild scenery gave place to a gorgeous view of the lake shimmering through the tall trees in its peaceful grandeur. Hereabouts we commenced to notice spanners, tyre levers, and spare parts, and, finally, the tool roll, strewn over the road, and stopped six times in the same number of miles to gather them. Our pockets bulging we sped on, and after many miles overtook Eric Williams (6 A.J.S.), whose toolbag we noticed unfastened. The owner of the tools was very grateful, but, unluckily, he stopped finally with gear box trouble, during the afternoon.

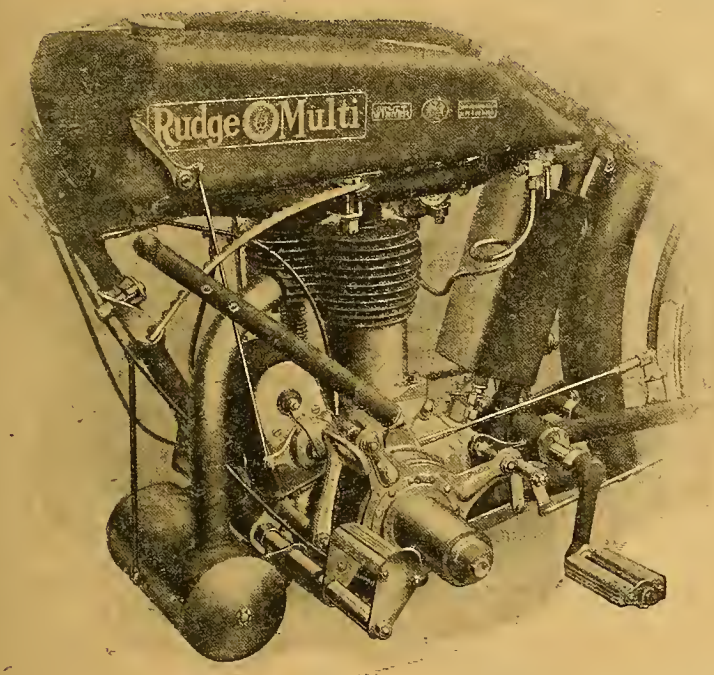
Easier Going.

On the hairpin between Lake Vyrnwy and Cann Office we saw Isaac (Rover) suffer a dry skid without damage to himself or machine, Applebee (4¼ B.S.A.) with his usual consistency neatly avoiding him. Through Llanfair Caereinion to Newtown there was nothing to trouble the competitors; indeed, from the crowds in the towns and villages, not to mention

Scenes on Bwlch-y-Groes (Wednesday's run). (Left) Charlesworth's Zenith emits clouds of smoke. (Right) J. Dosher (8 Enfield sidecar) steadily negotiating the loose surface.

RELIABILITY.

The gear that grips the gradient.



NOTCH BY NOTCH push the Multi lever forward up to the twentieth notch as the Rudge Multi gains speed along the level stretches and downhill, and

NOTCH BY NOTCH the Multi Lever is brought backwards as a stiff climb is negotiated, just as it is called for by the beat of the engine.

Lower the Multi gear soon enough.
Keep her "revving."

What the AUTO-CYCLE UNION'S

THE Auto-Cycle Union's Six Days Trial is an event of vital importance to every motor cyclist and prospective rider. It is not a race, but is a recognised Reliability Test by means of which the general efficiency of motor cycles and cycle cars at present on sale to the public is determined.

ANY machine which comes through the Six Days successfully is, without doubt, a sound and reliable production; those which gain premier awards are certainly good investments to the potential purchaser. The trade and public alike have confidence in the classic A.C.U. Trial, knowing that is the great opportunity for design and construction to prove their worth. Weakness of any form in machines or accessories is bound to be revealed in this Trial.

THE Auto-Cycle Union, as the controlling body for motor cycling competitions, organises the Six Days Trial; making all the regulations, selecting the route, and determining the awards. The Trial has been held annually (with the exception of the War period) since 1903, and has done more than can be calculated to improve the Motor Cycle, and to make motor cycling safe, enjoyable, and economical for everyone.

YEAR by year new tests and more stringent regulations have been imposed, and the gradual elimination of weaknesses and limitations in every class of machine is practical proof of the value of the Trial.

TO-DAY, with the great revival and extension of motor cycling that Peace has brought, there is more need for the A.C.U. Six Days Trial than ever. The motor cycle is still capable of much improvement. The new tests imposed in this year's Trial indicate the directions in which the Union is assisting the trade to improve the machines that will be offered to the public next Season.

IF you would like to know more of the institution which safeguards and advances all your motor cycling interests write to:—

THE SECRETARY, . . .

AUTO-CYCLE UNION,
83, Pall Mall, LONDON, S.W. 1.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Over the mountains near Yspytty Ystwyth. G. A. Strange (3½ James) leading H. O. Wood (3¾ Scott) and H. Pattinson (4 Triumph). The illustration conveys a good idea of the scenery in this comparatively little known part of Wales

the school children who turned out in force, the riders received many a cheer.

According to a facetious remark in the A.C.U. programme the main road to Llandrindod Wells is so badly cut up (ye gods! what roads we have had already!) that a detour was made over the Kerry Hills to Knighton and Penybont. Near the end Stordy (2¾ A.J.S.) suffered a dry skid, and damaged himself so that he retired. Davies (2¼ Velocette) walked in with a flat back tyre, his engine propelling his machine. Place (8 Dot-Jap) elected to retire owing to a broken sidecar frame, but, in the main, competitors reported non-stop runs and an enjoyable day despite the hills and the dust.

NOTES.

The arrowing was excellent, but was only just accomplished in time. Mr. Loughborough received a telephone message at the last moment to say that there were no arrows from Knighton home. He rushed out on the Morgan and did the job just in time in spite of rolling off a front cover and shedding most of the tools.

Enticknapp (4 Blackburne) broke his throttle wire, but is going well with the air slide fixed open and the throttle slide connected to the air lever. Watson Bourne, on the other 4 Blackburne, suffered from carburetter trouble on Bwlch-y-Groes, but made a clean ascent.

Amongst new arrivals we noticed Mr. J. L. Norton, on a 4 Norton sc., who had come in *via* Bwlch-y-Groes without trouble.

Gordon L. Fletcher, an old trials rider, this year acting in an official capacity, is driving the report car round the course.

Shemans attributed his failure on Bwlch-y-Groes to an exhaust valve cap, which came unscrewed, and blew out just over the crest of the hill.

Capt. Lindsay (3½ Norton) had a curious accident. A piece of rag which he keeps tucked in a corner between the handle-bar fittings was jolted out and became mixed up with the countershaft sprockets. However, he managed to get home close on time.

Tim Wood, F. G. Ball, and Lt. Alan Hill punctured, and Ryecroft (Triumph) also had tyre trouble, and had to change a tube.

W. Leslie Guy (3¾ Scott) approaching the gradient after rounding the hairpin at the foot of Bwlch-y-Groes.

Danskin (3½ Rover) has been unlucky enough to crack his timing gear cover, but is carrying on well.

Perhaps gear box trouble is not surprising on the sidecar mounts, for the changes of speed must average over 100 per day. Clutches have improved wonderfully. One seldom hears of trouble in this connection.

THURSDAY'S RUN OF 159¾ MILES.

Llandrindod, Newbridge-on-Wye, Builth, Garth, Llangammarch, Llanwrtyd, Llandovery, Pumpsaint, Lampeter, Tregaron, Ypsytty-Ystwyth, Devil's Bridge (lunch control), Devil's Bridge, Aberystwyth, Bow Street, Machynlleth, Stay-a-Little, Llanidloes, Tylwch, St. Harmon, Rhayader, Llandrindod.

To-day's run has been characterised by a curious mixture of good and bad roads. There was no particular feature in the morning's trip, except a second ascent of Yspytty Ystwyth hill. A mile from the start Watson had trouble with his intake system, but was soon under way again. Good roads were the order of the day for the first forty miles, and a sharp hill between Builth and Garth caused no trouble, on account of its excellent surface. Near Garth, Creak Davis had trouble with his gear box, and was forced to retire—an unfortunate occurrence, as he had been running very consistently up to this point.

Hereabouts Ashby (2½ Connaught) was encountered with magneto trouble. Though his magneto would spark, he could get no power out of his engine for some mysterious reason, and he was therefore compelled to retire.

Some of the moorland hills in this section were long and exposed, and beautiful views would have been obtained had the atmosphere been clearer. From Pumpsaint to Lampeter the roads were

On a spur of Plynlimmon, which was climbed on Thursday afternoon. (Left) F. J. Watson (6-7 Ariel sc.). (Right) F. W. Applebee (4¼ B.S.A.)

rough and trying to the rider, but no further hills were encountered till Tuesday's route was joined near Yspytty Ystwyth. Capt. C. P. Wood (3¾ Scott) made the ascent of the hill on top gear in spite of a flat back tyre, and though he had but five minutes to spare to the lunch stop at Devil's Bridge he put in a new butt-ended tube in two and a half minutes and reached the Hafod Arms Hotel five minutes later. Emerson had a bad puncture just before lunch, but made up time—no easy matter—between Devil's Bridge and Aberystwyth, and changed both tube and cover.

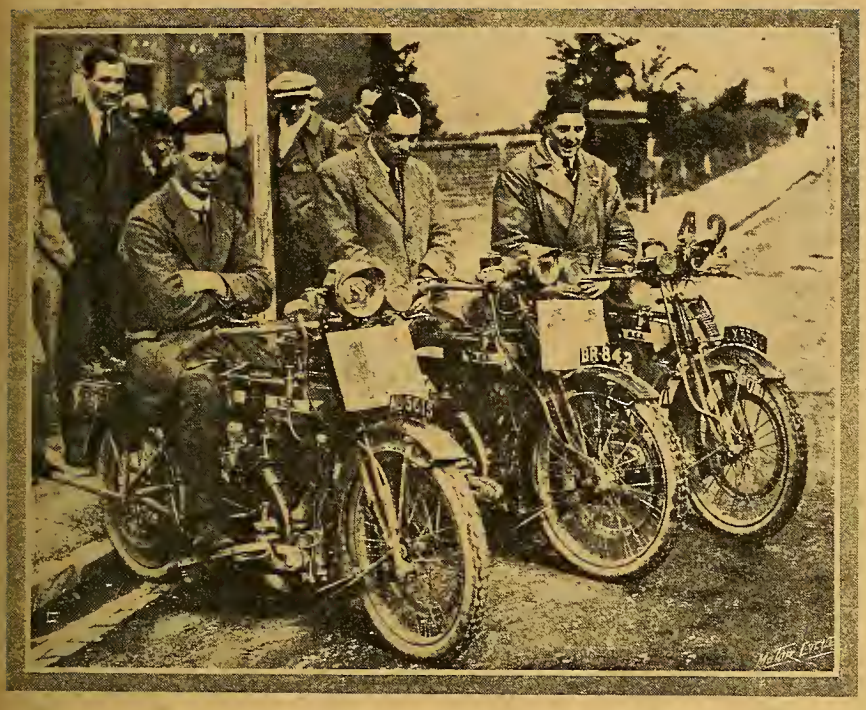
The road to Machynlleth is comparatively flat, but at this point the surface became rough, and a steady rise to the foot of Stay-a-Little hill is encountered. This hill is a spur of Plynlimmon, and has a rough and rocky surface for the first part and a very loose shale surface with a steep gradient at the finish. The distance from Machynlleth to the top of the hill is seven miles, and the difference in levels is approximately 1,700 feet. The surface, combined with heavy rain, caused some trouble, and several riders compared the climb to Bwlch-y-Groes for severity, in spite of the fact that there is nothing like the same length of severe gradient.

The early riders had the better conditions, for a slight drizzle turned to rain in earnest and the wind howled ominously. Such uncomfortable conditions had been unknown hitherto during the trial. Brown (3½ Sunbeam sc.) came to a standstill, Chambers (3½ B.S.A. sc.) dismounted and assisted his machine, though his engine continued to tug away manfully. When bunching occurred it was bad for all concerned, for the condition of the pass was such that it was often impossible for one machine to pass another. The Scotts and Zeniths in particular were noticeable for fast solo climbs, and generally the reliable running and wonderful top gear climbing of the Scotts has been something to marvel at. Applebee once again made a star ascent on his B.S.A., Shemans (4 Triumph sc.) and Sawer (4 Norton sc.) also making excellent showings. The Blackburne and P. and M. riders impressed us by their steady and sure ascents. Lane (4¼ B.S.A.) found the combination of steep gradient, loose stones, and gulleys too much for his mount, as did Kitcher (2¾ New Imperial). Among the very best passenger ascents were Colliver (Indian sc.)—who has ridden most consistently throughout—two Morgans, Edmond (4 Triumph), Giles (6 A.J.S.), and Stevens (4¼ James).

At the lunch stop (Devil's Bridge) on Thursday. H. Reed, who made a notable performance in completing the day's run with a damaged sidecar chassis.

A Piece of Hard Luck.

Charlie Collier, with H. A. in the sidecar, had bad luck, for in riding side by side with another sidecarist he was forced on to reefs of rock now thoroughly wet and slippery. Though neither driver nor passenger moved from their seats and the back wheel always continued to spin, the front wheel stopped momentarily, but a penalty ought not to be suffered on that account, since they moved away immediately by merely bumping the driving wheel. On the hill we chatted with James R. Haswell, the old Triumph rider in Six Days and Brooklands events, who was enjoying the fun as a spectator. The



The winning B.S.A. team: L. L. Sealey, F. Turvey, and H. F. Edwards. Their performance was remarkably consistent and the marks gained totalled 557.

terribly rough going brought many "remarks" from competitors as they passed us. Even after the gruelling ascent, the conditions did not improve, for the "road" wound round a ridge on the mountain side for miles past disused lead lines, over innumerable *caniveaux* of varying depth—some almost dangerous. No wonder sidecar frames gave trouble, few cars could survive such terrible going.

The descent of several of the previous day's test hills gave little relief on account of the protruding rocks and incessant twists.

Thenceforward the route consisted of a series of undulations more or less severe, and in the narrow lanes near Tylwch quite a bunch of competitors were held up by a flock of sheep, which had no room to pass. Beyond Llanidloes the road from Rhayader to Llandrindod is excellent, and gave plenty of scope for making up lost time to those who had been delayed. One of the unfortunates, however, was Danskin (3½ Rover), who broke a valve three miles from home, and was late in consequence.

Harry Reed broke his sidecar chassis, but put up a wonderful performance by bringing the damaged outfit home throughout the afternoon's run by means of roped sidecar supports. Every sportsman admired his grit. Nearing home we passed Fairley (3 A.B.C.), who owing to a broken oil pipe had a seized engine, and he was finally towed home behind a press car.

W. L. Guy (3¾ Scott) had two punctures, the last one just before lunch, which caused him to lose time. Stobart (5-6 James sc.) was going splendidly. The ranks of the riders were again somewhat seriously depleted. An unlucky incident occurred at the finish when a competitor who finished rather fast struck the rear of Sheman's Triumph sidecar outfit, and fractured the lug supporting the rear down tube. It was repaired by a blacksmith under official observation during the night, to enable the sidecar to finish. Rough luck indeed.

As showing the severity of Thursday's run, ten competitors retired, viz., S. T. Ashby (2½ Connaught), R. Creak Davis (8 Chater-Lea), E. Bottomley (7-9 Harley-Davidson), Capt. Oliver (3½ Sunbeam), H. L. Kitcher (2¾ New Imperial), H. Fairley (3 A.B.C.), E. F. Chidley (3½ P. and M.), H. Thorpe (4 Douglas), H. Reed (8 Dot), and W. R. Haggas (8 New Imperial).

NOTES.

Mr. Easting, maker of the Easting windscreen, who is among the many trade representatives at Llandrindod, experienced an accident on Thursday afternoon.

No rain was experienced until Thursday afternoon, so generally the conditions might have been even worse—but they have been bad enough in all conscience.

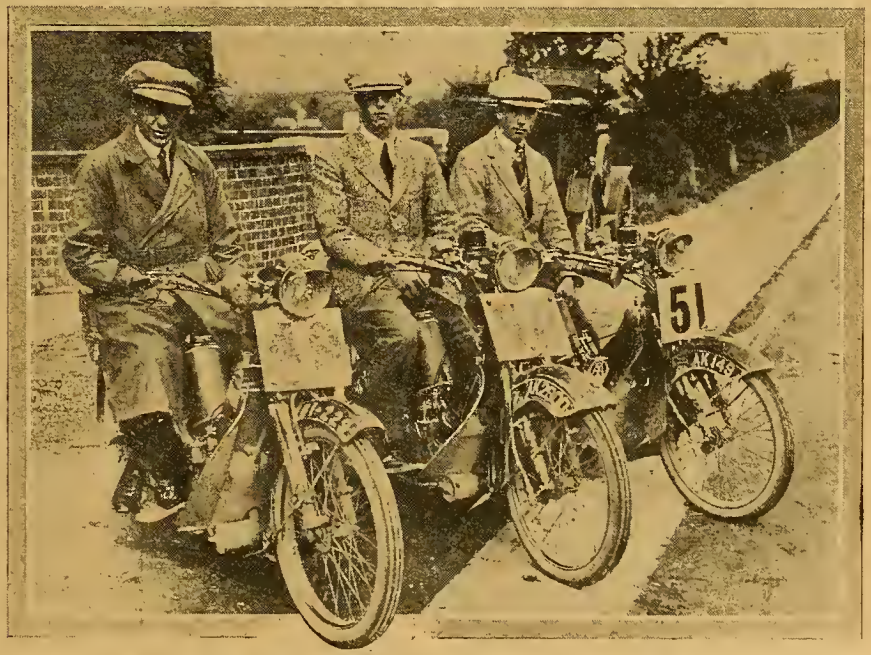
FRIDAY'S RUN OF 161¾ MILES.

Llandrindod, Builth, Garth, Beulah, Llanwrtyd, Llandovery, Llangadock, Pontardawe, Neath, Swansea (lunch control), Swansea, Pontardulais, Llanddarog, Llanfynydd, Abergorlech, Llansawel, Caio, Cilycwm, Llanfair-ar-y-bryn, Llangammarch, Garth (consistent driving test), Builth, Llandrindod.

The last day's run of the trial started on a showery morning, and from rumours current concerning the nature of the course, many competitors started with the idea that they had a difficult day before them.

In this they were correct, and the opinion was frequently expressed by solo riders that Friday afternoon's run was the most trying part of the whole trial.

The morning's run of 69¾ miles was easy, and beyond the fact that a secret check some two and threequarter miles from the town caught some competitors before they were even due to start—we personally blame the officials for that—the chief incident was the ascent of the Black Mountain from Llangadock—a lengthy climb over seven miles over a beautifully



The Scott team: W. Leslie Guy, Capt. C. P. Wood, M.C., and H. O. Wood. They were second in the running for the team prize, securing 539 marks

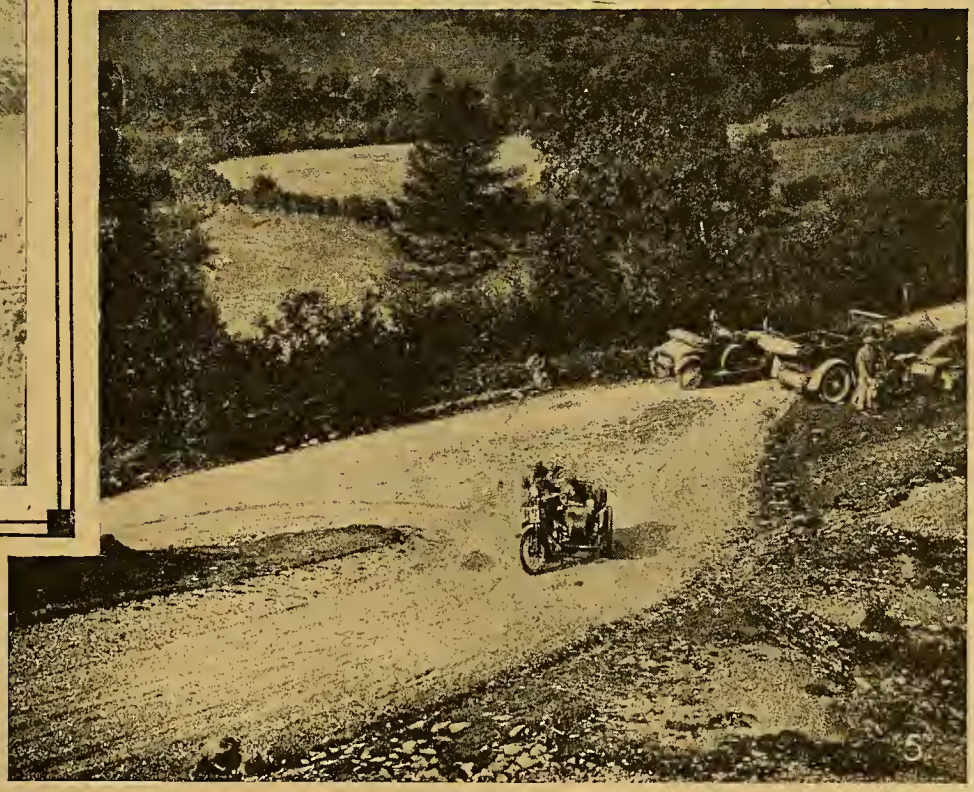
Croes.



The A.C.U. Six Days Trials.—

graded road with excellent surface. Quite a crowd of spectators had gathered at the hairpin near the summit, but beyond a display of careful cornering there was little to be seen, the only failure being due to a solo rider, who misjudged the corner.

The descent of the mountain was as rough and muddy as the ascent was good.

On leaving Pontardawe quite a sharp hill out of the town was included in the route, and then came an easy run through Neath to Swansea.

A few more arrows in the town would have been welcome, and though only one or two competitors went wrong, the early arrivals were not too sure of their way to the lunch stop. Edmond (4 Triumph sc.) made a fine, but unnecessary, ascent of Constitution Hill before lunch. The Royal Hotel, where lunch was provided, was some distance from Brown's garage, where the machines were stored.

Almost immediately after the luncheon interval, Constitution Hill was encountered. This was a fine, straightforward test, the hill being straight with a good cobble surface, and a maximum gradient which we should estimate at 1 in 4.

A shower as the first competitors arrived did not spoil the surface, and most of the ascents were uniformly good, though the crowd stood all over the hill, and non-competitors chose this very inopportune moment for showing off, and one non-competing machine in particular was so noisy that it was not likely to add to the popularity of the motor cycle or the owner.

The Test Afternoon.

On leaving Swansea for the ninety-two mile homeward run, a stiff head wind gave extra work to the engines. Undulating roads continued to Pontardulais, where the first long ascent of the afternoon was tackled. Following the descent of the far side of this hill there came a mile and a half of really good climbing, but the gradient was not sufficient to worry the surviving competitors. A series of narrow and rough lanes was next negotiated and, though the rain had cleared off, the surface was in a treacherous condition. H. F. Edwards (4¼ B.S.A.) skidded completely round in one spot, and we found him examining himself and his machine. Fortunately, no harm was done. Close to Caio quite a deep watersplash had to be crossed, and soon after came a steep rocky hill the surface of which had been repaired with loose earth and turf. Then followed a villainous descent where timber waggons had formed such deep ruts that solo riders had all their time taken up to remain in the saddle, and a few failed in this endeavour. Amongst these was Horsman (3½ Norton), who took a nasty fall, but managed to continue, though his tank was damaged and petrol was leaking.

Near Cilycwm, Merrall (8 Morgan) ran over a dog and damaged his rear wheel, and this was the cause of continued trouble with chains which spoilt an otherwise magnificent performance on a 1915 model. There was just one arrow missing near this spot, which caused some delay and a considerable discussion, but matters ended satisfactorily. A deep watersplash heralded a stretch of greasy lanes in which it was impossible to keep a solo machine straight for any length of time, and the conditions over the 12 m.p.h. limit section were so bad that it was hard to maintain even that average. Ball's machine struck the root of a tree, and the rear brake was damaged, this causing him to lose time and incidentally thirty marks. This trivial incident was sufficient to spoil the chances of the Douglas team. A spring of Gibson's sidecar broke in this section—the only trouble encountered by the Clyno throughout the long trial.

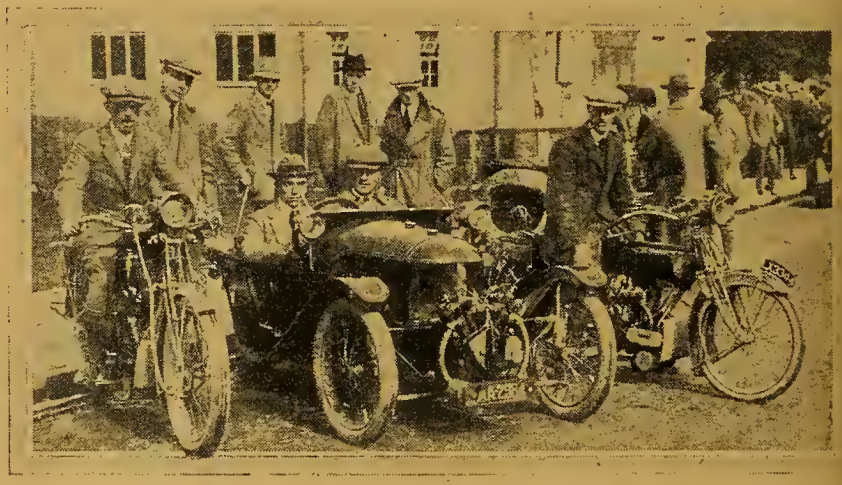
Driving Test Again!

The route was next varied by a long grass and boulder hill, the surface being so comparatively good that those who were behind time proceeded to make up a little. Towards the top, however, the bare rock became so pronounced that it was necessary to ease down somewhat; the descent of the opposite side also required careful driving. This and the following mile or two, of course, had been covered on Tuesday in the reverse direction. Near Llangammarch we came upon Hardee changing a wheel, and tyre troubles were prevalent during the remainder of the run. On reaching Garth a right-hand turn led to Panne Hill for the second stage of the consistent driving test.

Comparing the performances on Panne Hill on Friday with those of Monday, it can definitely be stated that, so far from a falling off in power being noticeable, the machines showed improved performances. Certainly the strong but cold wind blowing was in favour of the riders. Many had the hill so well in hand that they toyed with the gradient, adjusting their speeds as their watches showed that they were too fast or too slow compared to Monday's results. The passenger machine drivers in this connection were at a distinct advantage, since their passengers counted off the seconds, and announced the position loudly for the benefit of the driver. All things considered, the "consistent" driving test was not a success, introducing as it did the personal equation instead of confining the test to the qualities of the machine. A speed climb pure and simple would, in our judgment, have provided more interesting and valuable results.

Others who made fast ascents were Don (5 Zenith), Horsman (4 Norton), Baker (3¾ Scott), the brothers Wood (3¾ Scott), De-la-Hay (3½ Sunbeam), Morgan (10 Morgan), Noble (5 Rover), Applebee (4¼ B.S.A.), Giles (6 A.J.S. sc.)—who, by the way, had a non-stop run throughout the event except for a sooted plug when descending a hill—McGlasham (8 Matchless sc.), and Choldcroft (4 A.J.S.), whose watch stopped, so that he had nothing to guide him, and allowed his machine to romp up.

The end of the great trial of 1919 was at hand, but troubles were not over, for a lady standing in front of an important arrow on a corner caused several competitors to leave the course, including Colliver (Indian) and Baker (Scott). The former managed to return and catch up, but Baker had just encountered a crop of tyre troubles after a wonderfully consistent performance throughout the week. The canvas inside his rear cover had split, and was nipping inner tubes



By a coincidence three press representatives were propelled by Blackburne engines.

A large crowd has assembled to welcome the survivors home, a much depleted list, too, which is understandable considering the severe conditions, particularly the last day's terrible roads. Opinion was divided as usual as to the relative severity of the test. Some thought Scottish hills the more severe; others were equally emphatic that the Welsh terrors were as bad as anything yet included in a trial, and all were agreed that the trial was a sporting one and well organised, with the exception of the "C.D.T."

Saturday was devoted to a thorough scrutiny of the competing machines by the judges, with a view to "condition" marks being awarded. This year added importance was attached to the state of the surviving machines, and little or nothing escapes the eagle eyes of the judges. As the machines were examined "Done" was chalked on the saddles and they were wheeled out into the keeping of the riders. Most straightway started for home by road to all parts of the country.

A.C.U. SIX DAYS TRIAL, 1919.

CENTRE: LLANDRINDOD WELLS.

PROVISIONAL RESULTS:—

111 Starters. 81 Finished. 22 Gold Medals. 36 Silver Medals. 15 Bronze Medals. 9 No Awards.

In the Consistent Driving Test—the sum of the differences under 10 sec., 28%; under 20 secs. and over 10, 14%; under 50 secs. and over 20, 34%; over 50 secs., 24%.

Basis of Awards: marks credited at the start—200, made up as follows: Reliability 50, Silence 10, Hill-climbing 30, Acceleration 20, Maintenance of Efficiency 20, Brakes 10, Mudguards 10, Condition at finish 50. To secure awards competitors in the respective classes had to obtain the following marks: 250 cc. solo: Gold 150, silver 135, bronze 110. 350 cc. and 500 cc. solo: Gold 180, silver 165, bronze 140. 750 cc. and 1000 cc. solo: Gold 185, silver 170, bronze 145. 500 cc. sidecars: Gold 150, silver 135, bronze 110. 750 cc., 1000 cc. and over 1000 cc. sidecars: Gold 180, silver 165, bronze 140.

THE TEAM COMPETITION.

Winning Team: B.S.A. (Team A), 557 marks. Riders: H. F. Edwards, L. L. Sealey, and F. Turvey.

Other team scores: Scott, 539; Rover, 535; Enfield, 526; Sunbeam, 521; Blackburne, 519; Matchless, 507; Morgan, 498; Douglas, 459; Triumph, 445; and James, 439.

Zenith, Ariel, P. and M., A.J.S., New Imperial, and B.S.A. (Team B) failed to finish with all riders.

SPECIAL PRIZES.

Principality Prize (for Best Performance by Welsh Competitor).—M. Isaac (3½ Rover), 184 marks.

Special Benzole Prizes (for Best Performance in each Class by Riders using Benzole).

Class D.—H. O. Wood (3¾ Scott), 187 marks.
Class E.—J. W. Wills (6 Ariel), 178 marks.
Class G.—F. E. Jones (3½ Ariel), 152 marks.
Class H.—S. Sawer (4 Norton), 169 marks.
Class K.—Rex Mundy (8 Matchless), 186 marks.

NOTES.

P. Pike's performance on an entirely unprepared Levis is worthy of special mention.

To T. Rutherford, of the Cumberland Club, special credit is due. He was one of the few private owners to come through without trouble, and his Sunbeam finished in excellent condition.

Competitors agreed that the splendid attention given by Messrs. Tom Norton, Ltd., at their Llandrindod Wells garages was one of the most pleasing features of the trials week.

F. W. Applebee, or "Pa" as he is affectionately called, made probably the most creditable showing of the whole trial. He piloted his 4¼ B.S.A. machine up the roughest hills with never a falter, was always on time, and its condition at the finish—an all-important point—was wonderful. "F. W." is actually fifty-nine years of age, and he is as keen as ever.

Oliver (3½ Sunbeam) mended seven punctures on Thursday, and finally burst a cover which caused him to retire.

The consistent driving test was not at all popular with the competitors, and the committee recognised that the penalty laid down in the regulations for exceeding ten seconds was too severe. This was amended, one mark being deducted for every ten seconds or part of ten seconds in excess of a total of ten seconds up to a maximum loss of twenty marks.

The 6 A.J.S. sidecar ridden by F. W. Giles finished in magnificent order, though it had covered 6,000 miles before the start of the trial. It had a Millford sidecar with three-point attachment. The only trouble was a sooted plug when descending a hill with the gear engaged.

The winners of the team prize (Messrs. H. F. Edwards, L. L. Sealey, and F. Turvey, jun.) rode 4¼ B.S.A. chain-drive machines with minimum gear ratio of 5.1 and maximum ratio 13.2. The bore and stroke were 85 mm. and 98 mm. respectively, equalling 557 c.c. capacity. The machines were fitted with E.I.C. magnetos and Dunlop tyres, and were lubricated throughout the trial by Wakefield's Castrol.

"Maximum" Road Performances.

To show how the judges' examination affected the awards, we give below a list of riders who had "clean sheets" for running to schedule, climbing all hills, and who lost no marks in the consistent driving test. In other words, Saturday's examination by the judges led to the deduction of marks:

Rider and Machine.	Marks and Award.	
P. W. Moffatt (3½ Douglas) ..	167	Silver medal
G. Featherstonhaugh (3½ Rover)	179	Silver medal
*J. A. Newman (3½ Sunbeam)	188	Gold medal
*T. Rutherford (3½ Sunbeam)	184	Gold medal
D. H. Noble (5 Rover)	189	Gold medal
H. O. Wood (3¾ Scott)	187	Gold medal
F. W. Giles (6 A.J.S. sc.) ..	185	Gold medal
F. G. Edmond (4 Triumph sc.)	180	Gold medal
H. Gibson (8 Clyno sc.)	165	Silver medal
E. A. Colliver (7-9 Indian sc.)	156	Bronze medal
H. F. S. Morgan (8 Morgan)..	185	Gold medal

*Private owners.

Police Activity.

We learn that the police are rigorously enforcing the observation of the ten-mile limit in Bushey on the London-Watford road.

Sheffield Registration Index.

The post-war growth of automobilism has necessitated the allocation of additional motor registration index letters to many provincial centres. Sheffield is the latest to require one, the new series of numbers being preceded by WA.

The Brussels Championship.

Belgium is quickly coming back to the realm of sport. The motor cycling championship of Brussels has just been decided over a ninety-eight kilometre course in the Bulwark State, in which many British and American machines competed. The result was a win for Eugene Taymens, on a 4 h.p. Triumph, and this despite the opposition from big twin machines.

Six Days Trial in France.

The French Six Days Trials will be held during the month of August, 1920. This event will take place in the neighbourhood of Grenoble, and will comprise runs over the Lautaret and the Galibier Passes, these being the highest mountain roads in France, and 10,000 feet above sea level. It will be remembered that the French Six Days Trials were originally planned for August, 1914. When war was declared a certain number of English riders were in the French Alps practising for this event, and they experienced the greatest difficulty in returning across France to the Channel ports and home. Next year's trials will follow the same lines as those interrupted by the war. Taking Grenoble as a starting point, there will be four distinct out and home trips, each one comprising very steep and difficult Alpine roads. The trials will be broken by one day's rest at Grenoble, when the machines will be on exhibition. It will be terminated by a two-day run from Grenoble to Paris. The French Six Days Trials will also include the International Tourist Trophy Trial for which national teams will be entered. The French event is open to all types of motor cycles and to cycle cars of 1,100 c.c. capacity. The rules, generally, are based on the English Six Days Trials. This event will be the most important motor cycle competition of the year, and probably the only one organised by the French Union Motocycliste.

The Bosch Patents.

A licence to work thirty-eight Bosch patents, of dates between 1908 and 1915, has been granted by the Custodian of Enemy Patents to the British Lighting and Ignition Co., Ltd. This licence does not affect the validity of the patents, nor does it mean that the above English company may work them without the obligation of paying royalties.

A Deliberate Theft.

While riding between Fenny and Stony Stratford on the night of the 27th ult., Cyril A. Hall, on a 1913 T.T. 6 h.p. Matchless, met with a serious accident, and lay unconscious until morning. On recovering, he went to a farm for assistance, and returned for his motor cycle shortly before 7 a.m. To his surprise it had disappeared, despite the fact that the front wheel was so badly damaged as to be unusable. The registered number was BH 4498, and Mr. Hall would be glad of any information which would throw light upon its present whereabouts. His address is 185, Church Street, Wolverton, Bucks.

Special Features.

OVERSEAS NOTES.
REPORT OF THE A.C.U. SIX DAYS TRIALS.
ITALIAN T.T.

Swimmer and Motor Cyclist.

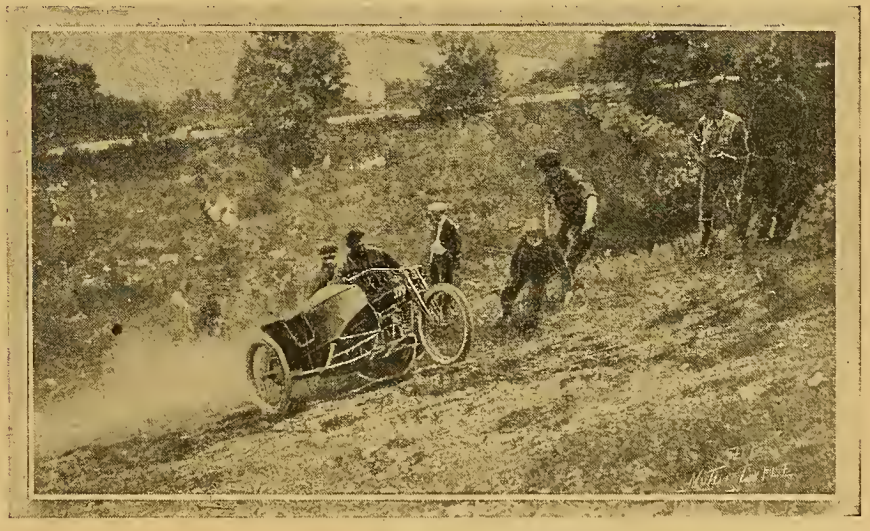
In the Ceinture de Paris Trial, which took place on the 13th inst., one of the competitors was Mademoiselle Y. de Graine, driving a Sunbeam and sidecar. Mademoiselle de Graine is the celebrated French lady swimmer.

Death of Mr. James Hazlewood, sen.

We regret to hear of the death of Mr. James Hazlewood, sen., the founder of Hazlewoods, Ltd., who passed away on the 12th inst. The late Mr. Hazlewood commenced the manufacture of bicycles many years ago in conjunction with Mr. Warman.

A French Amateur Event.

Quite an important list of entries, among them British and American machines, was received for the Grande Ceinture, an amateur event run by the Motor Cycle Club of France on Sunday, the 21st inst. A hill-climbing test was held on the Cœur-Volant in the afternoon, the finish being at Saint-Cloud. The official results are not yet available.



HILL-CLIMBING IN AMERICA.

Hill-climbing is becoming as popular a pastime in America as in this country, although in the majority of cases freak gradients are chosen, which often necessitate specially shod rear tyres. The photograph shows an outfit at Port Jervis, U.S.A.

Kilometre Races at Geneva.

A flying kilometre race and kilometre race with standing start were held at Geneva on the 14th inst. Robert (Moto-sacoche) won the flying kilometre with a speed of 61 m.p.h., beating the previous best made in 1917 by 3¼ m.p.h. The best time for the kilometre with standing start was accomplished by Tardin in 48s., equalling a speed of 46½ m.p.h.

The A.A. Benzole Test.

The two Triumph outfits completed the first 1,000 miles of their run near Paisley last Friday. They are, of course, using National Benzole entirely, and, so far, no troubles have arisen. The remaining 4,000 miles will be completed in returning to England, visiting various parts of Yorkshire, Lancashire, and the Midlands, and then journeying to Cornwall and Devon. Before finishing again in London a detour into the Eastern counties will be made.

A New Flying Club.

On Monday, September 15th, the London Flying Club was opened at Hendon. In view of the active interest taken by this journal in aviation during the war, it cannot be without interest to our readers to record the fact that a unique club on the lines of an American country club has been founded at Hendon, adjoining the Aerodrome, on the very ground where some 600 Service pilots were taught flying during the war. In his speech at the opening lunch, Lord Louth referred to it as a "wonder" club, and such it is. There are over eighty bedrooms, and members can not only fly, hire machines and pilot themselves, but may hire cars at a reasonable figure, and enjoy the delights of tennis, swimming, shooting, fishing, skating, and golf. After lunch free flights were given to many of the guests.

IMPORTANT DATES.

Paris Salon -	Oct. 9th to 19th.
Olympia Car Show	Nov. 7th to 15th.
Olympia Motor Cycle Show,	Nov. 24th to 29th.
Brussels Show -	Dec. 8th to 13th.

To Delay the Gear Change is Fatal.

On Wednesday, when the competitors in the A.C.U. Trials had to climb Bwlch-y-Groes, many drivers tried to travel too far on top or second gear, and also attempted to get back to top gear long before they were really up the hill.

The Silencer Regulations.

Two motor engineers were recently proceeded against in Lancashire for riding motor cycles which were without proper silencers. Both defendants urged that long exhaust pipes (exceeding 3ft. 6in. in length) complied with the regulations, and instanced various standard models supplied to the public so fitted. Some confusion as to the exact requirements of the law appeared to exist, and, in consequence, the defendants were ordered merely to pay the costs, and their licences were not endorsed.

French Trials Results.

The results of the Circuit des Quatre Departements, a French trial held in the vicinity of St. Etienne on the 14th inst., are: General classification. 1, Naas (Sunbeam); 2, Lavalette (Peugeot); 3, Theuriet (Sunbeam); 4, Bobby (Triumph); 5, Lapallud (Motosacoche); 6, Davis (Douglas).

A Douglas was first in the 350 c.c. class, a Motosacoche in the 500 c.c. class, and a Sunbeam in the 750 c.c. class. The Moto Club Parisien won the team prize

A Warning.

Motor cyclists are advised to exercise the greatest caution when passing through Knaresborough. A reader was recently fined 27s. and his licence endorsed for an obscured number plate.

From "Our Motoring Correspondent."

In a short description of the Six Days Trials a daily paper informs us that "a notable . . . failure was that of H. Fairly on a Horizontal, who opposed a B.C., a new type of machine which was a feature of much interest."

The Coventry Club Hill Climb.

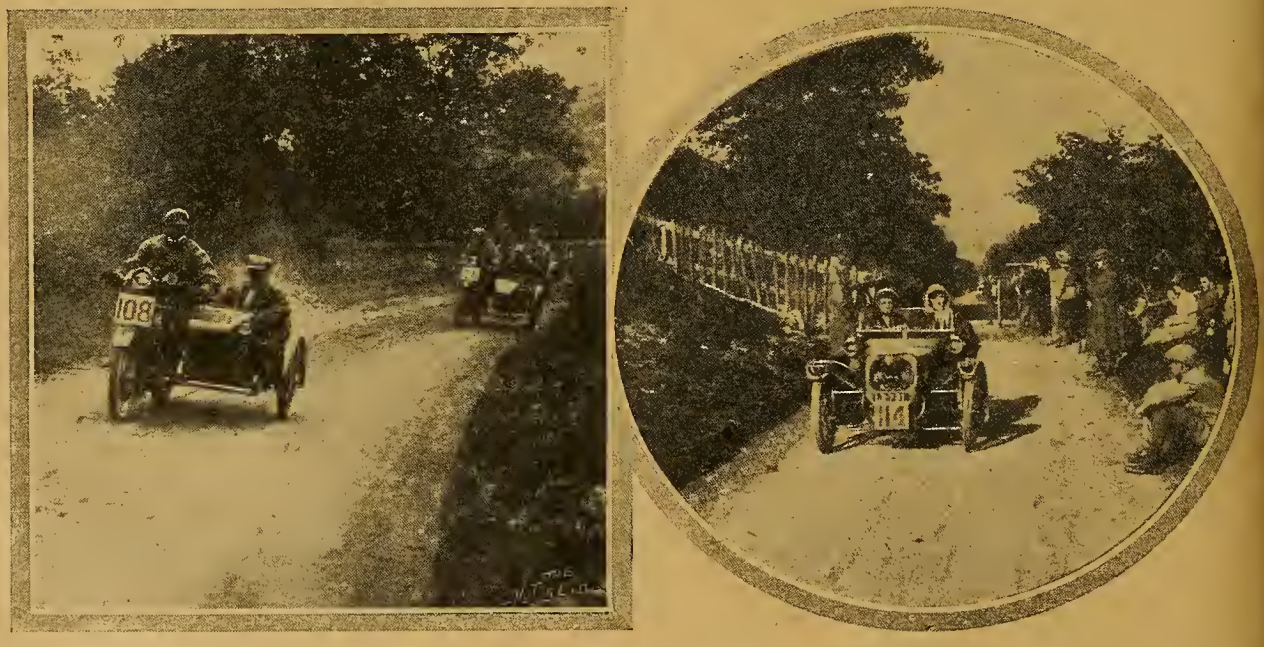
Owing to reasons over which the club has no control, it has been found impossible to hold the hill-climb which had been arranged for Saturday next. The event, therefore, has been abandoned this year.

A Mysterious Hill.

Many men who have climbed every competition hill in Scotland are afraid of Bwlch-y-Groes. One rider avers there is something unaccountable about the hill that tries the engines in a most peculiar manner. The road, he said, "cannot have a solid foundation, and the surface shakes like jelly when the machines pass over it, and it takes all the life out of an engine."

Energy.

A member of our staff witnessed the other day an incident which afforded proof of the unbounded energy of motor cyclists and the laziness of passengers. The rear tyre of a sidecar outfit punctured at the bottom of a fairly steep incline. It was expected the driver would unload his cargo, which consisted of the entire family, but he elected to push the lot up the gradient of about 350 yards to the nearest garage. None of the passengers offered to dismount.



THE A.C.U. SIX DAYS TRIAL.

(Left) Near Llandovery on the second day. The Colonial Model Enfield, driven by S. Parker, followed by T. Stevens (4¼ James sc.) and another sidecar competitor. (Right) The 8 h.p. Morgan, driven by W. D. Hawkes, passing Maj. Low's audiometer on Panne Hill, near Garth.

1920 MODELS

Indian

Motocycles.

We hope within the next few weeks to be in a position to give full particulars of our New Season's programme, together with illustrations and specifications of the

BIG 7 h.p. SPRING FRAME POWERPLUS MODEL WITH ELECTRIC EQUIPMENT,

and a

LITTLE 4 h.p. POWERPLUS MACHINE.

The 4 h.p. model has a large number of interesting features, and, we believe, will prove one of the most popular models we have yet introduced.

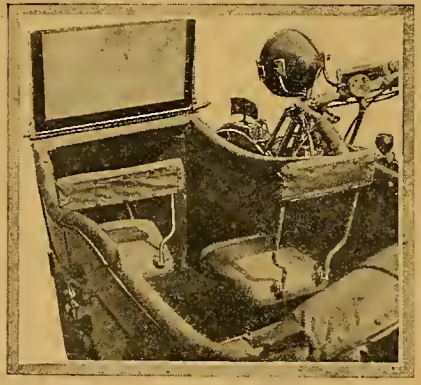
THE PATEY FAMILY SIDECAR



Interior of the family sidecar. The two small seats are easily removed, thus allowing plenty of luggage room inside the body when travelling with one passenger

Designed to carry in comfort one adult and two children or two adults. Can be fitted to any Motor Cycle.

Orders now being taken for Early Delivery.

Fit your A.M.A.C. Carburetter with a

W.S.R. PATENT VARIABLE JET ADAPTER.

⅞ths across thread.

WHAT IT DOES.

Gives You More Power—Higher Speed — Slow Running—More Mileage per Gallon — Greater Vaporization, Petrol emerging in Circular Spray.

Fitted in one minute to A.M.A.C. carburetters—simply unscrew plug holding jet and screw in the jet adapter.

This jet can be varied while running, giving a large jet for stiff hills down to a small one for ordinary running. No stopping to take out jet to clear obstruction—the W.S.R. can be cleared while machine is in motion.

State make of Engine, when ordering.

Half-size.

8/6 net.

Postage 3d.

What Users say about the W.S.R. VARIABLE JET ADAPTER.

"I received your Variable Jet Adapter. I think it is a wonderful little invention, and worth any amount. It should be of special use to riders living in large towns, where one often requires to travel at exceptionally low speed. I shall not hesitate to recommend it to all the motor cyclists I know."

"The Variable Jet Adapter you sent me is a great success. I fitted it to the carburetter and gave it a quarter turn, the engine runs much smoother and uses less petrol. This is a *very* hilly country, and on some hills (off the main roads) I had to jump off and run by the side. I can get up easily now. The machine is a 4 h.p. Douglas and sidecar. I shall certainly recommend it strongly."

We make a smaller size ⅞ths across thread for older type A.M.A.C. Carburetter, and also a short type for engines with little clearance between carburetter and chain case, such as the Villiers engine

Stocked by the Metropolitan Machinists Co., Ltd., 248, Bishopsgate, E.C.2

Horsham M.C. and C.C.

A new club has recently been formed in Horsham, Sussex, which already has a membership of over thirty. Local motor cyclists desiring to join the club should communicate with Mr. H. L. Gouldsmith, at the club's headquarters, King's Head Hotel, Horsham.

Glasgow Open Hill Climb.

Last week, on page 312, we were able to show photographs of two of the winners in the second open hill-climb promoted by the Western M.C. (Glasgow). The hill was Garshake in Dumbartonshire, and the event took place on the 13th inst. There were five classes, prizes being given to the winner in each, and five novices' prizes were also offered. A record entry of sixty-six was secured, and everything was carried out in good style. The hill is 650 yards long, and the gradient varies from 1 in 14 to 1 in 5. Results were based on the formula $\frac{W}{C \times T^{1.7}}$, and were read off immediately, timing being effected by field telephone and stop watch, an official with a slide rule being posted at the finishing tape. The results were as follows:

CLASS 1.—SOLO, NOT EXCEEDING 350 C.C.—1, Sorland Pitt (Velocette); 2, J. Montgomery (Douglas); novice prize, Borland Pitt.

CLASS 2.—SOLO, NOT EXCEEDING 600 C.C.—1, A. McCulloch (3½ James); 2, A. S. Brown (Alldays-Matchless); 3, J. W. Walker (Norton); novice prize, A. S. Brown.

CLASS 3.—SOLO, UNLIMITED.—1, J. W. Walker (Norton); 2, Jas. Wright (Indian); 3, A. McCulloch (James); novice prize, J. W. Walker.

CLASS 4.—SIDECARS, NOT EXCEEDING 600 C.C.—1, Jas. Spence (4 A.J.S.); 2, M. Simons (Triumph); novice prize, M. Simons.

CLASS 5.—SIDECARS, UNLIMITED.—1, Geo. Grinton (Harley-Davidson); 2, J. Barclay (6 A.J.S.); 3, M. Fraser (8 Enfield); novice prize, M. Fraser.

SPECIAL PRIZES.—McLean Challenge Cup, for best performance by a member, A. McCulloch (3½ James). Best performance by a private owner, A. McCulloch. Fastest time of the day, J. McKenzie (8 Enfield).

Blackburn and District M.C.C.

We are advised that a reliability trial run, promoted by Blackburn and District Motor Cycling Club, has been fixed for September 30th. There will be ten classes for various kinds of machines. A cup is offered by Messrs. H. Collier and Sons, and gold medals by various officials and makers of cars. There is also a section for motor scooters. The event will take place on Waddington Fells.

Dunheved and District M.C.C.

Launceston has the distinction of having the only motor cycle club in Cornwall This is the Dunheved and District M.C.C., which was formed recently. Owing to the approach of winter it is not expected that many runs will be arranged this year, but the club is being put on a sound basis for next season. The membership already exceeds thirty, and, it is anticipated, will shortly be doubled. The hon. sec. is Mr. Maurice Prout.

Bath and West of England M.C.

Inaugurated only about a month ago, the Bath and West of England M.C. has soon got to work with competitions for its 125 members. On the 6th inst. the club held a successful hill-climb, for which twenty-eight entries were received.

Recently the above club held its second hill-climb, on Weston Lane. The results were based on time and formula, $\frac{C \times T^2}{W}$ being used.

The winner (on formula) of the solo class is A. S. Moon (3½ Norton), and he receives the Fuller cup. V. Smith (4 Norton sc.), in the sidecar class, was the winner of an electric lighting outfit. These prizes will be awarded at the inaugural dinner on October 11th.

Figures of merit and times are given below:

SOLOS.

		Time.	Formula.
1.	A. S. Moon (3½ Norton) ..	1m. 19⅘s. ..	114

The newly-formed Horsham Motor Cycle and Cycle Car Club prior to the start of its recent opening run to Bognor.

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

A DANGEROUS CORNER.

Sir,—I would like to call your attention to the dangerous turn over the bridge at the Blacksmith's Arms, Swainby. The point is on the Northallerton-Redcar road. I have only been licensee here a fortnight and have seen a few spills, notably with sidecars.

Being a motor cyclist myself, I should like you to issue a caution to readers using the road. E. D. ELLISON.

AN ECHO OF THE TEAM TRIAL.

Sir,—In your report of the M.C.C. Team Trial, under "Notes on the Course" (page 286), it is stated "Dalby and Clulee were seen returning to the starter during the third lap." I wish to point out that Mr. Clulee did not ride in the trial; in fact, never left Birmingham; while I myself finished all three laps on time, along with Mr. Kershaw (Verus), being the two of the South Birmingham M.C.C. to do so. G. DALBY.

"CICETER."

Sir,—Regarding spelling and pronunciation of Cirencester, I have lived for many years in the neighbourhood of Reading (no great way from Cirencester), and the only rendering I have ever come across was Sissister! F. SIMPSON.

[Cirencester is pronounced as spelt, and also in the two ways given by our correspondents. Similar variations occur in many other names, *e.g.*, Uttoxeter should be Uxeter and Abergavenny Abergenny, but they are frequently pronounced as spelt.—ED.]

SPEED WOBBLE.

Sir,—I noticed a letter a week or two ago regarding speed wobble on a Rudge Multi. This happened to me once or twice after changing from a 1913 to a 1916 model, and seemed to be entirely due to holding the handle-bars too tightly, possibly owing to nervousness on the new machine. In any case, it has never occurred since I adopted a lighter grip, and the machine can be ridden "hands off" indefinitely at any speed from 25 m.p.h. upwards. J. H. H. GOODALL.

Sir,—I should say the wobbling referred to on August 21st was caused by the engine braking effect of closing the throttle passing through the belt to the rear wheel. Closing the throttle suddenly is almost equivalent to a sudden application of the rear brake. It may interest "G.E.S." to know that T.T. riders in the Isle of Man corner quickly and reduce speed suddenly by not only closing the throttle but by changing to a lower gear ratio. This is a system of braking and cornering that is most punishing to the transmission and engine, but is resorted to in the hope that the parts subjected to such brutal treatment will stand for the duration of the race. It is safer to do it with a belt than any other form of drive.

Coventry. W.G.

THE SIX DAYS TRIALS.

Sir,—For the present day machine I consider the course of the Six Days Trials a good joy ride. What is 700 odd miles in six days to a trade rider, for instance? Why, ten years ago, I did, many a time, 180 miles in a day on a 1¾ h.p. F.N. The same machine would climb the Cat and Fiddle hill without a stroke of the pedals, which I did in the Liverpool M.C.C. Trial. My name will be found in the motor cyclists' register, Mow Cop (Railway Inn), as I climbed up to it from the station. At that time only one car had ever climbed it—a six-cylinder Simplex. Mr. Philpott, Mr. Blake, Mr. Pohjoy, and Mr. Fehr—names familiar to you—will no doubt remember these performances on a 1¾ h.p. motor cycle if they cast their memory back to seasons 1908-09. I might add I have been a constant reader of your wonderful paper from Number One.

HENRY EVANS.

IRISH TOURISTS' BEST ROUTE.

Sir,—With reference to the letter by Mr. R. Martin headed "A Warning" on page 253 of *The Motor Cycle*, September 4th, the annoyance and inconvenience experienced by Mr. Martin may be obviated by travelling to Belfast *via* Liverpool, by which route I have repeatedly taken my Harley outfit, as it runs at less cost than that paid in the first instance by Mr. Martin. J. WILLEY.

A MOTOR CYCLE CLUB FOR THE ROYAL NAVY.

Sir,—The letters from Lieut. Evans-Greaves and others regarding a motor cycle club for the Navy have put forth quite a practical suggestion, which would be most welcome to a great many Royal Navyites, inasmuch as it would afford them much needed facilities for exercise after periods of strain and stress in the congested atmosphere of a battleship or destroyer. I shall be glad to add my name to that of your former correspondent to help in any way the furtherance of the project.

ALFRED KELCEY,
Engine Room Artificer.

THE VALUE OF AUTOMOBILE ASSOCIATIONS.

Sir,—I read Mr. Charles Brown's letter with interest after my own experience. I joined the A.C.U. in March. On August 23rd my 2¾ h.p. motor bicycle broke its frame one mile north of Cosham on my way to Portsmouth. A message was sent into Cosham by a passing motor cyclist, and a garage sent a car out and carried the machine and self to the nearest repair depot in Portsmouth.

In reply to my letter relating the above, the secretary of the R.A.C. replies: "The above scheme does not cover the conveyance of the cycle. It is only to provide means of conveyance for driver and passengers so as to prevent their being stranded by the roadside. We regret we are unable to meet the expense to which you refer."

The A.C.U. advertisement reads: "In case of breakdown or accident your machine is taken to nearest garage and a car is placed at your disposal," etc.

I only asked for expenses for carriage of the machine. I was willing to bear the expense of the rest of my own journey to the Isle of Wight. L. OLIVER.

Sir,—May I relate an experience of mine which shows the advisability of all motor cyclists joining the A.C.U.?

I was touring in the West of England, and at Weston-super-Mare was stopped by the police for having my head and rear light out. I communicated at once with the A.C.U., and a solicitor was appointed to watch the case on my behalf. Living in Sheffield, I did not intend to travel nearly 200 miles to attend the court. I have just heard from the solicitors that they were successful in getting the summons dismissed. Had I no legal representation, or had I to find a solicitor on my own, I might have been considerably more out of pocket than my subscription to the A.C.U.

Had the friend of "Fair Play" been represented at the court, as related in your issue of August 28th, he might not have had such an expensive awakening. Of course, it was an accident that delayed his appearance, and it is in just those accidents that the A.C.U. steps in with its valuable help. MEMBER A.C.U.

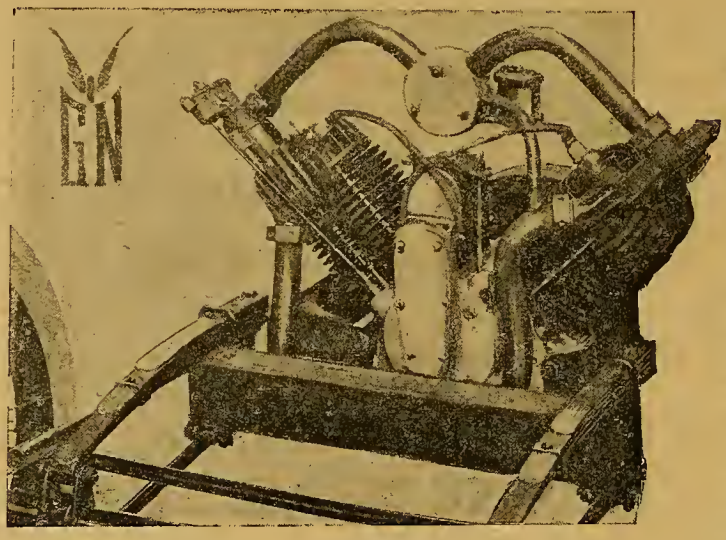
who should take advantage of this wonderful new offer. These goggles are light, comfortable, and have a larger field of vision than any other goggle on the market.

Write at once and secure a pair. Model "A3" is particularly suitable for ladies.

The TRIPLEX SAFETY GLASS Co. Ltd

1, ALBERMARLE STREET, LONDON, W.1.



G.N. Ltd., Etna Works, Albert Rd., Hendon, N.W.4.

The G.N. Engine is an outstanding example of the vibrationless and successful air-cooled engine; it is, moreover, unique in its supreme accessibility.

Its efficiency is shown by its Hill Climbing Successes, and by its use for special purposes during the war, during which time several minor improvements were embodied.

The illustration shows clearly the deep finned cylinders and ports, with exhaust ports and plugs in the most favourable position for cooling, the enclosed inlet rockers and the hot air jacket for the induction elbow.

WE QUOTE PRICES.

VIVIAN HARDIE & LANE, Ltd.

DOUGLAS. **(The World's best opposed twin.)** 2¾ h.p., **£72.** 4 h.p. Post War Combination with new clutch, **£123.**

A few good 1919 used Combinations in stock.

"G.L." Now on view. 7 Patents applied for. 5-6 h.p. Twin, 3 speeds and kick starter. Internal expanding rear brake, patent emergency brake on engine shaft. Patent spring forks. Streamline design, light, but immensely strong. Detachable and interchangeable wheels. Luxurious "flying boat" sidecar.

LEVIS. 2-stroke. The Victorious Popular Model. Price **£44-13-0.**

ALECTO. 2-stroke. 3½ h.p., 76 x 76 mm. Countershaft Gear box. Druid Forks. Very fast and powerful. Price **£83-7-0.**

TWIN CYLINDER SOLO AND SIDECAR MOUNTS IN THE SIX DAYS TRIALS.

D. H. Noble and his 5-6 h.p. Rover, which embodies several features that will probably be standardised. These include wider mudguards and a chain guard in lieu of the enclosed case.

The 8 h.p. New Imperial with Henderson sidecar ridden by W. R. Haggas. A very complete accumulator lighting equipment was fitted to this outfit.

SPARE PARTS.

Sir,—I recently broke a pulley flange of my N.S.U. gear while on tour. A brazed repair kept me on the road, but the job was vilely done, and I considered a new flange necessary. This I tried to get in London from a firm which advertises its ability to carry out repairs to these gears. They quoted 12s. for a second-hand flange. I happened to have Messrs. Bradbury's list of parts, and found their price was 8s. 6d. A postal order sent on August 25th brought a card to the effect that the annual holiday was in being, but that my order would, etc., etc. Imagine my surprise when, on Friday, September 5th, the flange arrived, and my delight in finding it a perfect fit.

The fact that this firm at present makes the complete gear and supplies spare parts at reasonable prices does not appear to be generally known. A. H. NELSON.

Sir,—Having recently seen a number of letters in *The Motor Cycle* from readers who complain of unsatisfactory treatment by manufacturers, I wish to mention one firm at least who spare no pains to satisfy their customers.

I have an old Triumph, for which I required some small parts, and on writing to the Triumph Cycle Co. I received these in the course of a few days.

I had occasion to remove the pulley, and finding this very tightly wedged on, I wrote to the Triumph Co., asking their advice, as I was afraid to use force lest I might fracture the pulley.

I received by return an extractor and a courteous letter, and although I wrote asking what was the cost of the tool I was not charged anything for it.

I have always received a prompt answer to any enquiry for information, no matter how trivial the case, and I am not even the original purchaser of the machine, having bought it second-hand.

I think this admirable service is worthy of note, especially in these times, when material is scarce and the demand so great.

I have no interest whatever in the Triumph Co., beyond being a well satisfied user of their splendid machine.

Co. Wicklow. T.T.

Sir,—As there is often delay and inconvenience in the obtaining of spare parts, I think it advisable that we should make known the manufacturers who treat their customers well, even in small matters, and are prompt in their despatch. I had occasion a little while ago to send to the Rex Motor Manufacturing Co., of Coventry, for a new inlet valve cap for a 1908 Rex, and on receipt of cash they promptly forwarded the article; but unfortunately I sent the wrong date of machine, and consequently I received the wrong pattern. I informed them of this, so was asked to send the old cap along, which I did, and in the course of a few days I received the right cap with the old one returned, with an apology for the delay. Had I not made the mistake it would have caused me no delay whatever. I add the usual disclaimer. HAROLD H. LEY.

Sir,—Whilst touring in the South of England on a P. and M. motor cycle I had the misfortune to break the front forks through an accident. This occurred the Saturday afternoon before August Bank Holiday. A letter was sent to Messrs. Phelon and Moore the same evening, which was received by them on August Bank Holiday. The forks were despatched the same morning, and the machine was ready for the road on the following Wednesday afternoon. I have heard numerous complaints respecting the despatching of spares, but have always found Messrs. Phelon and Moore very prompt. C. A. PHILLIPSON.

WHO WAS TO BLAME? AN UNUSUAL EXPERIENCE.

Sir,—A few weeks ago I bought a 6 h.p. motor cycle second-hand (about 1914 date). The power output was very bad, and the first thing I did was to tune up the carburetter, a Binks three-jet. The late owner had got the jets somewhat mixed, and the sizes made me wonder if he had been using a stream of petrol to *wash* the inside of his engine. When I got this about right I removed the exhaust pipes, and went for a short run, with very gratifying results. I replaced the exhaust pipes, and went out for the afternoon. My surprise and disgust were great when I found the engine ran nearly as badly as ever! I selected a moderate hill on a deserted road and began testing. First I went up on two cylinders and then on each one separately, first with the exhaust pipes on and then without. This soon showed that when the back exhaust pipe was on that cylinder gave no power at all, so I drove home without it, and proceeded to look for carbon. Imagine my utter stupefaction when, on taking down all the piping, I discovered that the lug where the back pipe ran into the other was *solid!* The pipe simply came to a dead end inside the lug. And this after several years' use! No wonder the previous owner had been fitting big jets to increase the power—and then sold the machine. The puzzle is how it ever came to be running like that at all; surely the makers would never be guilty—and yet—well, I am left puzzling. At any rate, I do not think it was a practical joke, as the pipe had most obviously been fixed for a long time, and the state of the carburetter was additional proof.

Sheffield. C.S.

LUMINOUS SPEEDOMETER DIAL.

Sir,—As a constant reader of *The Motor Cycle* and an ardent rider myself I would suggest that a speedometer with luminous figures and pointer would be an enormous asset to those motor cyclists who of necessity have a considerable amount of riding to do at night.

Cannot some enterprising British firm undertake the production of these speedometers, instead of letting the Americans or, quite possibly, the Germans, do it for us?

As a type of speedometer, that with a black dial and white luminous figures and pointer would be most suitable I think, as the speed can then be read at a glance during the day as well as at night. Personally, I have tried a small electric light above the speedometer at night, but have never found it very satisfactory. I would like to add that from my entire absence of trouble whilst riding with a luminous wrist watch, the dial of the speedometer would be found equally reliable. DOUGLAS BROWN.

BENZOLE.

Sir,—I have read with some surprise that it is proposed to carry out a 5,000 miles trial of benzole. This trial appears to me to be a waste of time and money.

One of the objects of the trial is, I see, to test the effect of benzole on tank, engine, carburetter, etc., but as the trial will only last about a month it will be of little value. There must be scores of motor cyclists who have used benzole for tens of thousands of miles; their records and remarks if tabulated would be worth a dozen short trials.

I have ridden a 1913 F.E. Triumph practically every day for six and a half years, have covered over 75,000 miles on it, and from the first day I rode the machine I have always used benzole when obtainable. Like everyone else, for a period during the war I had to use piff water.

In the good old days I bought benzole in 50 gallon drums from a firm called Robinson Bros., West Bromwich, at about a shilling a gallon. Now one can buy it, at a price, at any roadside garage.

The original tank and carburetter are still on the machine, and both are still in perfect condition. I have had two new cylinders and five new pistons, these replacements being necessary on account of wear of the cylinder walls. I have ridden in all weathers including hard frosts, and have never found any objection to the use of benzole.

On a long run I can do 100 miles to the gallon on benzole, while on piff water during the war I hardly managed to get seventy-five. My experience proves that benzole has no ill effects on a Triumph.

It would be most interesting if confirmed benzole users who ride other makes of machines would give their experiences. A. W. TOMLINSON.

STEERING ON HAIRPINS.

Sir,—With regard to "Janey's" suggestions and queries *apropos* this subject in the Correspondence columns of August 21st, I do not think the pack carried on my Douglas during the Scottish Six Days trials in any way influenced my judgment concerning the steering of the machine, as it was carried only during the three days of the trial which found us changing hotels. What "Janey" says concerning the weight on the front wheel nevertheless affords food for reflection, though his opinion is entirely the reverse from that of many riders. I agree with him that the P. and M. and the Scott are two of the best machines for difficult corner work, and both, curiously enough, carry their weight well forward; yet experience with other makes produces such a chaos of contradictory evidence that one hesitates in giving an opinion. Nor does it follow that a machine which steers easily in the ordinary course of touring is going to prove all that might be desired for difficult corner work such as one encounters during the classic Scottish event.

What probably matters more than anything else is the position of the rider. There are some machines which one can "get hold of" so that rider and machine are part and parcel as regards weight distribution and balance; there are other machines which strike one as being little more than a framework of bony protrusions, which, at the best, one can merely sit on and steer. A natural and comfortable riding position, by which one's weight is sufficiently forward to impart an impression of maximum control of the front wheel, is perhaps the chief thing, and, given this, I do not think the weight centres of the machine matter to within a millimetre or two.

In case these remarks may be thought to cast a reflection on the steering of the new Douglas, let me add that the very slight discomfort I experienced on the most difficult corners was, I believe, entirely due to the fact that the riding position was adjusted to the dimensions of a rider less elongated of limb than myself. Had there been leisure for slight readjustments probably the defect would not have been noticeable. There is no doubt whatever that, as "Janey" infers, a heavy pack on the carrier does upset the extreme nicety of steering—probably more than does an experienced pillion passenger, from which fate deliver me!

CHINOOK.

CONCESSIONS TO DESPATCH RIDERS.

Sir,—I am afraid I must disagree with the latter part of "Ex-D.R.'s" reply to "Discharged Highlander" in your issue of the 11th inst.

About July 10th I went to the offices of the War Motors Association in High Holborn, and booked a conntershaft Triumph, paying a deposit of £10.

The gentlemen in this department were real good fellows, for in five days I was told I could fetch the machine from the depot at Slough.

I found it a 1918 model in tip-top condition, and I rode it back to my home at Dulwich.

The tyres were slightly perished, but I did 2,000 miles before I discarded them.

In August I made several long runs, travelling from Exeter to Margate in one day without the least trouble—a distance of 260 miles.

I think "Discharged Highlander" will find that he also can get a machine from the W.M.A. if he tries.

As regards price, this machine cost me 60 gns. plus 2½%. Hub gear Triumphs were about £25-£30. Surely these prices were bargain prices, and I for one have not been taken in over the deal.

I should advise "Ex-D.R." to go direct to the W.M.A., although now, no doubt, they have quite a waiting list.

Dulwich, S.E. A SATISFIED D.R.

Sir,—With reference to "Ex-D.R.'s" letter on Sept. 11th, *re* Government motor cycles and the War Motors Association, I may say that I ordered a 2¾ h.p. Douglas in July and got delivery early this month.

The machine, which is a rebuilt one, has been overhauled, re-enamelled, and all worn parts renewed by the makers, is in all respects equal to a new machine, and has given every satisfaction.

The delay in delivery is no fault of the W.M.A., but of the Government Department concerned. The price, 45 gns. plus 2½%, strikes me as extremely moderate, considering similar machines are advertised by dealers at about 70 gns.

The only criticism I would offer is that the W.M.A. make better provision at Grove Park for taking away the machines, as a grateful Government refuse to give one any petrol or oil, and unless fuel is taken it is necessary to push the machine to the nearest garage.

I understand that the concession is not confined to ex-D.R.'s, but that a motor cycle or car may be purchased through the W.M.A. by any ex-officer or man.

Richmond. ANOTHER EX-D.R.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

What do you know about your motor?

An Important Work for every Motor Cyclist.

The time is past when it required an expert engineer to drive a car, but a working knowledge of the various parts of a car and their functions is still essential to really successful driving, and the importance of this work to every owner and driver of a motor car, cycle, or cycle car can hardly be over-estimated.

"The Book of the Motor Car" is the first really comprehensive work on motor cars, cycle cars, and motor cycles ever published. By the careful study of its chapters the rawest amateur can learn the principles upon which his car works; but at the same time it is so comprehensive and so striking in its detail that even the skilled man will find it a book of enthralling interest and extreme utility, while the practical motorist will find it quite indispensable. It should be as much a part of the equipment of a garage as an oilcan or a lifting jack. Reading its chapters, even the most expert driver will find himself gaining a fuller understanding of points that he thought he understood already, and learning hints that will enable him to increase the efficiency of his mount in a surprising manner.

Driving and Repairs.

"The Book of the Motor Car" is full of invaluable information on all problems of driving and repairing a car, instructions being given for all possible difficulties in language that can be understood even by the most unmechanical mind. The following are a few of the subjects dealt with: Cylinders, valves of all kinds, different types of engines, carburetters, ignition, silencers, gear and clutches, radiators, cooling systems, brakes, lubrication, lighting systems, wheels, tyres, fuels and how to use them, tools, and repair appliances, etc., etc.

Cycle Cars and Motor Cycles.

The work pays full attention to motor cycles and cycle cars, full details and instruction being given for all those points wherein they must be treated differently from the most powerful motor car. In these and all other respects "The Book of the Motor Car" is in line with the very latest discoveries in motor engineering. It is profusely illustrated with full-page plates, drawings, in plan section and elevation, diagrams, and photographs, as well as a series of sectional movable models in colour.

A FREE BOOKLET.

QUADRANT

MOTOR CYCLES

THE HIGH STANDARD OF ENGINEERING EXCELLENCE ATTAINED IN THE POST-WAR

QUADRANT

IS THE RESULT OF 20 YEARS OF MANUFACTURING :: EXPERIENCE. ::

4½ h.p. PEACE MODEL.

ITS REPUTATION WON IN COMPETITIVE TRIALS PREVIOUS TO THE WAR.

TO WHICH IS ADDED THE EXPERIENCE GAINED IN THE MANUFACTURE OF AEROPLANE ENGINES DURING THE WAR

LAWLEY STREET, BIRMINGHAM.

This Belt for your Engine's Sake !

A poor belt will fail to grip the pulley ; it will not let your engine get fair play. The

PEDLEY

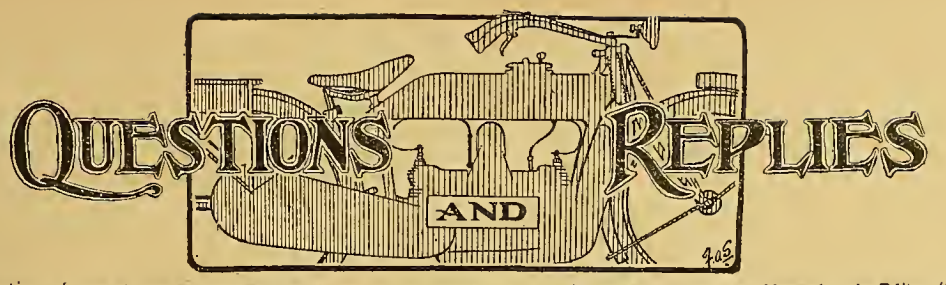
BELT—in which every manufacturing detail has been carried out to the highest degree of excellence—will reduce to a minimum, the possibility of wasting power.

J. PEDLEY & SON, Ltd.,
Oxford Works, Great Charles Street, BIRMINGHAM.
London Depôt :
30, Holywell Lane,
Great Eastern St.
London,
E.C.2.

900 Miles, never even required Tightening

That was the service a Brand New Pedley ¾-in. Belt recently gave on a 2½ h.p. "Levis," which completed the London to Edinburgh run, and then was driven to Exeter, making a total distance of 900 miles. The rider tells us that the Belt gave no trouble whatsoever on the road, and when taken off was found to be in perfect condition.

NO STRETCH—NO PULLING OUT.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Broken Timing Cover.

The timing cover of my motor cycle having cracked across the centre, I would be very grateful if you would let me know how to repair it. I have tried solder, but it will not hold on aluminium.—F.G.

What you must do is to have the timing case cover welded. You cannot solder aluminium by ordinary means. Aluminium solder might be used, but welding is better.

Converting a Triumph.

I should be very much obliged if you would let me know if a 1914 Triumph engine can be fitted into a Triumph frame of present design, *i.e.*, one made to carry the countershaft gear?—C.S.B.

The 1914 Triumph engine could no doubt be fitted in the later pattern frames, but we are not at all certain that the main shaft bearing will stand up to continued work on account of the overhang of the drive, if used with the countershaft gear.

Irregular Running.

I have a 1913 New Hudson, fitted with B. and B. carburetter and Bosch magneto. The engine usually runs perfectly, but lately, at irregular intervals, does not develop its usual power. The engine gives the writer the idea that it is "pulling back," instead of all the power being used to drive forward. The machine will be running smoothly when, without any touching of the controls or ignition levers, a decrease in the speed will suddenly occur, and will last for about twenty or thirty yards. It will then return to the original speed and run for about the same distance, and then will again slow up. This goes on alternately. The whole time the engine appears to be running quite well and not misfiring, and nothing is noticeable except for the loss and gain of speed. Usually, on advancing the ignition, the speed of the machine is at once increased, but if the spark is advanced while the above loss and gain of speed is taking place, it has no effect. The cylinder is very clean, the piston rings are in good order, the compression is excellent, the jet clear, and the ignition is perfect.—R.W.M.

The only solution we can suggest is that there is a temporary stoppage in the jet due to some floating obstruction, which temporarily impedes the flow of petrol.

Magneto Switch.

I have a 1919 Levis with an E.I.C. magneto to which I have fitted a magneto cut-out. On switching it off when out in a heavy shower, I received an electric shock. (1.) What is the reason for this? (2.) Is the switch in any way bad for the magneto or engine?—J.F.B.H.

(1.) The reason for this is that owing to the wet there was a leakage of electric current, a by no means uncommon occurrence on a motor cycle. (2.) The switch in no way affects the magneto, but indiscriminate use of ignition switches for controlling speed throws very sudden and severe strains on engine and transmission.

Clutch Slip.

My 1917 B.S.A. sidecar outfit has a tendency to clutch slip when climbing fairly steep hills. This only occurs when it is necessary to change down to middle and bottom gears. If I can get a fair start, it will climb the same hills on top, but if checked for any reason, and it is necessary to change down, the clutch commences to slip. I have had the gear box down, but am unable to find any means of adjusting the clutch for wear. (1.) Will it be necessary to renew the springs? (2.) Or the clutch plates? (3.) Also must I renew the whole of the plates, or would it be sufficient to add several new plates?—C.W.R.E.

With regard to the lubrication and care of the gear, we should recommend you to bear the following hints in mind: The gear must not be filled with grease. Use only B.S.A. special lubricating oil (not thick engine oil), injecting this liberally whilst the engine is running, with the high gear in and the clutch out. To do this, remove the four nuts and spring washers on the inspection cover and lift this off the studs, taking particular care that the washers or nuts do not drop into the gear box. At least every 1,000 miles thoroughly flush with paraffin (the engine should be running), meanwhile working the clutch lever in and out and changing gears. Carefully drain by means of the plug provided and relubricate. When leaving the machine after use always let the clutch *in* to relieve spring pressure. Do not slip the clutch unnecessarily. It is necessary occasionally to test the adjustment of the clutch control. The small screw in the control nut is provided for this purpose. This should be adjusted to allow a slight back lash to be felt when the clutch is in, otherwise the full spring pressure will not be operating on the plates. (1 and 2.) If this procedure does not remedy the matter, then you must try renewing the springs or fitting new clutch plates. (3.) It is impossible to say. It seems as if a complete set might be necessary, but you might try one or two extra ones.

An Old Engine.

I have purchased a motor cycle, Chater-Lea frame, but the crank case has cast on it the initials P.F. It is a twin-cylinder with a bore of 3$\frac{1}{8}$in. and stroke of 3$\frac{3}{4}$in. (1.) Is the engine a Peugeot? (2.) What is its h.p.? (3.) What is the address of a firm likely to supply spares? (4.) How must I set the valves (exhaust)? The inlet valves are automatic.—W.E.F.

(1.) The engine is a Peugeot. (2.) It is about 7 h.p., 943 c.c. (3.) Spare parts for these engines are practically unobtainable. (4.) Time the exhaust valves so that they close just before the piston reaches the top of the stroke.

Completion of Purchase.

I bought a second-hand motor cycle from a small garage owner, giving a cheque for £85 in return. I did not take possession at once, owing to some small repairs which were being done on it. On further examination, while waiting, I discovered a badly cracked frame member, whereas the machine had been described as perfect with the exception of the aforementioned small repairs necessary. I immediately walked out of the garage and wired to my bank and stopped the cheque. I did not inform the garage owner of what I had done, and he did not know till he found the cheque stopped four days later. During that time, apparently, he had enquiries about the machine, but replied "sold." Now, he has sold the machine for £80, and holds me liable for the £5 difference. Am I liable? I shall be very grateful if you would give me expert advice, as I cannot afford to pay the costs if I lose the case in the courts, and would settle it outside, therefore, preferably to losing it.—B.C.L.B.

Having given a cheque to cover the price of the machine, you are liable to complete the purchase, even though you have stopped the cheque, unless, of course, you can prove definitely that there was some misrepresentation on the part of the dealer.

Lighting from Magneto.

? I have a B.L.I.C. aeroplane magneto which I am converting into a lighting set for my Morgan. I have removed the high-tension (secondary) winding from the armature, and also the condenser, and have filled up the space with low-tension wire. I now want your advice about the shunt coil. I have an old medical coil and wonder if I introduce the coil in the circuit—removing the make and break, of course—whether this will function as a governor to keep the voltage nearly constant. I do not intend, of course, to charge accumulators, as it is an H armature.—T.W.E.B.

We do not quite follow your meaning as to a "shunt" coil; the shunt coils of a generator in the ordinary sense being the field-magnet coils, which in this case are non-existent, permanent magnets taking their place. What you probably have in mind is a "choking coil," as sometimes used in an alternating current circuit to regulate and steady the voltage. We presume you only think of using the primary circuit of the old medical coil, but we do not think it would be successful, as the effect would not be powerful enough, while the high-tension winding would be too fine for the purpose. You can, however, make the experiment without much trouble. On account of the permanent field and the armature reaction at high speeds, the voltage of such a generator will keep fairly constant without any other regulation.

READER'S REPLY.

Consumption on Two-strokes.

Re the letter signed "H.M.," in the issue for September 11th, "Questions and Replies," as a rider of (presumably) the same mount—1919 2½ h.p. Sparkbrook-Villiers—I can give my own experience of this model. I cannot understand the latter part of his first statement. How does he mean the engine stops? Is it when he first starts to wheel it, or after he has wheeled it a few feet? Anyone knows that the low gear requires a good deal more turning round than the high gear; therefore if it is at the commencement of the performance that the stoppage occurs it is probably belt or tyre slip which is responsible. If the machine runs under power all right on low gear there is obviously nothing the matter with the gear. Referring to his remark about a stop sometimes occurring while running when he changes down, I should say it is because he shuts off the mixture too much, which, added to the upsetting of the regular explosions by the lifting of the decompressor, necessitates a few engine revolutions before normal internal conditions in the engine are established again. The only slight difficulty I have ever had was to get the low gear to engage without undue pressure; but by means of adjusting the lever and frequent usage this has now disappeared. I have ridden this machine some 2,500 miles, have never had a stop due to mechanical trouble, and have only had one due to puncture. Its hill-climbing powers are remarkable. I used to look with contempt upon a 2½ h.p. two-stroke, but have revised my opinion. I have ridden other well-known makes, but prefer the Villiers engine. As regards his petrol consumption, there is something radically wrong. I have never touched my carburetter—a B. and B. top feed—it is just as fitted at the works, and I have always had more than double his miles per gallon. Your statement that two-strokes are more extravagant than four-strokes is probably correct, given identical carburation efficiency, but my experience is that the whole problem of miles per gallon is much more a question of carburetter design than engine design, and that it is a problem that even our foremost experts have by no means exhausted. I used to think 75 m.p.g. quite good. When I got 100 miles of Yorkshire touring out of two and a half quarts I opened my eyes. Regarding oiling, surely "one drop every three minutes" is not serious? Should it not be "one drop every three seconds"? It would be much nearer. "H.M." should adjust his drip between 1½ and 2 on the register—nearer the latter in normal weather, and rather over in really cold weather. This is equivalent to what you instruct.—H. F. MOHUN.

EXPERIENCES WANTED.

Speed, reliability, and running cost of the Morgan Runabout in a very billy district over bad roads, *e.g.*, N. Devon. —A.L.C.

RECOMMENDED ROUTES.

LEEDS TO LLANDUDNO.—C.C.

Leeds, Huddersfield, Staleybridge, Stockport, Altrincham, Northwich, Chester, Mold, St. Asaph, Abergele, Llandudno.

HUDDERSFIELD TO IPSWICH.—J.D.E.

Huddersfield, Barnsley, Doncaster, Bawtry, E. Retford, Newark, Sleaford, Swineshead, King's Lynn, Thetford, Ixworth, Stowmarket, Ipswich.

WARWICK TO WEYMOUTH.—J.W.

Warwick, Stratford, Evesham, Cheltenham, Painswick, Stroud, Nailsworth, Bath, Radstock, Shepton Mallet, Castle Cary, Queen Camel, Sherborne, Cerne Abbas, Dorchester, Weymouth.

IPSWICH TO BOURNEMOUTH.—G.H.

Ipswich, Colchester, Braintree, Stortford, Hertford, St. Albans, Watford, Rickmansworth, Uxbridge, Colnbrook, Staines, Basingstoke, Andover, Amesbury, Salisbury, Fordingbridge, Ringwood, Christchurch, Bournemouth.

LEEDS TO FRAMLINGHAM.—H.W.P.

Leeds, Pontefract, Doncaster, Bawtry, Retford, Tuxford, Newark, Grantham, Stamford, Wansford, Huntingdon, Cambridge, Newmarket, Bury St. Edmunds, Stowmarket, Stonham, Framlingham. Approximately 190 miles.

LONDON (Kensington) TO HASTINGS.—C.J.P.

Kensington (Church Street), Earl's Court Road, Redcliffe Gardens, Wandsworth Bridge Road, Wandsworth Bridge, Wandsworth, Trinity Road, Wandsworth Common, Tooting Bec, Streatham, Croydon, West Wickham, Farnborough, Sevenoaks, Tonbridge, Lamberhurst, Hurst Green, Battle, Hastings.

TWO HIGH-POWERED SIDECARS IN LAST WEEK'S BIG TRIAL IN WALES.

R. Creak Davis on his 8 h.p. Chater-Lea. Note the transverse exhaust outlet.

H. Reed with the new 8 h.p. Dot-Jap sidecar, a smart machine finished in red.

MOTOR CYCLES FOR SALE.

A.J.S.

1919 A.J.S. Combination, delivered end May, spare wheel, hood, screen, Lucas lamps and horn, as new; £165; fully insured.—Clare, 58, Broad St., Barry, Glam. [X3651

THE MOTOR

PILGRIM'S PROGRESS IN

6 Chapters.

1.

He decides to buy a Motor Cycle, and amon st the advertisements notices the name of

GODFREY's, Ltd.

2.

He discusses with his friends the merits of different machines and agents, and is told to be sure to go to

GODFREY's

3.

He finds wherever he goes amongst Motor Cyclists they all have a good word for

GODFREY's

4.

Motor Cyclists who have had dealings with Godfrey's show him their machines and enthuse over the methods of

GODFREY's

5.

He comes to the very wise conclusion that what everybody says must be true and that there is no firm like

GODFREY's

6.

He becomes a customer and then realises why the name and fame of

GODFREY's

CONTINUES TO GROW.

When sending repairs :-

1. It is advisable to send complete wheel.
2. It is essential that outside fittings such as axle nuts, gear or clutch operative parts, washers, etc., are NOT sent.
3. A letter advising us date despatch, station sent from, and mark and number of hub should be posted, and, MOST IMPORTANT, two labels bearing sender's name and address on reverse of both should be tied to the wheel.

RECOMMENDED BY THE STURMEY-ARCHER Co

We regret, through **heavy pressure on our works at the present time, we cannot undertake repairs at short notice, but you can rest assured that orders will be executed as promptly as possible, while we are now in a position to undertake the immediate repair of Sturmey - Archer 'J.S.' Hubs**

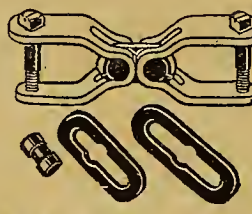
To fit a

FORWARD

Fastener is to forget the word "breakages."

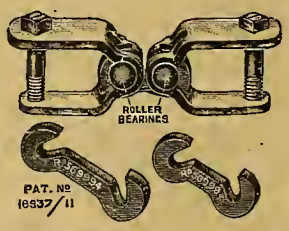
Many a famous speed man, many a hardened tourist, has pinned his faith to them. Their "features" are simply their enormous tensile strength, the outstanding quality of their bearings, and their heavy gauge square head screws.



THE FORWARD

is the world's best That's a big claim, but its record justifies it.

Price 1/6



THE KING HOOK

was the original hook fastener. No imitation has ever ousted it from its position of supremacy.

1919 James 2¼h.p., 2-stroke, complete with P. and H. lamps, Lucas horn, spare belt, inner tube, and other accessories; nearest offer to £60.—Address, Motor, 8, Church St., Colmore Row, Birmingham. [5828

1916 4¼h.p. James Combination, all-chain drive, 3-speed, clutch, kick starter, all lamps, tools, horn, tyres as new, hike been stored nearly 3 years; price £110.—3, Albert Rd., Regent's Park, London, N.W.1. [6404

JAMES 4¼h.p., 1914, 3-speed, countershaft, all chain, hand and foot clutch, kick starter, recently overhauled and re-enamelled by makers, lamps, horn, speedometer; 68 gns.—27, Cranborne Rd., Barking. [6435

1917 James Combination, very little used, perfect condition, ready to drive away; £125.—Vivian Hardie and Lane, Ltd., 24, Woodstock St. (off Oxford St.), New Bond St., London, W.1. 'Phone Mayfair 6559. [6399

JAMES 1919 5-6h.p. Combination, bought new August, not run 500 miles, complete with Klaxon and Lucas lighting set, etc., in perfect condition; best offer over £150.—May be seen at 198, King St., Hammersmith, W. [5743

4¼h.p. James, Canoelet sidecar, 3-speed countershaft, kick start, enclosed chain drive, good tyres, 3 lamps, horn, kept in good condition, smart, runs perfectly; seen any time; trial evenings; £80, lowest. Lee Green 1234.—1, Winn Rd., Lee. [6229

J.A.P.

6h.p. J.A.P., 1915 Coach Combination, 3-speed, K.S., screen, etc., perfect; £110.—82, Caledonian Rd., N.1. [6356

J.A.P. 2¾h.p., condition as new, decompressor, drip feed, tyres excellent; sacrifice, 40 gns.—Jones, Crossway, Coleford, Bath. [X3522

J.A.P. 6h.p. Twin, 2-speed, clutch, chain drive, Bosch, Amac; neglected condition; offers.—Henshall, 19, Greenvale Rd., Eltham, London. [6911

8h.p. J.A.P., clutch, new heavy Dunlops, discs, electric lighting, horn, tools; any trial; £50; Cowes district.—Box L4,326, c/o *The Motor Cycle.* [5689

THE MOTOR CYCLE
ESTABLISHED IN 1903
AND FOR OVER SIX YEARS THE ONLY PAPER SOLELY DEVOTED TO THE PASTIME

Competitions in 1920.

IT is undoubtedly true that this year's competitions, on the whole, have not been too well supported, and probably the reason for this lies in the fact that motor cyclists have not been able to get delivery of new machines. Next year it is to be hoped there will be an abundance of new motor cycles, and in consequence competitions should have ample support. The Auto Cycle Union has already settled on its programme provisionally, and announces four main events for 1920, *e.g.*, the Tourist Trophy race in May, the Six Days Trial in August, a lightweight event at a date to be fixed later, and a scooter trial.

The Auto Cycle Union organises trials for a serious purpose: not to provide sport and pleasure for the entrants, but in order to discover the weak points of design in the shortest possible time, the object being to indicate to manufacturers (who generally are apt to be a little too well satisfied with their products before entering these knock-out competitions) just where their weakness lies, so that their next year's models may undergo the desired improvements.

In a lesser degree the competitions organised by the local clubs seek to do likewise, and while local enterprise in this direction should be encouraged, the trade must not be hampered by a glut of competitions. This is a point which must be guarded against next year if we do not wish to see a repetition of pre-war years, when every week end was filled up with events in all parts of the country which lasted all day and, figuratively, far into the night, and their value discounted by their abundance. Competitions must be kept within reasonable bounds, and the A.C.U. has, in its wisdom, decided to grant only twenty permits to affiliated clubs to hold open competitions. These events are to be evenly divided among various districts, and if too many applications are made in any one area, and the local clubs are unable to settle the matter among themselves, a ballot to decide the number of events in that locality will be held to decide the question. This leads up to another important point. The trade has no desire to have to support an unlimited number of motor cycle events, and has left it to a committee of the Cycle and Motor Cycle Manufacturers' and Traders' Union, Ltd., to decide what events should receive trade entries. Unfortunately, this body has not hitherto shown remarkable discretion in the particular events which should be supported, and we may quote as instances the Tourist Trophy races in 1912 and the Scottish trials in 1919, both most deserving events which were held successfully despite the withdrawal of the patronage of this institution. Surely it would be better to seek the advice of the governing body before deciding what competitions to support.

A Lightweight Trial.

The Motor Cycle has urged the A.C.U. to organise a lightweight trial. The Six Days Trials are supposed to embrace all types of motor cycles, and yet we see that, in the recent event at Llandrindod Wells, the lightest motor cycle scaled over 170 lb.! This tends to show that motor bicycles are not being developed along the right lines. Weight grows apace, though the exact opposite should be the final aim. Up to the present, comfort and the go-anywhere attribute every motor bicycle has to possess have not been attainable without weight.

The migration of solo riders to passenger machines so noticeable this year is due in some considerable measure to the dearth of light and handy mounts, designed wholly and solely for solo riders and for everyday use. Until we get genuine lightweights which require no exertion to start and handle, and which may be lifted up ordinary steps without undue effort, the greater part of a huge potential market is being neglected. Scooters promise to fill the gap for a time, but in range of action and in the comfort provided they are not to be compared with an efficient lightweight motor bicycle.

An index to the advertisements in this issue will be found on the page facing the back cover.

Conking Out on Hills.

ONE of Kipling's seafaring men, so far as I remember, when some unprofessional action was suggested to him, cocked a fierce eye at his interlocutor and remarked savagely, "McRimmon, what's her virginity to a lassie?" "The warld an' a', the vara warld an' a'!" was the answer. I may be mad, but I am just as jealous on behalf of the honour of motor cycles, and Secretary Loughborough, with certain aid from chosen riders and designers, has stirred me into one big blaze of indignation. In the Six Days, the entered machines were set to ride up Panne Hill slowly and then fast in a stunt known as the "consistent driving test." A number of them failed, or, as the papers naturally put it, overheated, and conked out. The resultant publicity will do serious and, to my mind, gratuitous injury to the industry, sport, and hobby which I love. I proceed to develop this thesis in the succeeding paragraphs.

Baleful Publicity.

LAST Thursday a lady, who is not destitute of technical knowledge, hailed me, "Hullo, 'Ixion,' I thought you were saying last night that the modern motor cycle could climb any hill and never overheated?" I eyed her sourly, foreseeing that some concatenation of circumstances and fools had once more proved me a liar. "Well," I replied sulkily. "*The Times* says most of the Six Day men conked out from overheating on one of the Welsh hills, and that only the official Rolls-Royce got up." When we got down to dots, the Thunderer had, of course, said nothing of the kind; but her version shows how intelligent and unprejudiced people may easily pervert a matter in which they are not intensely interested. Ignorant and prejudiced gossipers will present the hill failures in Wales in far more lurid colours. It is a pity those failures occurred. Let us next enquire why and how so many entrants succumbed on one or more hills.

The Causes.

IN any trial there are a certain percentage of hill failures, due entirely to the chapter of accidents. One man punctures. Another skids. A third shuts his throttle in his excitement when he intends to close off a little air. A fourth changes up into top instead of down into bottom. A fifth has his locking selectors too loosely adjusted, and his gear lever springs into neutral. Another perhaps soots a plug. All such failures are pure accidents: we cannot eliminate them, and we need not worry about them, because, with an entry largely composed of decent riders, they are too few in number to matter, and are overshadowed by the fine climbs which the rest of the men register. Such failures were excessively numerous in the Six Days, perhaps owing to lack of practice and the special excitement which the trial created. But the consistent driving test was directly responsible for the chief *débâcle*, which has spread rumours all over the country to the effect that motor cycles are inefficient hill-climbers. When the riders were set to climb slowly and then accelerate—a trick which very few of us ever essay in normal riding—some of them evinced great clumsiness, and in some cases they brought into high relief certain flaws in the design of their machines.

The A.C.U. Guiltless?

I AM not going to denounce the A.C.U. for importing this trick driving test into a classic trial, and so innocently breeding a host of misconceptions in ignorant minds. I do not, personally, care for the stunt. Its main weakness has already been shown up, as indicated. On the other hand, it is a praiseworthy policy to put a premium on maintenance of tune; and it is difficult to conceive of an alternative test on this point so long as Brooklands is closed; *otherwise a full speed mile on the first morning and the last afternoon are an obvious substitute.* Furthermore, the A.C.U. are possibly right in putting a special value on slow climbing. After all, every machine has to climb slowly when it negotiates a hilly street on cattle market day, if slow climbing on the open road is never necessary. So I do not blame the A.C.U. for smirching the fair fame of the modern motor cycle.

Two Alternatives.

CLEARLY, either the riders were to blame for handling good machines clumsily, or else designers were to blame for entering machines which could not crawl indefinitely on a severe gradient without beginning to conk, when asked for much increased speed as the grade grew invisibly steeper. In either case, the guilt is heavy. I cannot apportion the blame, for I do not know all the engines and riders with sufficient intimacy. But the rider who plays the fool in a classic trial is a public nuisance, especially when there are enough of him to mar the average performance. In several instances sheer bad driving was to blame, and the culprits ought to be ashamed of themselves for not practising beforehand. There is even less excuse for the designers, if the responsibility is theirs. I admit the test was novel, but they had ample warning of it; and it is easy to fake a machine so that the biggest duffer can take it up any gradient at an imperceptible creep. For example, I have a machine in my garage which I dare not have entered for this particular test in its present condition: it will climb any hill in Great Britain fast—indeed, much faster than is safe—but it will not—in its present adjustment—go up a real freak hill slowly. I can make it climb 1 in 5 at a creep any day—merely by timing the ignition rather later, making a small adjustment to the carburetter, and putting on a sidecar sprocket in lieu

Occasional Comments.—

of the solo sprocket. This would have been done as a mere matter of routine common sense if I had entered for the Six Days. On the other hand, I have another machine which is five years old, and has never conked in its life; it has climbed the test hill at Brooklands far more slowly than any machine climbed the Welsh timed hill. If I were a maker who burned to shine in the Six Days, it would have been an engine of this type that I should have entered, rather than one of the sensitive and fiery variety. The task is perfectly childish. We know how to rule out distortion. All we need is a low compression engine with a rational ignition timing and a wide range of ratios, embodying a speed climbing ratio and a genuine emergency ratio. These obvious precautions were not taken. So, the combination of a rather dubious test, a number of not too skilful riders, and the entry of some slightly unsuitable machines, have led to the production of a lamentable impression. Not four people in ten who are aware of the hill failures in Wales understand that the machines could have stormed up the hill if they had been permitted to select their own speed.

A Question of Alignment.

RECENTLY I assisted a friend to reassemble a fairly modern machine after a pretty radical overhaul, and we were horrified to discover that it was impossible to get the engine and gear box sprockets into line without ruthless faking of the frame. The designer had adopted the principle that neither the ordinary owner nor the ordinary garage can be implicity trusted to align a chain. To relieve them from the risk of making blunders he built his gear box into the frame so solidly that it could not be adjusted in any direction. The engine is similarly immovable laterally, but can be slid longitudinally in its cradle. In other words, the alignment of the chains is fixed, but the longitudinal engine adjustment allows the tension of the front chain to be reset. Offhand, this principle seems sound—the snag which we hit was the fact that the chain alignment was very badly out indeed. The engine required to be swung slightly anti-clockwise and the gear box clockwise, both directions being from a plan view; neither adjustment was practicable, short of rebuilding the frame. If we filed the gear box cradle, the gear box would cease to be rigidly held; if we packed the engine slightly lopsided in its cradle we threw illegitimate stresses on the frame. Moreover, skewing the gear box would require the rear wheel to run out of track with the front wheel.

Unfortunately, the most interesting data were not available. In particular the owner cannot say whether the frame was ever true or not; the whole trouble may be due to faulty original construction. I am inclined to favour this explanation, since the mal-alignment was in the reverse direction to that which the pull of the engine might conceivably produce in a weak frame; and on the other hand the owner states that the machine has never been in an accident or sustained a heavy fall. The moral of the incident is clear. First-class design must work on one of two systems. *Either* adjustments must be provided to cope with every conceivable loss of alignment (in which case the gear box must never be rigidly and finally located); *or* else the frame must be very carefully O.K.-ed for truth before issue. It would be interesting to hear the experiences of a first-class overhaul foreman on the point. My poor friend is at present wavering between returning his frame to the makers, and seeing how the short front chain will last when running askew to the tune of rather more than 3/8in. Almost invariably we blame the chain makers for broken chains. Are we justified?

Great interest was displayed in the Six Days Trials by the inhabitants of the various towns through which competitors passed. Kaye Don (5 h.p. Zenith) on left, and R. Creak Davis (8 h.p. Chater-Lea) on right, passing through Builth.

ECHOES OF THE SIX DAYS TRIALS.

Varied Observations and Impressions of the Annual A.C.U. Event.

A SPUR OF PLYNLIMMON, NEAR MACHYNLLETH—the outstanding test of Thursday afternoon's run. Stanley Parker (6 h.p. Enfield sidecar) leading three other riders over the loose shale surface, gradient approximately 1 in 5.

A PRACTICAL RIDER'S DEDUCTIONS.

HOWEVER well organised a trial may be, and however concisely the results are tabulated, it is not always easy for the average motor cyclist to gain a correct impression of the actual performances of a given make of machine.

The question of luck is ever present, and an arrow partially concealed by a spectator, a series of tyre troubles, an unlucky skid or a stop on an observed hill due to a piece of awful road surface, may all help to lose a gold medal. The personal factor, also, is difficult to eliminate, and in addition to the consistent driving test, which caused a good deal of grumbling on the part of the competitors, it must be remembered that a piece of clumsy driving on the part of an amateur driver may be sufficient to spoil the chances of a team.

The A.C.U. took all reasonable precautions to save such misrepresentations in the case of the Six Days Trials, and yet more than one record was spoiled by sheer mischance in the last twenty miles of a very strenuous 730 miles run.

Success of the Two-strokes.

It was so hard, even for those who were present at the event, to gain a true perspective that anyone who relies entirely on published results is very apt to be misled. One of the outstanding features of the trial is the success of two-stroke engines. The Scotts performed with the utmost consistency, and attracted the admiration of all spectators by the manner in which they purred up nearly all hills on top gear, and by their admirable qualities with regard to holding the road. The excellent running of these machines was not confined to the team only, for B. Alan Hill also procured a gold medal, and Jesse Baker was one of the unfortunates who had severe tyre trouble and lost his way on the last day. Pike's little Levis, with a single-cylinder engine of but 62×70 mm., made a most wonderful performance, and even the ascent of Bwlch-y-Groes did not trouble the tiny power unit, though the low gear ratio 15 to 1 is no lower than that of many larger machines. The Levis was a standard machine except for gear ratios, and had seen hard service before the trial, being impressed at the last moment on account of tank trouble which occurred on the new model. Scarcely less wonderful were the performances of Goodman's Velocette and Lidstone's James, both of whom well deserved their gold medals.

These results should do much to popularise the two-stroke, and to encourage the growth of real lightweight motor cycles, for which such engines are admirably suited, for the Six Days Trial is no joy-ride, and any machine which completes the course to time may be considered as an eminently roadworthy article.

G. E. Stobart (5-6 h.p. James sidecar) climbing Constitution Hill, Swansea.

It was rather a disappointment to find so little real novelty in design exhibited by competing machines. The A.B.C. is one of the few newcomers to competition work, which has got out of the pre-war groove. The design of these little machines is excellent, and they are most compact. All detail work is carried out well, and is designed to be part of the machine, instead of being tacked on in a haphazard way wherever there happens to be room. It is particularly unfortunate, therefore, that the two representatives of this firm should have been dogged by bad luck. Emerson was pursued by tyre trouble, and, in spite of his plucky efforts, was unable to save his time, and Fairley suffered a broken oil pipe, which eventually caused an engine seizure.

Weight and Frame Springing.

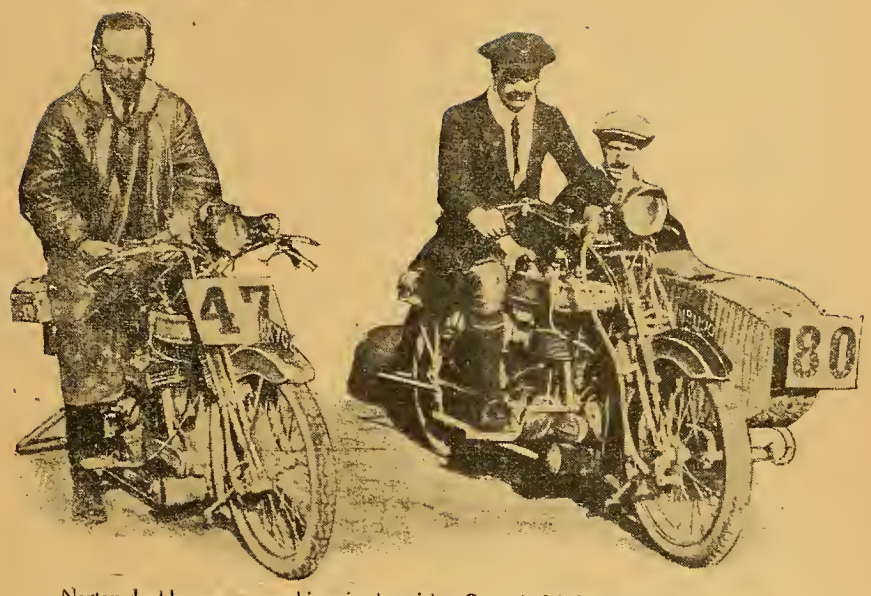
The weights of machines equipped for the road will cause a surprise to those who follow catalogue figures, and there is much room for improvement in this respect. There are many solo riders in this country, and it seems surprising that some enterprising firm does not specialise in a machine for solo purposes only. The main reason against this suggestion is probably that it is impossible to prevent the buying public from attaching a sidecar or carrying an additional passenger on "the bracket." Nevertheless, it is generally agreed amongst enthusiasts that solo machines have been spoiled by being constructed for passenger work, and there would probably be a big sale for a purely solo mount not exceeding 5 h.p.

Spring frames had a moderate representation, but, if this year's riders have a say in the matter, there will be a big increase in numbers in the near future. As might be expected, there were no

Echoes of the Six Days Trials.—

failures with regard to springing systems, and only two on rigid frame machines, but the failures of sidecar chassis were very noticeable.

Perhaps the most interesting feature of the sidecar outfits was the number of attachments used. Alexander's Enfield had but two fixings, yet the combination came through successfully; on the other hand, sidecars with up to six points of attachment competed, and in some cases failed to withstand the execrable surfaces encountered during the trial. This points to the fairly obvious fact that it is not wise to attempt too rigid a construction, and, though it is improbable that the old flexible sidecar will return to favour, it is more than likely that some less rigid form of coupling than is at present in use will be devised before long. A well-sprung sidecar wheel may, however, solve the problem. With regard to the success achieved by various types of engine, the following table is illuminating, and though the remarks at the beginning of these notes must be borne in mind, as some of the failures were due to bad luck, and stops close to a check, an idea may be obtained from the figures quoted.



Norton double purpose machines in the trial. Capt. A. Lindsay solo, and S. Sawer with sidecar. They secured gold and silver medals respectively.

ANALYSIS OF TYPES.

	Started.	Gold.	Silver.	Bronze.	No Award.	Retired.
SOLO						
2-stroke lightweight	6	3	–	–	–	3
1-cylinder 4-stroke, up to 350	3	–	1	–	–	2
2-cylinder 4-stroke, up to 350	2	–	–	1	1	–
2-cylinder 2-stroke	5	2	2	–	–	1
1-cylinder 4-stroke, up to 500	20	5	9	–	4	2
1-cylinder 4-stroke, up to 750	12	5	4	4	–	1

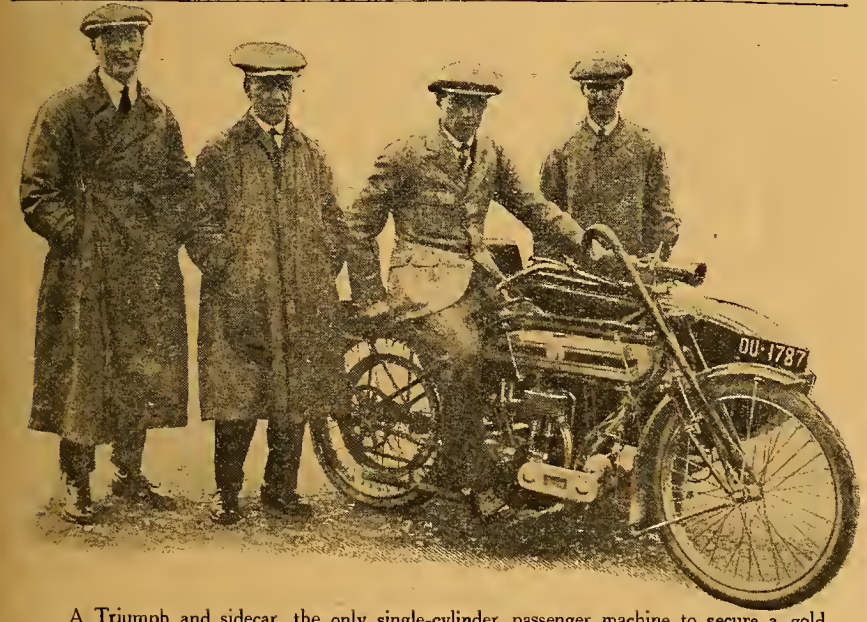
2-cylinder 4-stroke up to 1,000	24	3	7	3	2	9
4-cylinder 4-stroke over 1,000	1				–	1
RUNABOUTS.						
3-wheelers	7	1	3	1	–	2



A Triumph and sidecar, the only single-cylinder passenger machine to secure a gold medal. F. G. Edmond, the successful driver, is seen on the extreme left, with (reading left to right) G. E. Stanley, head of the Triumph Experimental Department; J. Cocker, a pre-war record-holder; and H. Green, of the testing staff.

In spite of rough roads and cross gulleys an inspection revealed but few dented rims, and wheels and spokes seem to have improved from the rough rider's point of view. There is a general tendency to increase the sizes of tyres, though tyre performances were, on the whole, disappointing. Colonial models were in evidence, a fact which is indicative of an effort to recapture some of the Overseas trade which has passed into other hands during the war.

Fittings and accessories have improved, and though a few broken mudguards and stays were noticeable at the conclusion of the trial, there was not that tendency to distribute, promiscuously, nuts, bolts, and small fittings, which has been apparent in years gone by.

Accessories.

There was rather more magneto trouble than there should have been, but perhaps this will be corrected when British manufacturers have had more time to settle down to motor cycle work, for it is an undoubted fact that better magnetos are made in this country than were obtainable before the war from foreign sources. Carburetters were the cause of but few lost marks, though one or two riders complained of the necessity of incessant tap twiddling. Many motor cyclists like an air lever to correct the mixture, but the notion of the automatic carburetter is gaining more and more favour, and it is interesting to note that a new single lever instrument is about to be marketed by one of the best known carburetter manufacturers.

With one exception, tank trouble was conspicuous by its absence, and tank fittings also showed no signs of falling off. Cable controls were thoroughly satisfactory, and though there was one instance of a wire pulling out at the nipple, and one or two of magneto controls jamming, the former may be taken as an exception, and the latter as a proof that magneto controls are seldom used.

Echoes of the Six Days Trials.—

THE WEIGHTS OF MACHINES ANALYSED.

THERE can be scarcely any doubt that the list of weights published exclusively by *The Motor Cycle* last week caused some surprise, and probably the majority of makers, too, found food for thought. There can be no denying that weights show a tendency to increase, and since design generally is not materially altering, one concludes that the small percentage of broken frames among the competing machines is due to the use of stronger and heavier material rather than any improvement in design.

For years past most makers have overcome frame breakage troubles by adding more and more metal in the lugs and stronger gauge tubing, and while this increases the safety margin, it is not good engineering. Had bridge builders followed the same lines the many magnificent engineering edifices throughout the world would not have been possible. In other words, there is a limit to increasing metal with the idea of obtaining extra strength, and, if carried far enough, a structure becomes so heavy that it will break under the load of its own weight. Adding weight to a frame necessitates strengthening the wheels and hubs in proportion, and this can be carried on indefinitely, increased weight requiring larger engines, heavier transmissions, etc.

Ten years ago the average 3½ h.p. machine weighed under 180 lb. The development of the type and adding three-speed gears and other refinements, have brought about an increase in weight of fully 50%.

Machines Under 200 lb.

Very few machines, even in the smallest lightweight class, weighed less than 200 lb., the lightest machine in the trial being the 2¼ Radco 170 lb.; with Pike's Levis second, 176 lb.; Davies's Velocette third, 180 lb.; Goodman's machine of the same make being 196 lb. The 2½ Connaught, ridden by Ashby, was 210 lb., and the 2¼ James 220 lb.

If ever scooter designers required an argument in favour of their miniatures the list of weights of competing machines in the Six Days Trial provided it. While nothing lighter than 170 lb. is available, there will always be an opening for designers of machines considerably lighter, and, at present, only the scooter and the auxiliary attachment represent the genuine lightweight, which for several years we have been urging manufacturers to consider.

Classification by Weight.

When one considers that the 211 c.c. two-stroke of 1919 weighs as much as the 3½ h.p. single gear machine of 1910 one is almost justified in concluding that reliability trials have done little to encourage designers to produce lighter machines. In every trial machines have been classified according to the size of their engines, and in the case of a lightweight it would appear that classification by weight is more desirable if development of design is the main object; but, unfortunately, the opposite view is generally taken and classification used merely for purposes of handicapping. Of course, it could not be expected that a 200 c.c. machine could equal the performance of one fitted with a 400 c.c. engine; but the main object of a small engine is economy in the points of initial cost, petrol consumption, and weight. Present prices and results show that there is very little difference on the first two counts between machines fitted with engines of the two sizes mentioned, while on the point of weight a good example is shown in the weights of competing machines in the Six Days Trials. Stordy's A.J.S. 2¾ machine, with a 350 c.c engine, weighed 220 lb., the same as the 250 c.c. two-stroke James.

From the above it may be deduced that classification by weight instead of by engine capacity should be considered by the A.C.U. Competitions Committee when they are framing the regulations for the next big trial.

Medium-powered Solo Machines.

Probably the greatest surprise in connection with weights was that provided by the A.B.C. machines. When the Sopwith Aviation Co. announced the new model at a luncheon in December it was estimated that the machine would weigh 150 lb. Emerson's machine in the Six Days Trial weighed 300 lb., and the sister mount 280 lb. It was expected that the unconventional A.B.C. would weigh less than this, although it is difficult to say exactly where weight can be reduced to any great degree. The machines were fitted with dynamo lighting sets, which probably accounts for 20 lb. It will be noted that there is 20 lb. difference in the weights of the two machines, which may be accounted for by the fact that one was an experimental machine and the other a production model, but in this respect there are very marked differences in the weights of other makes where sister machines were entered. The Sunbeam 3½ machines varied from 290 to 314 lb., the P. and M.'s from 268 to 318, the 1919 Scotts from 280 to 294 lb., a 1914 model ridden by Jesse Baker being 276 lb. Triumphs varied from 256 to 284 lb., 5 Zeniths from 284 to 324 lb., and 3½ Rovers from 298 to 332 lb.

The Sidecar Classes.

Sidecar machines on the whole were heavy, but perhaps not so heavy as many thought. By a little deduction one may in some cases find the approximate weight of sidecars without the machines.

The lightest sidecar outfit was the 3½ Ariel entered by F. E. Jones, which weighed 444 lb. Chambers's 3½ B.S.A. sidecar was 542, no less than 78 lb. heavier than the 4¼ machine driven by W. Edwards, from which one must assume that the sidecars differed considerably in type. Taking the average weights of the solo machines as applying also to those fitted with sidecars, it will be seen that the sidecar fitted to the Ariel weighed 144 lb., while the 3½ B.S.A. attachment by the same rule would be approximately 242 lb. There are several such interesting comparisons between solo and sidecar machines of the dual purpose type which throw light upon the weights of present-day sidecar attachments. Some of these are given on the following page:

L. Rutherford (3½ h.p. Sunbeam), of Cumberland, whose highly creditable showing secured him a gold medal

Echoes of the Six Days Trials.—

	Average solo.	S decar.	Assumed weight of sidecar alone.
3½ Ariel	301 lb.	444 lb.	143 lb.
4¼ B.S.A.	293 lb.	508 lb.	215 lb.
4 Norton	292 lb.	*472 lb.	180 lb.
7-9 Harley-Davidson	380 lb.	644 lb.	224 lb.
3½ Sunbeam	300 lb.	461 lb.	161 lb.
4 Triumph	265 lb.	507 lb.	242 lb.
6-7 Ariel	336 lb.	†512 lb.	176 lb.

* S. Sawer's Norton was fitted with a Millford cane sidecar—the only cane body in the trial.

† F. J. Watson's sidecar had the standard coach-built body.

The Twin Sidecars.

The smallest twin sidecar in the trial was the 4 Douglas driven by H. Thorpe, which weighed 544 lb., 12 lb. heavier than the French G.L. (532 lb.). The Campion, which, with its 700 c.c. engine, may be regarded as being in the same class as the G.L., weighed 580 lb., while the average weight of the A.J.S. machines was 562 lb.

In the larger class, fitted with 8 h.p. engines, the heaviest machine was the 8 Sunbeam, driven by J. G. Lowles, which weighed 676 lb., but one each of the New Imperials and Royal Enfields, the Chater-Lea, Clyno, Blackburne, and all the Matchless machines exceeded 600 lb. The 8 Dots were nearly 100 lb. lighter.

American Twins.

It may come as a surprise to learn that the four-cylinder Henderson, generally regarded as a very heavy machine, weighed but 588 lb. with a French G.L. Sidecar. The two Indian outfits weighed 626 and 580 lb.

Of the seven three-wheelers in the trial, Greaves's Precision-engined Morgan weighed the least (756 lb.) of the 1919 models, but Merrall's 1915 model weighed only 712 lb.

There were very few pre-war machines competing against their 1919 sisters, but two examples again show the tendency for weights to increase. Baker's Scott was a pre-war model, and weighed 276 lb. as compared with the average of 290 of the 1919 machines of the same make.

Between the 1915 Morgan and the average weight of the 1919 model there is a difference of about 50 lb.

WEIGHTS OF THE MACHINES IN THE TRIAL.

THE weights given below are considered accurate within 4 lb., and include fuel, oil, water, tools, and spares—but without driver and passenger.

Weighing the machines was one of the first items of the Six Days Trial. This was carried out at Llandrindod Wells Goods Station under the supervision of Mr. A. W. Torkington, the newly-elected chairman of the Auto Cycle Union.

Echoes of the Six Days Trials.—

SILENCE TESTS BY AUDIOMETER.

IT is probably true that the marks lost by many of the competitors in the silence test caused more surprise than any of the figures given in the provisional results. The published figures gave many results exactly the reverse of independent opinions, and suggest that Dr. Low's apparatus registered noises which either are not caught by the average ear or the wrong interpretation was put upon the meaning of the term "silence."

We were afforded an opportunity of discussing this point with Dr. Low, who invented the audiometer with which he measured the so-called "silence" of the competing machines. He told us that the even purr of a multi-cylinder engine appeared less irritating to the ear than the less frequent exhaust of a single, but after a time the ear becomes just as tired of this particular speed of air vibration.

Before measuring the noises emanating from motor cycles it was necessary to define what it was intended to measure. It is possible to measure *(a)* sound, meaning periodic disturbance; *(b)* noise, which is irregular oscillation of the air; or *(c)* a combination of the two, which accounts for the offensiveness of the total influence.

The Audiometer Described.

To test the amount of "defined noise" directly by the ear, without interposing any apparatus or diaphragm, appears to be a safe method, and in Dr. Low's audiometer one ear of the observer is connected to a trumpet having two taps, the amount of cut off required to produce silence being, obviously, a measure of relative silence. When the machines pass quickly this method is not entirely reliable, so another instrument, which can be made very delicate, is used.

A diaphragm is sprung tightly in a holder, having a trumpet attachment, and is balanced on one side by a coil spring and on the other by a toggle wire, the tension of which is variable, and affects a mirror on a plain knife edge. A beam of light is thrown on to this mirror, and the reflection on to a plate, film or ground glass, so that the mirror's magnified movement is recorded.

In order that high-speed "clatter" as well as low-speed air shock may be noticed the diaphragm is stretched to a high natural period, and is electrically damped by a magnet, which can be put into operation by a sound-operated relay, thus giving both measurements.

The apparatus used by Dr. Low was comparatively simple, and a record was taken on a tape machine, which, Dr. Low claimed, ensured impartiality.

Grades of Silence.

Marks were deducted according to the records obtained on several tests, and by grading the machines according to these lost marks some very interesting groups are obtained. In some of these groups machines which are not known for their quiet running figure alongside others generally regarded as among the "most silent" mounts.

TWO MARKS.—E. F. Goodman (2¼ Velocette) and Kaye Don (5 Zenith).

THREE MARKS.—B. A. Hill (3¾ Scott).

FOUR MARKS.—W. Drake (3½ P. and M.), H. O. Wood (3¾ Scott), G. Brown (5 Zenith), O. Wade (6 A.J.S.), F. W. Giles (6 A.J.S.), and S. Hall (10 Morgan).

FIVE MARKS.—J. F. Lidstone (2¼ James), J. Emerson (3 A.B.C.), T. B. C. Vale (3½ Ariel), J. Watson Bourne (4 Blackburne), G. A. Strange (3½ James), J. A. Newman (3½ Sunbeam), T. Rutherford (3½ Sunbeam), V. E. Horsman (4 Norton), W. L. Guy (3¾ Scott), C. P. Wood (3¾ Scott), H. Pattinson (4 Triumph), R. Charlesworth (5 Zenith), J. W. Wills (6-7 Ariel), F. Thorp (5 G.L.), G. E. Stobart (5-6 James), J. A. Hoult (8 Matchless), H. F. S. Morgan (8 Morgan), D. Alexander (8 Enfield), H. Greaves (10 Morgan), and G. D. Hardee (8 Matchless).

SIX MARKS.—P. J. Enticknapp (4 Blackburn), R. Lewis (3½ P. and M.), W. Danskin (3½ Rover), M. Isaac (3½ Rover), M. Davies (3½ Sunbeam), G. Dance (3½ Sunbeam), J. Dudley (3½ Sunbeam), T. C. De la Hay (3½ Sunbeam), J. T. Shillito (3½ Sunbeam), L. L. Sealey (4 Triumph), A. E. Wood (4¼ B.S.A.), F. F. Jones (3½ Ariel), C. Collins (6 A.J.S. sc.), S. Sawer (4 Norton sc.), F. J. Watson (6-7 Ariel sc.), H. Gibson (8 Clyno sc.), W. A. Fell-Smith (7-9 Harley-Davidson), C. R. Collier (8 Matchless), G. C. McGlashan (8 Matchless), J. Dosher (8 Royal Enfield), and P. W. Moffatt (3½ Douglas).

SEVEN MARKS: P. Pike (2¼ Levis), F. G. Ball (2¾ Douglas), T. Peck (3½ Ariel), C. W. Smith (3½ Ariel), G. Featherstonhaugh (3½ Rover), E. W. Choldcroft (4 A.J.S.), F. W. Applebee (4¼ B.S.A.), H. F. Edwards (4¼ B.S.A.), F. Turvey (4¼ B.S.A.), A. Lindsay (4 Norton), D. H. Noble (5 Rover), E. Cross (4 Triumph), H. C. Heath (6 A.J.S.), T. Stevens (4¼ James), F. G. Edmond (4 Triumph sc.), G. Shemans (4 Triumph sc.), J. S. Holroyd (8 Blackburne sc.), E. A. Colliver (7-9 Indian sc.), R. G. Mundy (8 Matchless sc.), F. W. James (8 Morgan), and D. C. Guise (8 Enfield).

EIGHT MARKS: W. B. Gibb (2¾ Douglas), B. Kershaw (2¼ Verns), W. R. Eadington (3½ Sunbeam), C. Cather Cooke (4 Triumph), M. Ryecroft (4 Triumph), W. J. Chambers (3½ B.S.A. sc.), H. R. Lane (4¼ B.S.A.), H. Thorpe (4 Douglas sc.), D. Prytherch (7-9 Indian sc.), and S. Parker (8 Enfield sc.).

Notes.

SUMMARY: Two marks, 2; three marks, 1; four marks, 6; five marks, 20; six marks, 21; seven marks, 21; eight marks, 10.

From the above summary it will be seen that the great majority lost five or more marks, and if we fix the present standard by those who lost five, six, and seven marks (62 out of 81), one must conclude that Goodman's Velocette and Kaye Don's Zenith were very quiet, B. A. Hill's Scott almost as good in this respect, and the machines in the four marks' group better than the average, while, on the other hand, the machines in the last group were more noisy than the average.

It will be noted that the "most silent" sidecars were the two A.J.S. machines, which were included in the four marks' group with a P. and M., a Zenith, a Scott, and a Morgan. The P. and M., on this showing, was the quietest 3½ single in the trial.

Major A. M. Low, D.S.C., A.C.G.I., with his audiometer, the apparatus with which he measured the noises of the competing motor cycles during the Six Days Trials.

VARIED ROAD CONDITIONS IN THE SIX DAYS TRIALS.

(1) L. C. Davies (2¾ h.p. Velocette) taking the hairpin bend on Bwlch-y-Groes. (2) G. E. Stobart (5-6 h.p. James sidecar). (3) H. Thorp (4 h.p. Douglas) passing through one of the many watersplashes. (4) O. Wade (6 h.p. A.J.S.) on loose shale near Plynlimmon. (5) E. W. Merrall, who made a good performance on his 1915 Morgan, approaching Stay-a-Little. The road on which the photograph was taken is a bare virgin rock track. Merrall, who has been in the Cameroons since 1911, was formerly a P. and M. rider. (6) Capt. A. Lindsay (4 h.p. Norton) crossing one of the scores of watersplashes on the way to Hirnant Pass. (7) S. W. Moffatt (3½ h.p. Douglas) and R. Lewis (3½ h.p. P. and M.) on Llangammarch Hill. (8) W. Pike (2¼ h.p. Levis) on the hairpin at the bottom of Bwlch-y-Groes.

Echoes of the Six Days Trials.—

C. W. Smith (3½ Ariel) had a clean sheet up to sixteen miles from the finish on Friday—then came magneto trouble.

Before leaving Llandrindod Wells, Newman's Sunbeam was again looking like a show model, thanks to the efforts of his wife, who spent the morning cleaning and polishing it.

Of the fifty-eight best performances in the consistent driving test, thirty-six were on solo machines.

It was amusing to see Tim Wood reverse his engine on the switch and try to drive backwards.

The Goodyear tyres on Colliver's Indian were in excellent condition at the finish. Even the knife-edge bridges between the diamond-shaped studs on the front wheel were untouched.

The switchboard in the sidecar of Haggas's New Imperial is reminiscent of a power station.

Broken control wires and leaning sidecars suggest at least two points for improvement in new models.

It was generally agreed that Edmond's performance on a single-cylinder machine with a heavy sidecar was deserving of every praise. He secured 180 marks, entitling him to a gold medal.

H. Reed (8 Dot sc.) had the misfortune to break his sidecar chassis. He gamely carried on, and, arriving very late at Llandrindod, was loudly cheered by sympathetic competitors.

Two of the competing Morgans, driven by H. Greaves and H. F. S. Morgan, had four speeds, a gear box being fitted on the shaft. The other three had the standard two-speed gear.

There is no unanimity among sidecar manufacturers on the point of the number of connections. Among the competitors' machines were sidecars fitted with two, three, four, five, and six connections. The first mentioned machine survived the trial, and obtained a gold medal, proving our oft-repeated contention that the more or less flexible sidecar is not likely to break its chassis as the entirely rigid type.

Mr. J. L. Norton was a hard working helper on the course, and for several hundred miles carried his father, who is seventy-seven, as his passenger.

Several pre-war trials exponents were in evidence at Llandrindod Wells, some of whom were maimed in the war, including W. Pratt, J. N. Longfield, and J. Cocker.

The only air-cooled Morgan to secure an award was the Precision-engined four-speed machine driven by H. Greaves.

The tail of Hall's Morgan came adrift early in the trial, but he succeeded in making a neat repair with the aid of two chain adjusters.

NOTES BY THE WAY.

F. J. Watson (6-7 Ariel sc.) had fitted a Canoelet sporting sidecar which he had rebuilt, raising the back part and increasing the comfort of the passenger, and adding a convenient tool locker at the rear. He had also arranged his tools in the side of the body.

Frank H. May, the pre-war A.J.S. rider, now a captain in the Army of Occupation, obtained leave to be present at the Six Days Trial as an observer.

It was particularly noticeable that a number of manufacturers were present, and that they appeared to take a keen interest in other people's machines. This is a good augury for the future, and we hope to see beneficial results in 1920 models.

Haggas, who withdrew his New Imperial sidecar at Machynlleth on Thursday, had driven throughout with the greatest consistency, Norman Longfield occupying the sidecar seat. Due to a broken throttle lever, the passenger had to do the trick holding the throttle wire in his hand, but such going, over a most difficult stretch of the course, was found to be too risky, and thus an entirely clean sheet was spoiled.

A stripped second-speed pinion caused the retirement of R. Creak Davis and his Chater-Lea on Thursday, seventeen miles from the start. The damage really occurred on Wednesday, but he managed to carry on for a time. His was also a perfect record until the gear box trouble occurred.

As usual, the A.J.S. machines ran most regularly throughout, until one of the team members, Eric Williams, retired with gear box trouble on Wednesday afternoon. A soft gear had worn entirely away.

A word of appreciation is due to the obliging Postmaster and Post Office officials at Llandrindod.

Featherstonhaugh (3½ Rover) hit a rock with his silencer and broke it off, consequently he had to finish with a free exhaust.

Design is a difficult subject to consider in allotting marks, but the surviving spring frame machines should certainly receive some special form of recognition in future events.

The Zenith climbed marvellously, considering that the lowest gear ratio was in the neighbourhood of 8 to 1. Mundy's Matchless sidecar, too, had higher ratios than usual, the low gear being 12 to 1.

Collier's Matchless outfit finished looking as if it had just come out of a showroom. Those who took the trouble to clean their machines before the finish probably impressed onlookers, but the judges were not likely to award extra marks for condition in such cases.

T. Stevens's 4¼ h.p. James, one of the few single-cylinder sidecars in the trial, passing Major Low's audiometer, which recorded the sounds made by the machine.

Even experts disagreed as to the best manner to climb Bwlch-y-Groes. Some charged as far as possible on the middle gear, others dropped into low at the foot, and went up steadily with a tiny throttle opening.

The gates at the level crossing in Builth were shut, and caused delay on several occasions, particularly on the last evening's run.

Enticknapp (Blackburne) fell in Swansea in trying to avoid a child. A dented mudguard, however, was the chief damage done.

Dynamo lighting outfits are on the increase.

Club News

Lincoln A.C.

The results of the Scamblesby hill-climb are now announced as follows :

CLASS 1 (FOR MACHINES UP TO 350 C.C.).—1, F. C. Cotton, Lincoln (2¾ Douglas); 2, G. M. Cooper, Lincoln (2¾ Omega-Jap).

CLASS 2 (FOR MACHINES UP TO 500 C.C.).—1, R. Holland, Boston (3½ Norton); 2, H. A. Baskcomb, Grimsby (3½ Norton).

CLASS 3 (FOR MACHINES UP TO 650 C.C.).—1, C. H. Allen, Grimsby (4 Triumph); 2, J. Plastow, Grimsby (4 Triumph).

CLASS 4 (UNLIMITED).—1. A. W. Grocock, Boston (8 Zenith); 2, A. A. Hodgson, Louth (7-9 Indian).

Manchester M.C.

The results of the recent successful hill-climb organised by the Manchester M.C. are as follow :

SOLO CLASS.

	Time, Sec.	M.P.H.	Formulæ Merit.
1. *E. Smith (4 Triumph) ...	32	56	97
2. †H. Andrews (2¾ A.J.S.) ..	34¼	53	94

* Gold medal. † Silver medal. ‡ Novice gold medal.

Essex M.C.

A members' hill-climb will be held by the Essex M.C. on Saturday, the 4th, and will include classes for 350, 500, 750, and 1,000 c.c. motor cycles, passenger machines, a ladies' class, and for cycle cars. The results will be decided on the motor cycle formula $\frac{C \times T^2}{W}$ (C cubic capacity, T time, W weight).

Cork and District M.C.C.

In the recent secret course trial organised by the Cork and District M.C.C. the following competitors lost no marks and secured gold medals :

S. R. Hosford (4 Triumph).
C. M. Ryan (8 New Imperial).
M. J. Hegarty (2¾ Douglas).
F. R. Dixon (3½ Sunbeam).
A. Jackson (4 Triumph).
F. T. Morehead (3½ P. and M.)
J. Mendelson (3½ Sunbeam)

The following also finished : A Townsend (Triumph), V. Browne (Triumph), J. Hohns (A.J.S.), J. Gibbins (B.S.A. sc.), J. Healy (B.S.A.), F. Burns (A.J.S.), Cagney (Triumph), and D. Duggan (Norton).

Future Events.

Oct. 4.—Essex M.C. Hill-climb.
Oct. 4.—Birmingham M.C.C. Captain's Day.
Oct. 4.—Edinburgh and District M.C. Trial for Amateurs for Palmer Trophy.
Oct. 5.—Stalybridge and District M.C. Reliability Trial.
Oct. 5.—Ilkeston and District M.C.C. Run to Belvoir Castle.
Oct. 5.—Glasgow M.C.C. Run to Biggar.
Oct 5.—M.C.C. Run to Biggar.
Oct. 11.—Cardiff City and District M.C.C. and L.C.C. Consistent Driving and Reliability Trial.
Oct. 11.—Wolverhampton M.C.C. Members' Reliability Trial.
Oct. 11.—Birmingham M.C.C. Social Run.
Oct. 19.—Ilkeston and District M.C.C. Run to Crick.
OCT. 25.—LIVERPOOL M.C. OPEN RELIANCE CUP TRIAL.
Oct. 25.—South Birmingham M.C.C. Trial for Sangster Cup.
Oct. 26.—Ilkeston and District M.C.C. Run to Chatsworth.
NOV. 1—SOUTH BIRMINGHAM M.C.C. OPEN TRIAL FOR PALMER CUP.
Nov. 8.—Birmingham M.C.C. Closing Run.

Stalybridge and District M.C.

The above club will hold a reliability trial on the 5th, starting from Bower Fold at 10 a.m.

Cardiff City and District M.C.

On Saturday, the 11th, a consistent driving and reliability trial will be held by the above club. The start will be from the Grand Hotel, Westgate Street, Cardiff, at 2.15 p.m. Competing members should communicate with the hon. secretary, Mr. E. C. Pascoe, 100 Llanfair Road, Cardiff.

Blackburn and District M.C.C.

The results of the hill climb held on the 20th ult. are announced as follow :

CLASS 4 (UP TO 350 C.C.).—J. Duxbury (2¾ Douglas), 1m. 36s.; S. A. Marks (2¾ Douglas), 1m. 36⅘s.

CLASS 5 (UP TO 560 C.C.).—H. Hebden (3½ Norton), 1m. 17s.; S. A. Marks (2¾ Douglas), 1m. 22⅘s.

CLASS 6 (T.T. UP TO 580 C.C.).—H. Hebden (3½ Norton), 1m. 18s.; S. A. Marks (2¾ Douglas), 1m. 23s.

CLASS 2 (LIGHT CARS UP TO 1,500 C.C.).—A. Morton (Little Midland), 2m. 55⅘s.; J. Hartley (Little Midland), 5m. 20s.

CLASS 3 (UP TO 270 C.C.).—W. Stanworth (2½ Connaught), 2m. 50s.

CLASS 7 (UP TO 750 C.C.).—H. Smethurst (3½ Norton), 1m. 10⅘s.; H. Hebden (3½ Norton), 1m. 17s.

CLASS 8 (ANY CAPACITY).—W. Lyons (7-9 Harley-Davidson), 1m. 10⅘s.; S. A. Marks (7-9 Harley-Davidson), 1m. 13⅘s.; H. Smethurst (3½ Norton), 1m. 16⅘s.

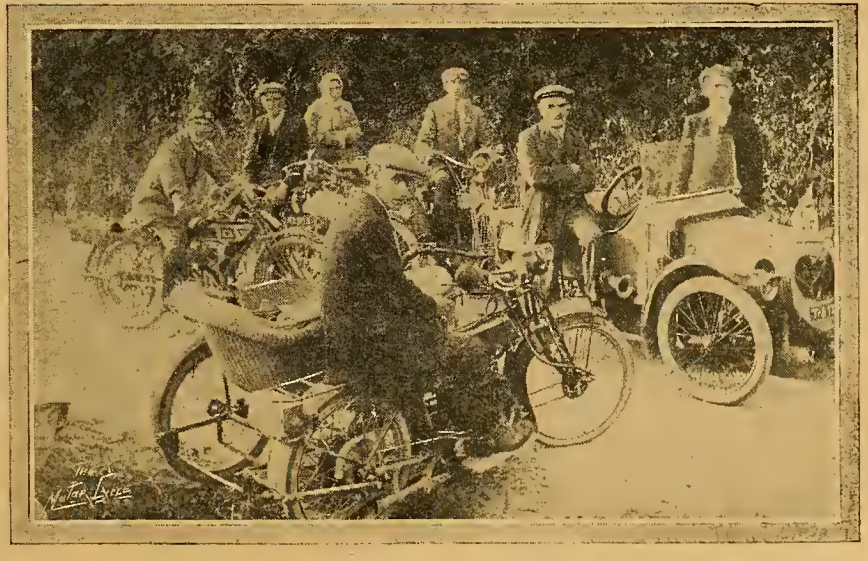
CLASS 9 (PASSENGER MACHINES UP TO 560 C.C.).—H. Hebden (3½ Norton), 2m. 15s.

CLASS 10 (SIDECAR, ANY CAPACITY).—B. Houlding (7-9 Harley-Davidson), 1m. 26s.; J. Holden (7-9 Harley-Davidson), 1m. 44⅘s.

The fastest time was made by W Lyons (7-9 Harley-Davidson), the fastest single being Smethurst's 3½ Norton, which was only ⅘s. slower.

Lancashire, Yorkshire, and Cheshire Clubs.

Mr. Eltoft, hon. secretary of the Manchester M.C., is desirous that all secretaries of Lancashire, Yorkshire, and Cheshire clubs should communicate with him as he has information to impart to them in connection with the A.C.U. meeting early in 1920.



THE ONLY MOTOR CYCLE CLUB IN CORNWALL.
Members of the Dunheved and District M.C.C. of Launceston. The machines shown are : James, Bradbury, Triumph, and a Morgan.

Police Trap.

We are informed that a police trap is working on the Duffield Road, Derby.

Next Year.

The first important French speed trial of 1920 will be the Circuit de Fontainebleau.

Average Second-hand Prices.

The second-hand market is at the moment a reflex of general trade conditions. In compiling the present list it was very noticeable that those makes in most demand remained at a steady figure or showed a slight upward tendency, while those whose scarcity had diminished, either by increased effort on the manufacturers' part or by the slightly greater freedom of import, show a decided drop in price.

Again, the models of the last few seasons have been grouped, since they mostly show neither dissimilarity of specification nor price.

A.J.S. (1914) 6 h.p., sidecar	£100
,, 1916 and later	£152
Ariel, 6-7 h.p., sidecar	£145
Allon, 2-stroke, 2-speed	£60
Bradbury, 4 h.p., single-speed, solo	£45
,, 6 h.p., sidecar	£98
B.S.A., 4½ h.p., 3-speed, sidecar	£107
Calthorpe-J.A.P., 2¾ h.p., 2-speed	£44
Clyno, 2-stroke, 2-speed	£43
,, 5-6 h.p., 3-speed, sidecar	£117
Douglas, 2¾ h.p., W.D.	£60
,, 4 h.p., 3-speed, sidecar	£120
Enfield, 2¼ h.p., 2-stroke	£57
,, (1918) 3 h.p., twin, 2-speed	£70
,, 6 h.p., sidecar	£140

,, 4 h.p., 3-speed countershaft sidecar	£138
,, 2¼ h.p., 2-stroke	£55
Zenith, 6 h.p., solo	£102
,, 6 h.p. (countershaft), and sidecar	£122

An Amended Award.

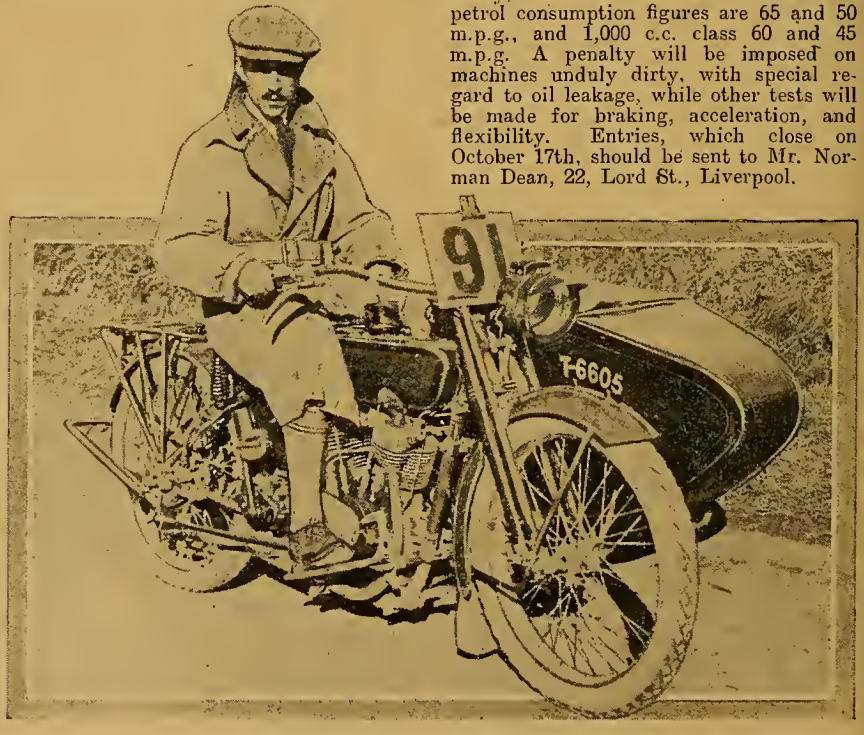
Jesse Baker (3¾ h.p. Scott), who was reported as having retired on the last day, has been allowed by the A.C.U. Committee to be recorded as having completed the trial.

Home Produced Fuel.

The interesting film entitled "Coal: Its Waste and Possibilities," prepared by the Automobile Association in conjunction with Messrs. Gaumont, in order to show how vast quantities of home-produced motor fuel—benzole—can be extracted from coal, is now being exhibited throughout the country.

A Single Gear Test.

One of the most acutely argued points among experienced riders during the Six Days Trials was whether the development of the sidecar machine has tended to provide flexible engines. We suggest a single gear trial, to be held next year, regarding which we shall have more to say next week.



THE SIX DAYS TRIAL.

One of the most consistent performances by "big twin" sidecars was put up by W. D. Fell-Smith on a Harley-Davidson. His total error in the consistent driving test was 6 sec., the least among sidecars in the 1,000 c.c. class. He secured 182 marks, and was awarded a gold medal.

Special Features.

ECHOES OF THE SIX DAYS TRIALS.
SOUTH AFRICAN T.T. CLUB TRIALS.

Special Road Warning.

The Automobile Association is informed of complaints by the residents of Henley-on-Thames concerning the high speed of motor vehicles through the borough, in which there are several narrow streets. Unless vehicles are driven at a reasonable speed, application for a speed limit Order may result.

Liverpool Open Trial.

Several features will be included in the Liverpool M.C. open trial, on the 25th October, over a Welsh course of 165 miles, including Dinas Mawddwy. Five marks will be deducted for failure to pass a petrol consumption test, in which 350 c.c. solo machines will be required to do 75 m.p.g., or, with sidecar, 55 m.p.g. In the 500 c.c. class 70 and 55 m.p.g. are the figures for solo and sidecar respectively, while in the 750 c.c. class the petrol consumption figures are 65 and 50 m.p.g., and 1,000 c.c. class 60 and 45 m.p.g. A penalty will be imposed on machines unduly dirty, with special regard to oil leakage, while other tests will be made for braking, acceleration, and flexibility. Entries, which close on October 17th, should be sent to Mr. Norman Dean, 22, Lord St., Liverpool.

The Railway Strike.

As is usual when the transport problem becomes acute, the motor cycle was much in evidence immediately the railway came to a standstill.

Ariel Prices Up.

One more firm of manufacturers have been compelled to raise the prices of their machines, this is Messrs. Ariel Motors, Ltd., whose prices are now as follow: 3½ h.p. model £95, with sidecar £125; 6-7 h.p. model £110, with sidecar £140.

A.A. Benzole Test.

On Monday last the Triumph engine, which had then run approximately 2,400 miles of the A.A. Benzole Test, was dismantled under the observation of Mr. Smith, of the A.A., and ourselves at the Triumph Works for decarbonising. We may say that even we were surprised at the small amount of carbon present, and at the condition of the engine generally, regarding which we shall have more to say later. The test is now half completed.

Racing in Spain.

The recent big Spanish event—the "Compeonato de Santander" was held over a course of approximately 120 miles. The result was a clean sweep in the three solo classes for British machines:

350 c.c. CLASS.—1, Ignacio de Arana (2¾ Douglas).
500 c.c. CLASS.—1, Ignacio de Arana (2¾ Douglas).
750 c.c. CLASS.—1, Justo Somonte (4 Douglas).

Arana's machine was a well-used 1913 model. The first prize in the 350 c.c. class was a silver tea service presented by H.M. the King of Spain.

Amalgamation of Motor Cycle Clubs?

The fact that the A.C.U. has decided to grant only twenty permits to clubs to hold open competitions in 1920 has once more brought forward the suggestion that the several clubs in some districts should amalgamate and form strong organisations worthy of their cities. So far, only the Liverpool clubs have seen the great advantages of such arrangements, and, it will be recalled, they amalgamated under the title of the Liverpool M.C. at the time when all clubs were undergoing reconstruction. At the recent meeting of so many prominent clubmen at Llandrindod Wells, Mr. Alec Ross made an impassioned appeal to officials of clubs in large cities to form stronger clubs by amalgamation, and such reconstruction schemes probably will be considered in many districts. Mr. R. Vernon Brook, the well-known Midland motorist, who contributes the motor cycle notes to the *Birmingham Daily Mail*, is advocating such an amalgamation on the part of the many Birmingham clubs, and suggests "The Midland Motor Cycle Club" as a suitable title. Personally, we have always been in favour of fewer and stronger clubs, rather than a large number of weaker bodies, and we hope the officials and members of the Midland clubs will give the matter careful consideration. A meeting has been called to-morrow (Friday) at 7 p.m., at the Birmingham Chamber of Commerce, and we hope shortly to hear that similar movements have been started in other large motor cycling centres.

IMPORTANT DATES.

Paris Salon	Oct. 9th to 19th.
Athens Motor Show	Oct. 13th to Nov. 14th.
Olympia Car Show	Nov. 7th to 15th.
Olympia Motor Cycle Show,	Nov. 24th to 29th.
Brussels Show	Dec. 8th to 13th.
Paris Aero Exhibition	Dec. 19th to Jan. 4th.
New York Show	Jan. 3rd to Jan. 10th.
Birmingham British Industries Fair	Feb. 23rd to March 6th.

New Sheffield Index Mark.

The identification letters W.A. have been allotted, in respect of motor vehicle registration, to the county borough of Sheffield. Formerly, the identification letter was W.

Petrol—the Key to National Life.

Due to the railway strike, there has been an amazing amount of motor traffic on the roads, the greater amount of which is engaged upon distribution of food, newspapers, etc., while it was evident that many sidecars were being used by their owners to transport provisions and stranded friends. It does not require a great deal of imagination to conjure up a vision of the results of such a strike had it taken place even ten years ago.

Deputation re Imported Motor Vehicles.

Last week a deputation of commercial motor manufacturers waited on Sir Auckland Geddes, at the Board of Trade, with a view to bringing before him the need for a certain measure of protection during the transitionary period while the manufacturers are engaged in producing new designs. Sir Auckland Geddes in reply announced very flatly and definitely that the Government had no intention of altering the present import duties.

The M.C.C. Annual Dinner.

The annual dinner of the Motor Cycling Club will be held on Saturday, December 6th, at the Adelaide Gallery, Charing Cross, London, W.C.2. Ladies are cordially invited. As this is the M.C.C. Victory dinner, and the presentation of prizes will take place on that occasion, there is little doubt that the event will be well supported by both members and their friends.

Petrol Economy.

Last week-end the Government made an urgent appeal to all users of petrol to limit consumption to the lowest possible amount, and once more motorists were told that "every gallon of petrol used needlessly means less food for the people."

The commandeering of petrol at the depôts last week-end, at first caused some consternation among motor cyclists who had arranged week-ends awheel, but it is questionable whether such trips would have been undertaken when the seriousness of the strike was appreciated.

The Scott Trial: Our Representative's Strenuous Day.

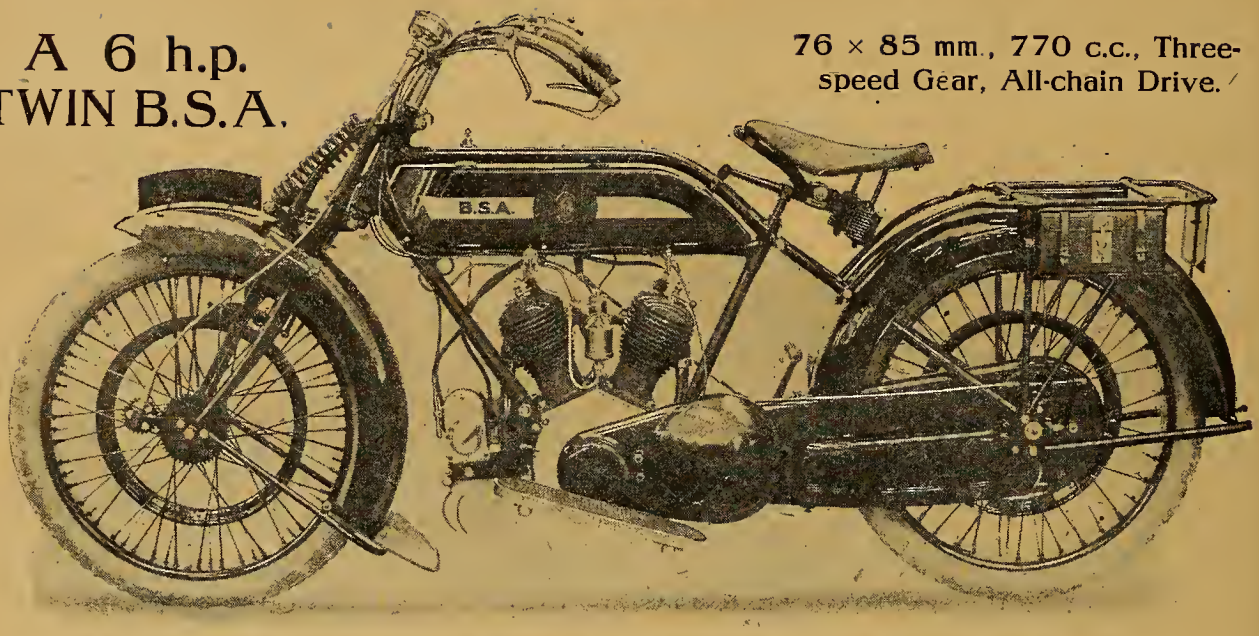
The disorganisation of transport caused some anxiety to the pressmen who were reporting the Scott Sporting Trial. Our representative intended returning partly by rail and partly by road. At the last moment he was compelled to make hurried preparations to return to Coventry by road, despite having covered almost a hundred miles in observing various hills and obstacles in the trial. Loading his Scott with suit case, petrol can, carbide, and a heavy photographic outfit, he rode throughout the night, journeying from Burnsall in Wharfedale to Coventry betwixt sunset and sunrise.

In spite of repeated carburetter troubles the rider was up to time with "copy and illustrations."

Where the competitors had to cross the River Nidd in the Scott trial last week-end a large crowd assembled, despite the inaccessibility of the place. A Triumph rider has just passed over.

A 6 h.p. TWIN B.S.A.

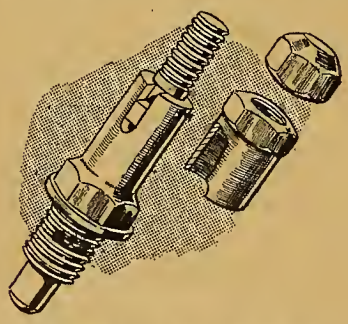
76 × 85 mm., 770 c.c., Three-speed Gear, All-chain Drive.



Transmission side of the new twin B.S.A., illustrating the wide guards, neat chain cases, and general clean appearance.

THE products of the Birmingham Small Arms Co. have always been well known for their strength and sound manufacture, so that it is not surprising to find these characteristics displayed in a marked degree in their new twin-cylinder motor cycle.

Hitherto the firm have confined their efforts to single-cylinders, which have gained a world-wide reputation, and their successes culminated in the capturing of the A.C.U. Six Days Trial team prize. The twin-cylinder is, therefore, a departure from all previous models, though, as various features have been tried out



The adjustable tappets are so designed that they exclude grit and are particularly simple to manipulate.

for a period of nearly three years, it cannot be looked upon as an experimental or untested machine.

A cursory examination gives one the idea that the design was carried out by experienced riders, and this impression was distinctly strengthened by close inspection of detail work.

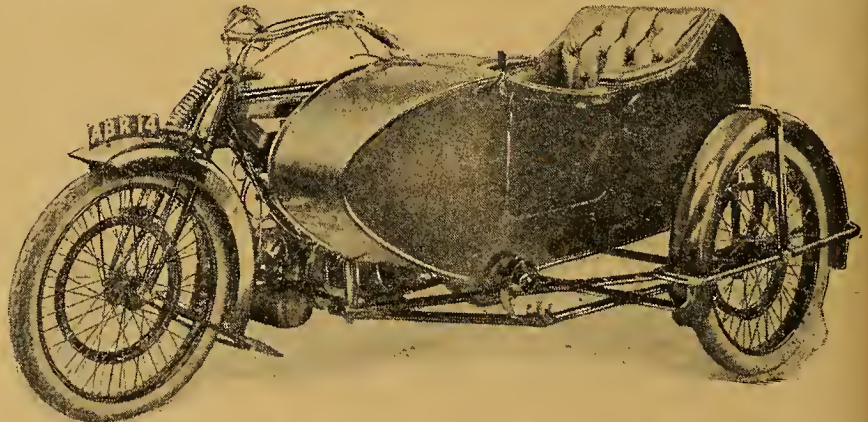
Engine Details.

Externally the engine displays no very novel features, except that it is more than usually clean in appearance, being devoid of excrescences and dust-retaining crannies. The cylinders, which are set at 50°, are distinctly reminiscent of B.S.A. single-cylinder engines. Integral heads and cylinder barrels are used, and the radiating fins are of sensible proportions. This point deserves special mention, as of late years there has been an entirely mistaken tendency towards very thin ribs, with roots too light in section to carry away the heat from the walls. All valves are interchangeable, and the ports are extremely well designed. Valve operation for both cylinders is by means of rockers actuated by a single inlet and exhaust cam, the intervening tappets being well worth a short description. Each tappet has lugs or ears, which engage with corresponding slots in the hardened steel guide. This prevents the spindle from revolving, and consequently eliminates the use of a third spanner for adjusting purposes. The lower or lock-nut for the tappet head has a skirt sliding over the outside of the tappet guide, which effectually protects the slotted portion from dust and grit. The tappet head, which is concentric with the valve stem, is reduced in weight as much as possible.

Mechanical Lubrication.

Inside the timing case is a second two to one wheel, which serves the double purpose of forming the primary drive for the magneto and rotating a pair of worm gears, whose duty is to drive the mechanical oil pump.

This pump is of the oscillating plunger type, and has the advantage of eliminating all spring loaded valves. Oil is sucked from the tank through an adjustable sight feed lubricator, and is thus pumped to a distributer placed between the cylinders. The purpose of this distributer is to divert a certain proportion of the lubricant on its way to the crank case, and to direct it into a well surrounding the base of the front cylinder, into which the skirt of the piston dips; in addition, the baffle plates are only



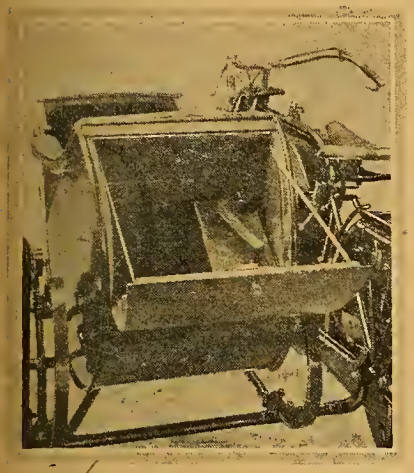
The sidecar is exceptionally large, and is of substantial construction, embodying four-point attachment.

A 6 h.p. Twin B.S.A.—

present in the case of the rear cylinder, and, consequently, even lubrication is assured. A normal hand pump is fitted for emergencies.

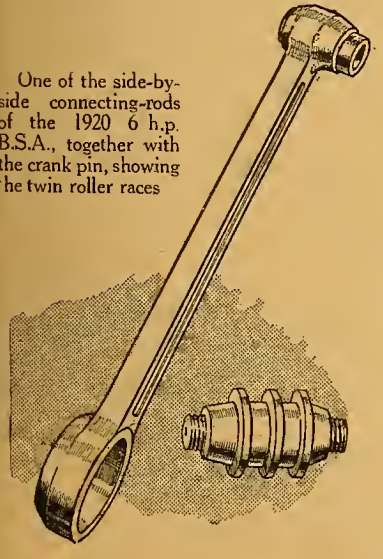
Chain drive is employed for the magneto, or a Magdyno may be fitted if desired. The long pistons carry two narrow rings at the top and two oil grooves at the bottom, a spring ring fixing being employed to secure the hollow gudgeon pin.

Phosphor bronze small end bearings are fitted to the H section connecting rods, the latter being slightly off-set to permit the use of side-by-side roller bearing big ends. Large diameter flywheels impart a steady turning motion to the ball bearing crankshaft, and felt retaining washers prevent the escape of oil from the mainshaft bearings.

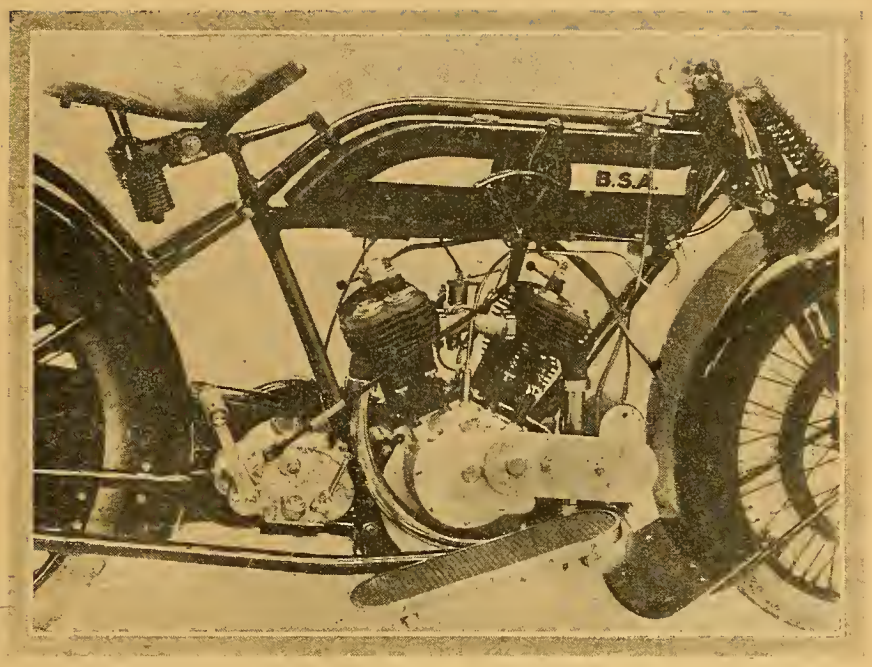


A capacious rear locker is a feature of the new B.S.A. sidecar.

In order to ensure accurate machining, there are no blind holes in the timing cover, the exposed spindle ends being covered by special caps. One other feature of the engine, the inlet pipe, deserves special mention. It is cast with a view to eliminating all sharp corners.



One of the side-by-side connecting-rods of the 1920 6 h.p. B.S.A., together with the crank pin, showing the twin roller races



The timing side of the B.S.A., showing the new and accessible gear box and the spring seat-pillar.

One flange is secured to the inlet port by a screwed ring and a similar fixing is utilised for the second flange, but, before this is screwed home, all chance of air leakage is avoided by the use of a special sleeve screwed into the inlet port which can be adjusted outwards to meet the flange.

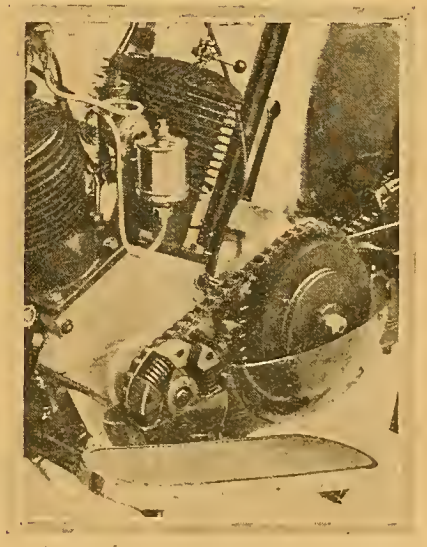
New Type of Clutch.

Transmission is by $\frac{5}{8}$in. × $\frac{3}{8}$in. chain throughout, the B.S.A. cush drive being incorporated with the engine sprocket, and an internal expanding brake with the rear driven sprocket.

A seven-plate Ferodo-faced clutch transmits power to the gear box, which has been redesigned in detail. The kick-starter mechanism is now entirely enclosed, a spring tooth ensures easy engagement, and the pedal is returned by an enclosed clock spring. The gear striking mechanism is also enclosed and embodies a simple quadrant, locked by a spring plunger which positively ensures correct gear mesh at all times. Another refinement is the fitting of an oil filler hole at such a level as to prevent overfilling of the gear box. It should be added that all gears are constantly in mesh, the change of ratio being effected by dog clutches.

One of the neatest features of the machine is the system employed for obtaining detachable and interchangeable wheels. Taking the rear wheel as the most interesting example, the combined sprocket and brake drum is mounted on the chain adjusting mechanism, and rotates on a roller bearing entirely separate from the wheel hub. The drive is transmitted through serrations on the drum, which engage with internal serrations in the hub, a distance washer taking up the lateral motion necessary for detaching the wheel when the spindle is withdrawn. A small point indicative of careful design is instanced by the construction of the chain adjusters, which are of exceptional strength and spigoted into the forked lug in such a manner that it is impossible for them to drop out. All wheels are shod with 28in. × 3in. Dunlop extra heavy tyres, or Palmer light car tyres, in each case fitted to flat base rims.

Both cycle and sidecar wheels are interchangeable, and for this reason a dummy rim, to suit the inverted front brake, is fitted in each case.

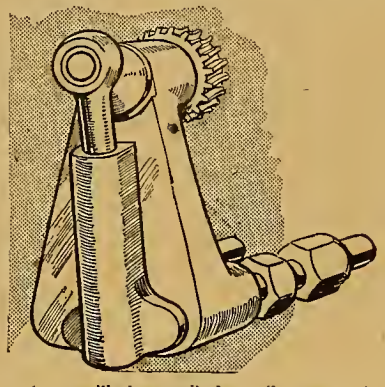


There is no unanimity among designers regarding the position of the shock absorber. Those responsible for the new B.S.A. favour the engine-shaft.

A 6 h.p. Twin B.S.A.—

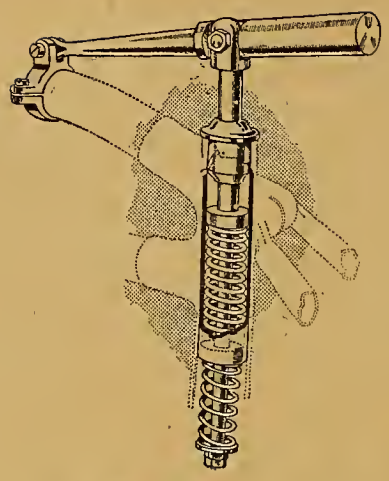
Every care has been taken to render the machine weatherproof, and 8¼in. flat guards are used both in front and rear. These guards have special valances, rolled over internally to provide channels to conduct liquid mud to the lowest point of the guard, and a special front mud shield forms an additional protection for the engine and rider.

Cast aluminium cases, made in four parts entirely enclose both driving chains, and, in spite of the fact that they are very readily detachable, special facilities for lubrication and drainage are provided.



An oscillating cylinder oil pump is employed to circulate the lubricant, and is enclosed in the timing gear cover.

The two outstanding features of frame construction are the new spring forks, in which the rebound spring has given way to a considerably longer and more flexible compression spring, and a very neat and simple spring saddle pillar. This latter consists of a beam hinged at the front end to the top tank tube, and carrying the saddle at the rear. The centre of the beam is supported by a coil spring, in compression with, in addition, a rebound spring. The whole of the spring mechanism is enclosed and protected by the saddle tube, though it is easily removable for inspection or lubrication.

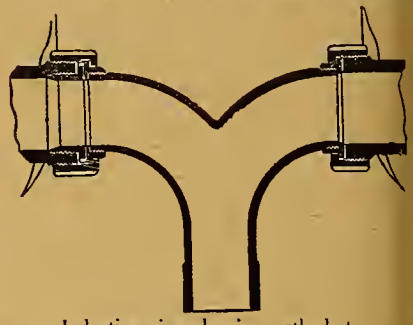


Spring seat-pillar on the new twin-cylinder B.S.A. It will be noticed that the springs are completely enclosed in the saddle tube of the frame.

The tank holds over two gallons of fuel and three pints of oil. Sidecar lugs are, of course, incorporated with the frame. With regard to fittings and finish, it is only necessary to remark that these are well up to the B.S.A. standard of excellence.

Amongst the various items which give proof of careful and practical design, the large aluminium silencer may be mentioned. This is so arranged that the gases from the cylinders enter at one corner of a rectangular receptacle, and are led round a baffle plate, finally leaving the chamber by means of a long tail pipe attached to the same side as the entry pipes. A large inspection plate on the end opposite to the pipe bosses enables the chamber to be inspected or cleaned, but it should be emphasised that there are no narrow slots or holes to become choked by oily exhaust gases.

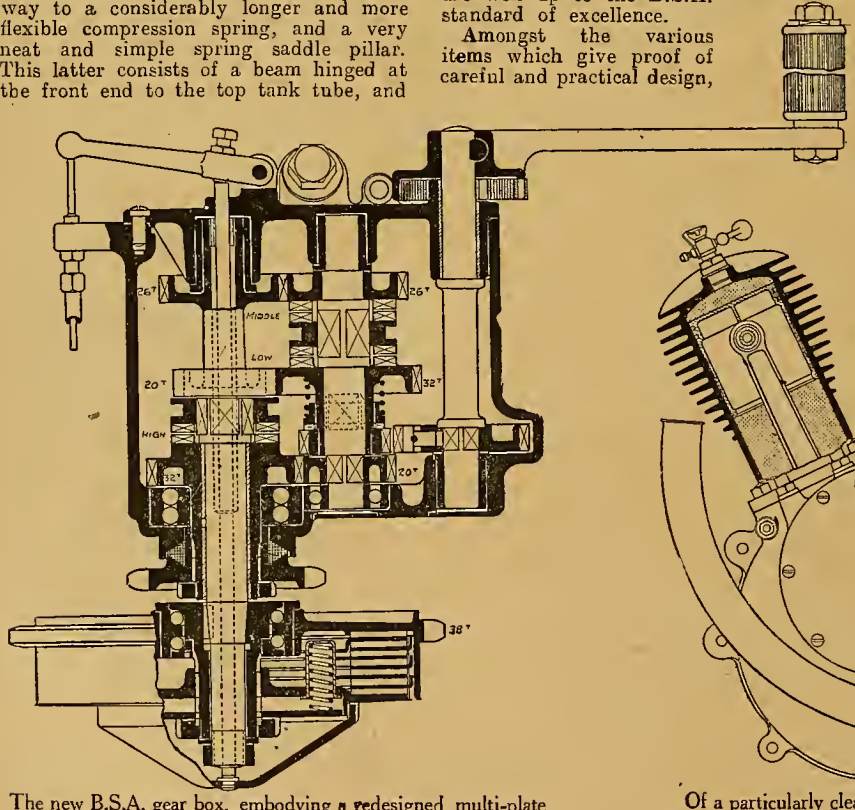
All the exhaust valve lifting mechanism is enclosed in the timing gear case, the cable attachment projecting from the top of the cover in such a manner as to prevent oil leakage, and the timing cover plate is spigoted for the greater part of its periphery. In fact, every possible precaution has been taken to render the engine clean and oil-tight.



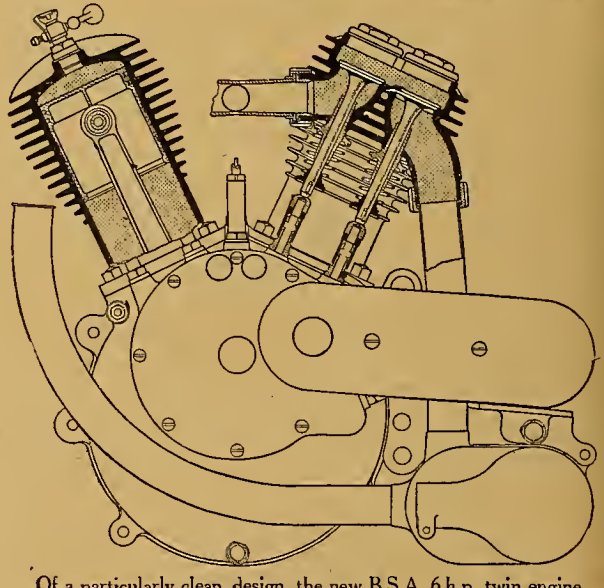
Induction pipe, showing method of obtaining air-tight joints.

A special sidecar has been constructed to suit the machine; the lines are pleasing, and the body is particularly roomy and well sprung, leaf springs being fitted in front as well as at the rear. Four points of attachment are provided.

It should be noted that, although this new model will be exhibited at Olympia, delivery will not commence before next February. A limited number of demonstration machines will, however, be in the hands of B.S.A. agents a little earlier.



The new B.S.A. gear box, embodying a redesigned multi-plate clutch. Engagement of gears is by dog clutches.



Of a particularly clean design, the new B.S.A. 6 h.p. twin engine has many features revealing road experience.

FAST SPEEDS AT STILE COP.

Well-contested Events at Wolverhampton M.C.C.'s Open Hill-climb.

FAST times were again recorded on Saturday at Stile Cop. The Wolverhampton M.C.C.'s hill-climb is usually a very sporting affair, and last Saturday's event, in spite of the fact that the number of representative makes of motor cycles was rather limited, provided some fine sport.

Before the times were announced, it was obvious that Dance's 3½ h.p. Sunbeam was the fastest machine there. In the class for solo machines, single or twins up to 600 c.c., he made the best time of the day, roaring up and literally bounding across the tape at 56½ m.p.h.

In the lightweight classes the performances on the Levis were consistently good, especially R. E. Pugh on his 2½ h.p. mount. The majority of the machines of this particular make were 2¼ h.p., and, although good times were made on these, the slightly larger bore of the former made a bigger difference than might have been expected. There was a variation of 7s. in the times of Pugh and Butterfield in Class 3, and both machines were in remarkable fettle. H. Taylor on his 2½ h.p. Diamond, in spite of physical disability, made good time. Class 4 for solo machines up to 350 c.c. afforded conclusive evidence that a two-stroke can hold its own against the four-stroke type. Entered in this class there were two particularly "hot stuff" singles in Dance's 2¾ h.p. Sunbeam and G. E. Boston's 2¾ h.p. A.J.S., and against them was pitted Kuhn's 2¾ h.p. Levis, incidentally the same bore and stroke as the Sunbeam—75 × 79 mm. Although there was a difference of 8s. between Dance's and Kuhn's time, it must be conceded that the Levis did remarkably well. Dance's 51⅘s. was actually faster than many of the 3½ h.p. machines. In fact, with the exception of De la Hay on his 3½ h.p., no other rider excelled this speed. The healthy roar of the Nortons as they came up the hill was audible evidence that the Sunbeams had formidable competitors to deal with. H. S. Noakes and C. Sgonina were the fastest on this make, the former, in Class 6a, making good time against the invincible Dance.

In Class 7 (expert and general), O. Wade, on a 2¾ h.p. A.J.S., was only 7⅖s. behind De la Hay's 3½ Sunbeam—a good performance.

The first and second places in the unlimited solo class (experts barred) were taken by Nortons, Noakes crossing the tape in 53⅖s.

G. Dance (3½ h.p. Sunbeam) making fastest time of the day in Class 6a.

O. Wade, who gave a good performance on his 2¾ h.p. A.J.S.

RESULTS ON TIME (HILL ABOUT THREE-QUARTERS OF A MILE.)

CLASS 1.—SCOOTERS.

Walk over.	O. G. Beman (Autoglider)	81⅘s.

CLASS 2A.—SOLO. 275 C.C.

1.	A. Butterfield (2¼ Levis) ..	70s.
2.	H. Newey (2¼ Levis)	127⅗s.

CLASS 2B.—EXPERTS BARRED.

1.	W. Savage (2½ Sun-Villiers) ..	74⅘s.
2.	A. Butterfield (2¼ Levis) ..	85s.

CLASS 3A.—SOLO, 300 C.C.

1.	R. E. Pugh (2½ Levis)	60⅘s.
2.	W. H. Butterfield (2¼ Levis) ..	67⅘s.

CLASS 3B.—EXPERTS BARRED.

1.	A. Butterfield (2¼ Levis)	68⅖s.
2.	W. Savage (2½ Sun-Villiers) ..	72⅖s.

CLASS 4A.

1.	G. Dance (2¾ Sunbeam)	51⅗s.
2.	G. Kuhn (2¾ Levis)	59⅗s.

CLASS 4B.—EXPERTS BARRED.

1.	G. E. Boston (2¾ A.J.S.)	58⅗s.
2	H. L. Heath (2¾ A.J.S.)	61s.

CLASS 5A.—SOLO, 500 C.C.

1.	G. Dance (3½ Sunbeam)	46⅕s.
2.	T. C. De la Hay (3½ Sunbeam)	51⅘s.
3.	H. S. Noakes (3½ Norton) ..	54⅕s.

CLASS 5B.—EXPERTS BARRED.

1.	H. S. Noakes (3½ Norton) ..	54⅘s.
2.	C. Sgonina (3½ Norton)	56s.
3.	G. E. Boston (2¾ A.J.S.)	58⅗s.

CLASS 6A.—SOLO, 600 C.C.

1.	G. Dance (3½ Sunbeam)	46s.
2.	T. C. De la Hay (3½ Sunbeam)	52⅗s.
3.	H. S. Noakes (3½ Norton)	54⅗s.

CLASS 6B.—EXPERTS BARRED.

1.	H. S. Noakes (3½ Norton)	53s.
2.	G. W. Walker (3½ Norton) ..	57⅘s.
3.	H. C. Heath (2¾ A.J.S.)	58s.

CLASS 7A.—SOLO, UNLIMITED.

1.	T. C. De la Hay (3½ Sunbeam)	49⅘s.
2.	G. Dance (2¾ Sunbeam)	55⅕s.

CLASS 7B.—EXPERTS BARRED.

1.	H. S. Noakes (3½ Norton) ..	53⅖s.
2	C. Sgonina (3½ Norton)	54⅗s.

CLASS 8.—SIDECARS, 500 C.C.

1.	G. Dance (3½ Sunbeam)	59⅗s.
2.	R. Brown (3½ Sunbeam)	72s.

CLASS 9.—SIDECAR, 600 C.C.

1.	G. Dance (3½ Sunbeam)	58⅕s.
2.	J. Dudley (4 Sunbeam)	59⅕s.

CLASS 10.—SIDECARS, UNLIMITED.

1.	G. Dance (3½ Sunbeam)	58⅘s.
2.	J. Dudley (4 Sunbeam)	59⅗s.

All three sidecar classes were won by G. Dance on a 3½ Sunbeam, and, as a grand finale to an afternoon's "deck-sweeping," he probably gave in Class 9 his best performance of the day. Whether this was adjudicated by the committee as the best performance, however, was not known at the time of writing; but to have taken a sidecar and passenger up Stile Cop, at over 44 m.p.h. on a 3½ machine, was unquestionably a fine feat—a fitting climax to the day's sport.

C9

THE SCOTT SPORTING TRIAL.

A Ceaseless Succession of Abnormal Gradients, Surface, and Watersplashes.

The Ilkley team (J. E. Walker, W. Moore, H. W. Sellers) all mounted on 3¾ h.p. Scotts, riding in close company on a typical stretch of moorland road They secured the amateur team prize.

NEVER within our long experience of North-country trials has a purely local event excited so much interest and received such ready support from all comers as the Scott sporting trial, which took place this week-end, with the Red Lion Hotel, Burnsall village, as general headquarters. We arrived at Burnsall the night before the trial, and discovered we were fortunate in having booked sleeping quarters, as not only the hotel, but every available bed in the village, were booked up by the various patrons of the event.

Meeting Mr. Dovener, secretary of the Scott Motor Cycle Co., at the hotel, we were informed that there was some possibility of a team of scooters competing, but this did not materialise. An entry of seventy-four competitors had been received by the organisers, out of which over fifty started. We were also informed by Mr. Dovener that Pathé Frères were to immortalise the titbits of the course, including Dob Park watersplash and the Scar, and, this being so, the many competitors who failed at these points at any rate have the doubtful satisfaction of knowing that their failures will afford amusement to many.

Troubles Begin.

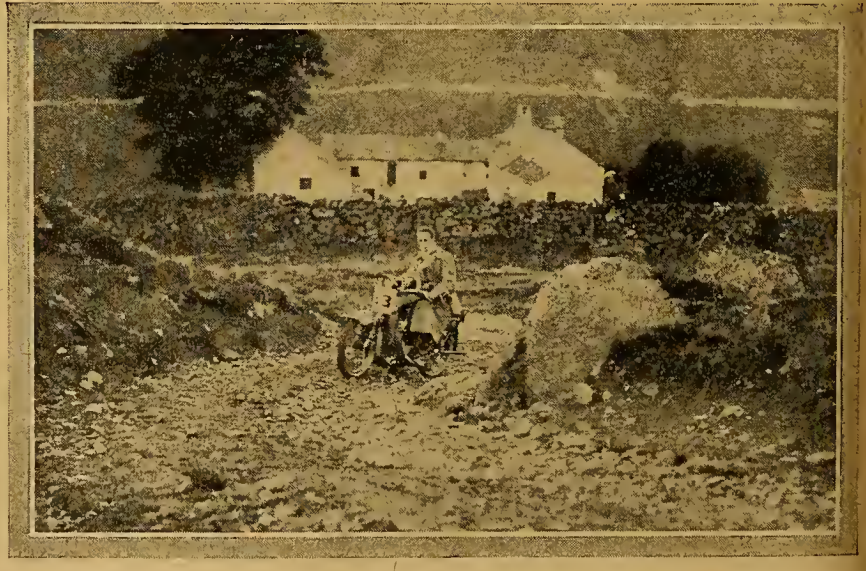
A touch of frost and a cloudless sky greeted us on the morning of the trial. Arriving at Churchtown, just outside Bradford, we found a large number of competitors already assembled, the many interesting and attractive machines drawing a surprisingly large crowd of spectators. The first man was started dead on time, and, leaving Otley, our troubles very early commenced. Approaching Dob Park all semblance of a road speedily vanished, and one of the titbits of the day—Dob Park watersplash—was immediately encountered. A huge crowd was assembled here to see the fun, and fun it assuredly was. An observer with a red flag was posted to prevent jamming, and competitor after competitor stuck in mid-stream. The water was perhaps 9in. in depth, the bed consisting of boulders, mostly about the size of a man's head, and emerging from these impossible conditions one was instantly greeted by rough cobbles on a 1 in 3 gradient. A truly appalling test hill of over a mile in length followed, and included several difficult corners, while the surface consisted of sods, sand, and stones.

Dob Park Watersplash.

The best idea as to the nature of the splash can be obtained from the fact that forty-one competitors, including many T.T. and old competition riders, failed, in so far as they lost marks either by falling off in mid-stream, jamming among the rocks, or being compelled to dismount.

The following made clean crossings and obtained full marks: C. R. Hardaker (Scott), Dosher (Enfield), Bentley Rigg (Scott), Capt. Hardy (Triumph), Mortimer Batten (P. and M.), W. E. Wasling (Coulson B), W. Townshend (P. and M.), and W. Drake (P. and M.).

Let it be clearly understood that the route presented throughout not only freak hills and watersplashes, but freak surfaces of the most difficult kind, and some miles of sheep tracks now conveyed



Jesse Baker (3¾ h.p. Scott) approaching an especially appalling surface concealed behind the bend

Hey Slack watersplash. The rider is H. Mortimer Batten (3½ h.p. P. and M.), who was one of the few who successfully negotiated the spot.

us *via* Blubberhouses to Pock Stones Moor. Another watersplash at Hey Slack followed by a stunning little rise caused many to lose marks. Here twenty competitors failed completely, while only fourteen obtained full marks.

The way over Pock Stones Moor consists of about six deep ruts overgrown with rushes, which obscure swamps and loose boulders, and many competitors fell during this difficult part of the run. Gradually the going improved, however, and arriving eventually at Burnsall we were greeted by a very excellent and welcome supply of sandwiches and hot coffee served in the bar room of the hotel.

After leaving Burnsall a competitor collided with a car, and the next man, Capt. G. Walker (4 Triumph), with the true sporting spirit infused by the Scott organisation, promptly retired in order to assist the unfortunate one.

An Alpine Route.

From Burnsall the route lay by Malham, up the steep rise across Ewe Moor to Dambrook, which was the next observed hill on the route. This hill is a grass rise about a mile in length, including two hairpins presenting the usual sheep track difficulties. Fortunately, the ground was dry, and very few failed, but arriving at Park Rash, *via* Kettlewell, any number of competitors who had clean sheets hitherto now met their Waterloo. Park Rash itself is a really terrible hill, the gradient being about 1 in 4 for 200 yards with two right-angled bends, while the surface consists of loose stones on a shifting bed of more loose stones. A possible track of about 8in. in width exists, but once bounced off this the rider has no chance whatever of making a clean ascent. Duxbury, on a Triumph, made a good and clean climb, and was the first to arrive; W. Smith (Scott) fell; "Tim" Wood collided with the wall, but restarted well; Bentley Rigg (Scott) was baulked, and had much difficulty in getting under way again; H. Hill (Scott) ran gallantly; W. Atkinson (Triumph) konked out; as also did C. Hart (P. and M.).

The following made clean ascents: J. Duxbury (Triumph), Capt. Hardy (Triumph), J. E. Walker (Scott), W. Moore (Scott), E. Wikes (Scott), Mortimer Batten (P. and M.), W. H. Clough (Scott), H. Langham (Scott), L. Gay (Scott), G. Hill (Triumph), W. Townshend (P. and M.), and J. Baker (Scott). George Wray (3½ Triumph) made his usual dramatic ascent, skidding broadside most of the way.

Miles of fly-crawls and river beds followed. The roads were the old pack roads of a departed age, long since deserted by man, or, if not, they remained as a last surviving relic of a once flourishing mining industry, for which these bleak heights were noted. Gates, stones, sheep, ruts, heather, and more stones, were the outstanding features, and branching to the right at Arkleside we experienced about nine miles of concentrated jolting and skidding, followed by what were assuredly the titbits of the day—the River Nidd and the Scar.

The latter is a freak hill, which even surpasses Park Rash in the way of the impossible. George Wray made a wonderful ascent, though he nearly committed suicide by vanishing over the precipice at one point—a most impressive performance.

Glorious weather favoured us. The event was splendidly organised owing to the unfailing energy of the Scott Motor Cycle Co., and the unstinting manner in which they ran the whole affair.

The following is a list of the competitors who started:

*A. Coupland (Scott)
J. E. Walker (Scott)
W. Moore (Scott)
H. W. Sellers (Scott)
*C. R. Hardaker (Scott)
J. Dosher (Enfield)
*E. C. Ecroyd (Triumph)
*B. Dewhirst (Triumph)
*G. Wray (Triumph)
*B. Rigg (Scott)
*C. Hart (P. and M.)
E. Wilkes (Scott)
E. Jones (Norton)
*W. Smith (Scott)
*R. W. Stanfield (Scott)
*W. H. Clough (Scott)
T. E. Oliver (Scott)
J. Duxbury (Triumph)
G. Walker (Triumph)
W. E. Haddon (A.J.S.)
D. Moore (Scott)
*Capt. Hardy (Triumph)
*W. Atkinson (Trinmph)
*G. Hill (Triumph)
H. Hill (Scott)
H. M. Batten (P. and M.)
J. Baker (Scott)
G. Dickinson (Scott)
E. S. Brittain (Triumph)
E. B. Leech (Scott)
*H. O. Wood (Scott)
*L. Guy (Scott)
*H. Langman (Scott)
W. Westwood (Triumph)
*E. Wasling (Coulson B)
*F. E. Wasling (Coulson B)
*G. A. Reed (Coulson B)
*W. E. Grange (A.J.S.)
W. Atkinson (Bat)
S. Ashby (Scott)
*T. Hargreaves (Scott)
*W. Townshend (P. and M.)
*W. Drake (P. and M.)
J. Wraith (Scott)
E. Woods (Velocette)
C. Froggatt (Scott)
—. Haggas (Scott)
*C. Wood (Scott)
Capt. Frost (Scott)
A. Grimshaw (Scott)
E. Sykes (Triumph)
C. E. Bean (Douglas)
F. W. Midwood (Omega)
J. W. Wills (James)
H. Pattison (Triumph)

* Trade rider.

RESULTS.

THE SCOTT STAFF CUP (TRADE).
(Best Solo Performance Trade Rider.)
Geoffrey Hill (4 Triumph).

THE KENNINGTON CUP.
(Best Amateur Solo.)
J. E. Walker (3¾ Scott).

THE SCOTT CHALLENGE TROPHY AND GOLD MEDALS (AMATEUR).
(For Best Team of Three Machines of Same Make.)
Ilkley M.C. (Walker, Moore, and Sellers), all on Scotts.

MYERS CUP AND GOLD MEDALS.
(Best Trade Team of Three.)
Scott team. (Wood, Guy, and Langman.)

FASTEST TIME OVER COURSE (82M.).
Geoffrey Hill (Triumph).

On the Yorkshire moors. One of the many sections of rock-strewn track encountered in the course of the run. The rider is G. Wray (4 h.p. Triumph).

Scottish Speed Championships Meeting.

EXCELLENT weather prevailed at St. Andrews, Fife, last Saturday, for the Scottish Speed Championships, and conditions generally were favourable for fast times. There was a large entry for the various events which were witnessed by a good number of spectators. As usual, the Alexanders and the Brothers Brash were well to the fore. Owing to the railway strike, photographs and a full report of the meeting were held up, but we are able to give a list of the results which are as follow:

CLASS 1.—LIGHTWEIGHT CHAMPIONSHIP.
1. D. S. Alexander (2¾ Douglas).
2. J. R. Alexander (2¾ Douglas).
3. A. E. Wills (2¾ Douglas).

CLASS 2.—MEDIUMWEIGHT CHAMPIONSHIP.
1. G. W. Glen (3½ Triumph).
2. A. Lindsay (3½ Norton).
3. O. G. Braid (3½ Norton).

CLASS 3.—HEAVYWEIGHT CHAMPIONSHIP.
1. F. W. Dixon (7 Indian).
2. D. M. Brash (7 Harley-Davidson).
3. A. T. Brash (7 Harley-Davidson).

CLASS 4.
1. A. Wills (2¾ Douglas).

CLASS 5.
1. G. W. Glen (3½ Triumph).
2. C. Duncan (3½ Norton).

CLASS 6.
1. R. Boyade (7 Bat-Jap).
2. A. B. Fairley (8 American Excelsior).

RELAY RACE.
1. Edinburgh.
2. Leven and East of Fife.
3. Glasgow.

CLASS 9.
O. B. Braid (3½ Norton).
J. A. Wood (3½ Rudge Multi).

CLASS 10.
F. W. Dixon (7 Indian).
D. M. Brash (7 Harley-Davidson).

CLASS 13.
F. W. Dixon (7 Indian sc.).
D. M. Brash (7 Harley-Davidson sc.).

The New Auto Cycle Union Chairman.

AT a committee meeting of the Auto Cycle Union held at Llandrindod Wells it was decided to elect Mr. A. W. Torkington, the hon. treasurer, chairman of the Union.

In filling this post, Mr. Torkington is well aware that a very difficult and arduous task has fallen upon him, all the more so as the late Mr. Nisbet was an ideal chairman, and his successor will have to occupy a vacancy which will be exceedingly difficult to fill.

We have known Mr. Torkington in connection with Auto Cycle Union work for the past seven years, and we know that he will do his best for the principal motor cyclists' organisation, and that the Committee would have had difficulty in finding a better man to take up the post.

During a recent interview, the new Chairman replied to our request for his views: "I want to make the Auto Cycle Union a really national institution, and that was my object in holding the general committee meetings in various parts of the country. This has, so far, proved a great success, and these provincial meetings have been heartily appreciated by local motor cyclists in the districts in which they were held."

"How long," we asked, "have you taken an active interest in motor cycle matters?"

"If you remember," replied Mr. Torkington, "I joined the Auto Cycle Union in 1912, and took up the vacant treasurership, and have since been, and am still, the Union's treasurer, though, of course, I must now vacate that post."

It was in 1912 that the Auto Cycle Union took on a new lease of life. Mr. T. W. Loughborough was appointed secretary, while Mr. Torkington took over the treasurership. At that time the A.C.U. was badly in need of reform, and these two gentlemen and other willing helpers have brought the Union to the high position it now holds.

"Naturally, the war must have kept you pretty busy?"

"Yes," replied Mr. Torkington, "the secretary, you will recollect, was a major in the Volunteers, and chief of his local special constables, and this necessitated his being away from the office for a long time, so practically the whole of the work of the A.C.U. devolved upon Mr. Otto Thomas and myself, and lately on Mr. Nisbet and myself. In addition to that, I have served three years with the Headquarters, Central Detachment of the Special Constabulary, and am still one of its members. I attended forty-six emergency calls, and was out in every air raid."

Reverting to the late chairman, we asked Mr. Torkington if the A.C.U. had any plan as to perpetuating his memory.

Mr. A. W. Torkington, chairman of the Auto Cycle Union.

"Yes," replied Mr. Torkington, "we have thought of a totally new idea. The Union has enough cups and trophies, and the last time Mr. Nisbet and I dined together he expressed his admiration of the marvellous grit and endurance displayed by motor cyclists in the arduous trials and races in which they took part, and said how valuable these attributes were in the motor cyclists who so promptly responded to their country's call, and in war, as in peace, they showed their ability to get through their task at all costs, no matter how great the danger and difficulty. We, therefore, propose to institute an award in the Senior and Junior T.T. races, which will be given to the man who finishes the race under the most untoward circumstances, and after overcoming almost insuperable difficulties. His judges are to be his fellow competitors, following the lines adopted in the Royal Navy when a man is recommended for the V.C. It is suggested that the man shall not be allowed to continue if he is suffering from severe personal injury."

Mr. Torkington has certainly started his chairmanship in the right spirit. His heart and soul are in his work for the A.C.U., and this is, of course, what matters most. He has served the Union well in the past, as he has not only been treasurer, but a member of the Finance Committee on the R.A.C. Associate Scheme, Chairman of the National Motor Cyclists' Fuel Union, which is affiliated to the Auto Cycle Union; he has represented the R.A.C. on the Advisory Committee of the National Benzole Association, and is a member of the Standing Joint Committee of the Road Transport Association, so we do not doubt for a moment that Mr. Torkington will serve the Union equally well in the future, and we wish him all success in his new position.

A Precision Motor Cycle.

FOR some time we have known that ultimately Messrs. F. E. Baker, Ltd., would produce a complete motor cycle of unique design. We have seen the machine, and can prophesy that the design will attract considerable attention. The construction, which embodies cantilever springing, is considerably in advance of present-day practice; but more we are not permitted to say at the moment.

Concurrent with the announcement that this unique machine will be placed on the market under the Precision name, comes news of more than usual interest concerning the business of F. E. Baker, Ltd. An arrangement has been made whereby a large shareholding interest in the company has been acquired by Beardmore Aero Engine, Ltd., a company allied with the famous Scottish shipbuilding and engineering company of William Beardmore and Co., Ltd. Additional capital has been provided for extensions and the adoption of a large programme of production.

The board of the company will include Sir William Beardmore, as chairman of directors, Messrs. J. C. Goodwood, C.A., and F. M. Luther, of Beardmore Aero Engine, Ltd. Mr. F. E. Baker, founder of the Precision business, continues as managing director

The Johannesburg-Durban Race.

A South African Tourist Trophy over a Difficult 421 Miles Course.

A British Lightweight Wins.

AFTER a lapse of five seasons the great event of the South African motor cyclists' year has again been held, and received enthusiastic support. The course over which the race takes place is the road (so-called) between Johannesburg and Durban, a distance of 421 miles.

Although in somewhat better condition than previously, the road in many places degenerates into a mere bush track, and several competitors suffered broken frames and similar troubles.

The start was made from City Deep Mine, Johannesburg, at 8 a.m. on the 24th ult., and the arrangements, carried out by the Rand M.C.C., were excellent; thousands of spectators witnessed the start of the forty-six competitors on their long journey.

Handicapping Equalises all Types.

The motor cycles entered were of representative makes, and of all types, and, in consequence, a careful system of handicapping had been evolved, which proved very satisfactory.

The limit man was J. P. Booth (2¼ Junior Triumph), who had 4h. 43m. start, the scratch man being P. Lawrence (7-9 Indian). Great interest and enthusiasm were manifest at various points of vantage on the route, and several exciting incidents were noted. Wolsen (3½ Hazlewood) had a bad fall near the start, but was able to continue. Dave Owen (3½ Indian) retired near Volksrust with a burst tyre, as did Carrol (4 Bradbury). Beard, riding a 4 Bradbury, broke his frame at Heidelberg.

C. H. Young (4 Triumph), when halfway, became involved in an altercation with a horse, with the result that his back forks were broken. Patching up the damage with materials obtained from some near-by iron fencing, the rider completed the course, and arrived second, averaging 36.3 m.p.h., a fine performance, under the circumstances.

Owing to the difficulty of procuring new machines, many old models were entered, one being a 1910 Bradbury, which the rider, F. Nissen, successfully piloted to the conclusion, maintaining an average of 28.9 m.p.h.

T.T. race in the Transvaal: competitors on the road near Heidelberg

British Machines Successful.

Despite the popularity gained by the products of other countries during the war, British motor cycles were predominantly successful in the event, five of the first six places being gained on them. Of the thirteen competitors who finished, ten were mounted on representative British mounts.

Percy Flook, the winner, rode a 1915 2¾ Douglas (3h. 18m. start), and completed the course of 421 miles at an average speed of 32.5 m.p.h. Flook is a well-known rider, and represented South Africa in the 1913 T.T., when he rode a Triumph. The fastest time in the race (constituting a record for the course) was made by R. Blackburn (7-9 Harley-Davidson), who averaged 36.8 m.p.h.; this speed was closely approached by C. H. Young (4 Triumph), who, with 1h. 8m. start, ran into second place, maintaining an average of 36.3 m.p.h., despite the accident and frame breakage described above.

In addition to the machines mentioned in the schedule below, the entries included many other British motor cycles, among which may be mentioned Royal Enfields, Hazlewood, Zenith, James, P. and M., Norton, and an assembled machine known as the Hilda.

C. H. Young (4 h.p. Triumph), who ran second in 11h. 17m. 20s. His average speed was 36·3 m.p.h.

Percy Flook, who won the Johannesburg-Durban handicap race on a 2¾ h.p. Douglas.

FINISHERS' TIMES AND SPEEDS IN THE JOHANNESBURG-DURBAN HANDICAP.

		Start on Handicap. h.	m.	Actual Riding Time. h.	m.	Average Speed. m.p.h
1.	P. Flook (2¾ h.p. 1915 Douglas)	3	18	12	45	32·5
2.	C. H. Young (4 h.p. 1919 Triumph)	1	8	11	25	36.3
3.	R. Blackburn (7-9 h.p. 1917 Harley-Davidson)	–	5	11	15	36.8
4.	I. H. R. Scott (3½ h.p. 1915 Rudge)	1	18	12	51	32·5
5.	J. P. Booth (2¼ h.p. 1919 Triumph)	4	43	16	30	25.1
6.	F. A. R. Zurcher (2¾ h.p. 1914 Douglas)	3	21	15	39	26.5
7.	A. Long (4 h.p. 1912 Bradbury)	1	6	13	26	30.7
8.	T. H. Nicholl (2¼ h.p. 1918 Indian)	4	13	16	54	24.6
9.	H. R. Willcocks (3½ h.p. 1915 Indian)	1	19	14	0	29.6
10.	W. A. Reckenberg (3½ h.p. 1915 B.S.A.)	1	18	14	3	29·5
11.	J. W. Price (2¾ h.p. 1915 Douglas)	3	18	16	6	25.8
12.	F. Nissen (4 h.p. 1910 Bradbury)	1	6	14	18	28.9
13.	N. Wolson (3½ h.p. 1914 Hazlewood)	1	19	14	51	28.0

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

CICETER.

Sir,—While on tour in the Cotswolds last week, I entered a shop in Cirencester. The tradesman, who has been a resident in that town for sixty years, told me that the correct pronunciation is Syrencester.

FITZWATER WRAY.

WESTON SPEED TRIALS.

Sir,—May I point out that I have no connection whatever with the motor trade, and that the overhead valve steel cylinder fitted to a B.R.S. model Norton, and illustrated in your issue of September 4th, was entirely of my own design and manufactured by myself?

I may say that the whole conversion was an experiment, and has proved entirely satisfactory. C. SGONINA.

MOTOR CYCLE SPEEDS.

Sir,—Being a regular reader of your paper, I happened to notice in your issue of May 15th a question asking the fastest speeds of a car and a motor cycle.

You state the cycle record at 93.48 m.p.h., and accomplished by S. George. I should like to state that an American Excelsior, officially timed, has obtained a speed of over 100 m.p.h., and until recently was the only machine to attain such a speed.

Also in the issue for May 8th you state that Ray Creviston attained a speed of 92½ m.p.h. This was his speed while attempting to lower Lee Hummston's road record of 94.47 m.p.h., accomplished in 1912—a year which could not boast of many fast machines. Hummston's record was also made possible by the help of an Excelsior motor cycle. I have ridden an Excelsior for the past three years, and find that it is an ideal machine for overseas work. J. C. KYLE.

New Zealand.

[The record to which we alluded is the British record made on Brooklands, and passed by the B.M.C.R.C.—ED.]

PROFITEERING.

Sir,—With reference to the steps that it is understood the manufacturers propose taking to prevent profiteering by agents of their motor cycles or light cars, it has occurred to us that a section of the public are almost as bad in this respect as the agent.

Our experience is that when customers are advised that the motor cycle or light car to their order is ready for delivery, we find in some cases the following week an advertisement in one of the public journals offering this particular machine or car for immediate delivery at either a very high premium, or inviting offers over a certain figure.

To overcome this, we would suggest that the manufacturers bind the agent to sell their productions at the makers' list price, and the agent, in his turn, bind the purchaser not to resell, under a penalty, within three months of date of purchase. We think if a plan of this kind were adopted that the real user would be able to purchase his vehicle or motor cycle at the makers' price, and would help to put a stop to the inflated prices that are at present obtained.

We recently advertised a number of military models of a certain make at the makers' list price, but soon found that these were being purchased by private people presumably for their own use, but really to resell at a greatly increased figure. To stop this, and so that the genuine user should get the benefit of the machine at the makers' price, we submitted an agreement whereby the purchaser agreed, under a penalty of £25, not to resell under three months from date of purchase without first giving us the option of purchasing back the machine at the price paid for it. This was much appreciated by the genuine user, but greatly objected to by the private profiteer.

We do not know why the manufacturer could not embody a clause of this kind in his agreement to the agent, and that the agent obtains an undertaking similar to the above from the ultimate purchaser. We should very much like to have the views of your readers on this matter, as we feel it is a question which should be thoroughly threshed out.

H. TAYLOR AND CO., LTD.,
H. TAYLOR.

STANDARDISATION OF CONTROLS.

Sir,—Having read your article on the standardisation of controls for motor cycles, particularly those of the carburetter, I think it is quite time manufacturers did something of this sort.

I do not agree, however, with one of your correspondents that throttles should open inwards, as a moment's consideration will show him that striking the handle-bars on that side would at once open up the engine.

My father last week had an accident on a Rex-Jap fitted with an Amac carburetter, through striking the throttles against a wall in turning a corner. He had an empty sidecar, and it lifted on turning to the left. On shutting off the engine (outwards) and turning to the right to bring the car down, the throttles grazed the opposite wall and opened, starting the engine, throwing him, and smashing the sidecar to pieces against another wall.

Perhaps some other of your readers have experienced the same trouble, and would also write against it.

Camborne. OUTWARDS.

COURTESY ON THE ROAD.

Sir,—I beg to draw attention to something which has almost disappeared during the war. This something is courtesy and comradeship on the roads.

Before the war one could set out assured of the fact that should he have trouble he would receive at least an offer of assistance from any passing motor cyclist.

Broken down in 1914 in the snow, as a cavalry trooper, I received assistance from a brigadier-general and a lady who were passing in a sidecar outfit. This will illustrate the extent to which pre-war comradeship of the road was carried.

Two recent experiences of mine. Coming across a soloist in trouble on a wet Sunday afternoon, I pulled up and offered assistance. Upon examination of his mount I concluded the plug was at fault. He had no spare and I lent him a new aero plug. Having no kick-starting device, he pushed his machine along, and rode off without a word. I could have followed him, of course, but my feelings can better be imagined than described. Later on, in a town, I came upon a soloist arranging himself after a spill. I called out the customary "all right?" got no answer, and came off on the tramlines. While I was getting up, the other fellow rode off. Bitten twice in one afternoon!

As one of the older school of motor cyclists I am getting disgusted. No one can afford to be selfish and ride by an unfortunate comrade with his nose in the air The machine that never breaks down has yet to be made. Upon reflection, I am not so sure that we are comrades, for we are friendless and cold enough goodness knows, almost hostile at times.

A few words on the subject from a more able writer than myself would be appreciated very much by LU 2601.

THE A.B.C. AT WESTON-SUPER-MARE.

Sir,—We have been requested by the manufacturers of the magnetos fitted to the A.B.C. motor cycle to correct an impression that was conveyed in your report on the Weston-super-Mare speed trials, contained in your issue of September 4th.

In this report, and referring to the acceleration capabilities of the A.B.C. machine, you stated, "Unfortunately, a defective magneto spoilt all chances of Emerson in this event, and practically all the running was done on one cylinder."

Subsequent tests of the two different magnetos that were tried have proved that they were perfectly satisfactory for the conditions under which they were designed, *i.e.*, all classes of touring work; but, in the conditions under which they had to perform in this speed trial, wherein a high compression ratio was used, and fairly wide plug points, the spark was found to take place across the safety gap instead of across the plug points.

With the safety gap slightly increased to suit the high compression ratio in the cylinders, the magnetos functioned perfectly at all speeds within the range of the engine.

A.B.C. MOTORS, LTD.,
GRANVILLE BRADSHAW, Engineer and Manager.

SPARE PARTS.

Sir,—Your correspondent, A. Bevan, has my sympathy. The public is constantly being lectured on the supporting of home industries, but is it not the treatment that one so often is subjected to by British firms that drives us elsewhere? True it is that minor orders are respected and attended to in a business manner by many firms, and those firms alone are worthy of our support.

I have owned for the past few years a 3½ h.p. cycle made by a firm of repute not a thousand miles from Lincoln, and whether the part required be a rocker arm, wheel rim, or petrol tap I have received it per return. Such a firm is worthy of consideration, and when its prices are taken into account there is nothing to fear in the event of the 33⅓% duty being taken off. JAS. REECE.

Sir,—I have been noticing in your paper lately letters from various people about spare parts from the makers. I have a 3½ h.p. twin Humber. I went to the makers about various things, and found them most obliging. They retuned my machine while I waited, overhauled the carburetter, and put in several new parts at an extraordinarily low price. Whenever I have written to them for spares, I have always got them by return post.

I do not think there are many makers who can beat them for promptness, and I wish them every success, and I feel sure that such treatment deserves publicity.

E. W. FLINT.

Sir,—Noticing a few letters in *The Motor Cycle* re "Spare Parts," I should like to mention my own experience. I have a 2¾ h.p. Douglas, which, owing to being driven fairly hard, requires spares pretty frequently. I always apply for these to Robinson's Garage, Cambridge, whom I consider to be exceptionally quick and businesslike in all their dealings, and to deserve the patronage of all Douglas owners requiring spares.

I might add that I have no connection whatever with Robinson's Garage, and that it is only a coincidence that my name is M. J. ROBINSON.

I have read with great interest the various letters upon the supply of spare parts, and, with no connection beyond being a satisfied owner of a machine made by the undermentioned firm, give my experiences.

Some few weeks ago, from my home in Stirlingshire, I wrote to Messrs. Butterfields, Ltd., for two small nuts for my carrier. These I was agreeably surprised to receive within three days of my order. Later I again had occasion to write for two exhaust pipe nuts, being then in remote Argyllshire. I received these in five days.

As a point of interest, I might mention that my consumption works out at 135 m.p.g. on long runs and about 110 to 115 m.p.g. on short trips, on half petrol and half benzole. The machine is a 1915 single gear Baby Levis, fixed ignition, and Amac carburetter, but lately my m.p.g. has been spoiled by the atrocious roads of Argyllshire. Climbing Rest and Be Thankful eats up the fuel!

Ardgartan, Argyllshire. LM 2904.

Sir,—I should be very pleased if you would allow me a small space in your valuable paper to say that there are still a few firms who will do repairs quickly.

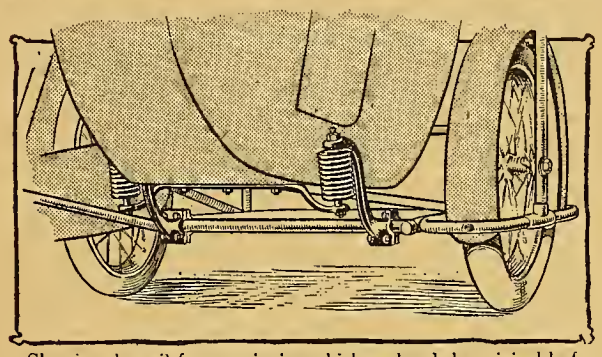
A few days ago I was unfortunate enough to stop a motor car with my little Radco, and, of course, I came off worst.

I took the machine to the makers, Messrs. Radnall, of Birmingham, on a Monday, and by the following Thursday the machine was ready for the road, and the price they charged was exceedingly moderate.

I may say I have no connection with the above firm, except that of a highly satisfied customer. L. VERNON.

SIDECAR SPRINGING.

Sir,—The accompanying photograph shows an improvement I have made to my Matchless sidecar, which not only allows more weight to be carried, but gives a beautiful soft springing movement which I have not experienced on any other sidecar. I had the arm which holds the coil springs made out of steel and exactly the same size as the two leaves in the original leaf spring. The coil springs used are the same as on the rear of the sidecar. The bar which is secured



Showing the coil front springing which replaced the original leaf springs on a Matchless sidecar.

to the bottom of the sidecar is replaced by one with a drop of about 3in. to raise the sidecar to the correct height in front. There is nothing in this arrangement which can bend, therefore the sidecar is always at its correct angle. The slight side lash which one gets is not sufficient to affect the steering adversely, and to my mind it improves it. A friend of mine who is a Matchless rider is so pleased at the result that he is having his machine similarly altered. The alteration cost me 28s. I am sure there are a good number of your readers who will endorse my statement on the weakness of the front springs, and who will find this a great improvement.

Stratford, E. C.M.

THE JUNIOR TRIUMPH AS A MOUNT FOR THE MAIMED.

Sir,—I see in *The Motor Cycle* some notes on the 1919 Triumph.

I am on the wrong side of the half hundred. In 1913 I got a three-speed B.S.A. that never gave me any trouble. I was rather handicapped as, through an accident at sea, I had lost the thumb and first finger of my right hand. In 1916 on Naval duty I got my left arm smashed in two, and they had to remove the humerus. A well-known London specialist I was under told me I should never be able to use my left arm again, and was never to attempt to ride a bicycle or motor cycle again. I cannot get my arm up or behind me. I sold my B.S.A. and was laid up for some months. I then went back to my naval coast watching duty on the rough coast of South Wales, and, at last, started to ride my bicycle. I heard of a Douglas two-speed for sale and bought it, then sold it and got a 1917 three-speed Douglas, which was a lovely mount but was too heavy for me with no arms to speak of. In July last, I got, through a friend's advice, a 1919 Junior Triumph, and sold my Douglas. It is a revelation to me; it is so light and handy and so easy in traffic and takes me up most hills on top. I was so pleased with it that I determined to get a second hand 1919 model the first chance I got, which I managed to do a couple of weeks ago.

I used to hunt a great deal, but can never ride to hounds again. I now get to a great many meets of otter and stag

hounds; and, as I know the country, I see a great deal of hunting on it, over rough roads and tracks. I can pedal it away in a few yards, and it is a godsend to me, as I feared I should never be able to see hounds again.

Anyone who is a bit on the ancient side, or nervous, or has not the proper use of his arms cannot do better than try a new 1919 Junior Triumph. I have no interest whatever in the company, but just give my experience for what it is worth.

D. J. W. EDWARDES.

A CANDID CRITICISM.

Sir,—While agreeing with Major Kennedy as regards the desirability of simplifying handle-bar controls, I certainly do not think many riders will fall in with the alternatives he suggests. He says in effect—

(1.) "The air lever I have never found any use for, as the carburetter is entirely automatic"; and later, "Why not fit a hand-controlled air slide on the carburetter itself?"

If the air lever is useless, why fit it anywhere?—though I venture to think that as winter comes on Major Kennedy will find some use for this control.

(2.) "The magneto control might be fitted on the tank, as it is seldom necessary to use it?"

Evidently Major Kennedy is not a sidecarist. If so, and he had this lever on the tank, he would very soon want it back on the bars. A machine has to be laid out for all conditions, and no competition rider would be very keen on a tank magneto lever, which is apt to be required in the twinkling of an eye.

Again, even if these levers are seldom used, it seems to me that they might as well be on the bars in a properly accessible position as anywhere else.

The Triumph merely conforms to everyday practice as regards its handle-bar controls, and one really fails to see how any practical simplification could be made. One does not require to use all the controls at the same time, and, this being so, why place some of them in obscure and inaccessible places, falsely gratified with a sense of having simplified matters? I once collided with the back of a London omnibus through searching for the twiddley little air lever of a new Indian I was riding for the first time, and now prefer everything visible and above board.

I do not think Major Kennedy's petrol consumption is quite up to the average. I used to do 105 m.p.g. regularly riding solo. The new P. and M. I am now riding does 96-100 m.p.g. with a sidecar in the Highlands, which I think tops anything I have ever previously experienced.

Such candid criticisms as the one I criticise are refreshing.

CHINOOK.

311 M.P.G

Sir,—Upon first reading the letter from your correspondent Mr. Hudson, I thought I would reply in detail. I think, however, that I can explain the matter simply to him and quite briefly.

When a carburetter is flooded and a few minutes allowed to elapse whilst the machine is wheeled, the results of flooding disappear. To obtain easy starting it is of no use to flood a carburetter long before it is required. The petrol is then in a state of equilibrium, and excess which overflows the jet has dripped out and evaporated. If the level in a tube feeding the float chamber is taken and found quite stationary *before* starting the test, and the level is allowed to become stationary *after* the test, it is obvious that the conditions are the same, as the float chamber must have filled itself from the tube to the same level. The engine suction cannot suck the float chamber empty without the testing feed tube level dropping, and this level becomes quite stationary after each test.

Mr. Hudson's suggestion that a large float chamber would enable no consumption of petrol to be obtained on a half-mile run is ludicrous because the float chamber is kept at the same level before and after by the petrol running in from the tube.

Surely Mr. F. A. Hudson, A.M.I.C.E., is aware that consumption varies continually to an enormous extent, and that to obtain very low consumption over short distances where very small power is being used is not unusual in a well-designed machine.

The 40-50 h.p. Rolls-Royce car which did twenty-four odd miles per gallon, with a weight of about two tons and over hilly roads for a long distance and *not* slowly, is far more remarkable than almost anything I have experienced. The

SIX UP ON A SIDECAR.

The 8 h.p. New Imperial sidecar depicted above belongs to a Leicester enthusiast, who regularly carries his wife and four children. We are informed that the two small passengers in th "dickey" are quite comfortable

results were officially observed by the Royal Automobile Club, and possibly Mr. Hudson might like to take the matter up with them!

Your correspondent was present all through the test, actually drove me to the spot and converted the figures into m.p.g. for me later in the afternoon without a word upon the subject. He possibly finds it more interesting, for some strange reason, to wait until he reaches home, and then write to John—I mean *The Motor Cycle*, about it.

A. M. LOW (Major, R.A.F.).

THE LIGHTING REGULATIONS.

Sir,—One wonders, when reading the letter signed by your correspondent "Liberum Arbitorium," if he ever used the road at night, and, if so, one can only presume that he rides a push bicycle, and has never driven a car or motor cycle himself at night. If he has he would be only too pleased to provide the police with "one of the finest sports they ever had," or, in other words, the duty to see that every vehicle on the road between half an hour after sunset and half an hour before sunrise carried front and rear lights.

I am certainly sorry for your correspondent; he must be exceptionally unfortunate in the rear lights he has. I might say that I have ridden both motor cycles and push cycles for many years, and have never experienced any difficulty in keeping rear lights alight. I should suggest that he buy a new one by any well-known maker.

I think the large number of motorists and motor cyclists would like to see an emergency Order on the subject issued at once under D.O.R.A., and permanent legislation as soon as possible.

Cannot the A.A. and the R.A.C. take the matter up before any more serious accidents occur? Several have happened since the Order was rescinded.

EDWARD C. PRATT.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

(Issued in conjunction with *The Motor Cycle*.")

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle, its care and management. Twentieth Edition. 286 pages. 400 illustrations.	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Sixth Edition. (Second Reprint).	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	4/6	4/10

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Position of Sidecar Wheel.

How would the sidecar wheel forward of the driving wheel affect the steering of a sidecar outfit?—C.T.

If the sidecar wheel is very much in advance of the rear wheel of the motor cycle there is a great tendency for the sidecar to lift when taking left-hand corners. A slight advance, however, of the sidecar wheel, say about 4in., generally gives a better all-round steering than is experienced with an outfit in which both the sidecar and motor cycle rear wheels are level.

Care of Magneto.

I have recently purchased a Royal Enfield motor cycle fitted with Bosch magneto. Will you kindly inform me where I could obtain a copy of the makers' instructions as to oiling and as to the care of the magneto. I have applied to the Enfield Co., and they inform me that they regret they are out of stock of the booklet.—NOVICE.

A current copy of "Motor Cycles and How to Manage Them," price 2s. 10d. by post from our publishing offices, 20, Tudor Street, London, E.C.4, contains detailed descriptions of standard type mangetos. The instructions for adjustment, cleaning, etc., are very complete, and cover any type of magneto on the market.

4 h.p. Single for Passenger Work.

I have a 1917 4 h.p. Triumph, and am anxious to turn this into a sporting outfit by having discs fitted all round and buying a second-hand light torpedo sidecar. (1.) Can you tell me if it will be powerful enough to take any hill, myself 10½ st. and passenger 7 st.? (2.) If it could occasionally take three up, say another 9 st.? (3.) The make of a suitable sidecar and approximate second-hand price of same? (4.) Maximum speed obtainable? (5.) Average m.p.g.? W.S.W.

(1.) A countershaft Triumph is quite capable of taking a sidecar and passenger up most hills where the wheel can grip. (2.) It would also take three-up anywhere excepting the most hilly districts. (3.) Any first-class make of sidecar would be suitable, and if you do not require a new one, we would refer you to our advertisement columns. (4.) Under ordinary touring conditions you should obtain a speed of 45 m.p.h. with the outfit. (5.) About 60 to 65 m.p.g.

V Twin Lubrication.

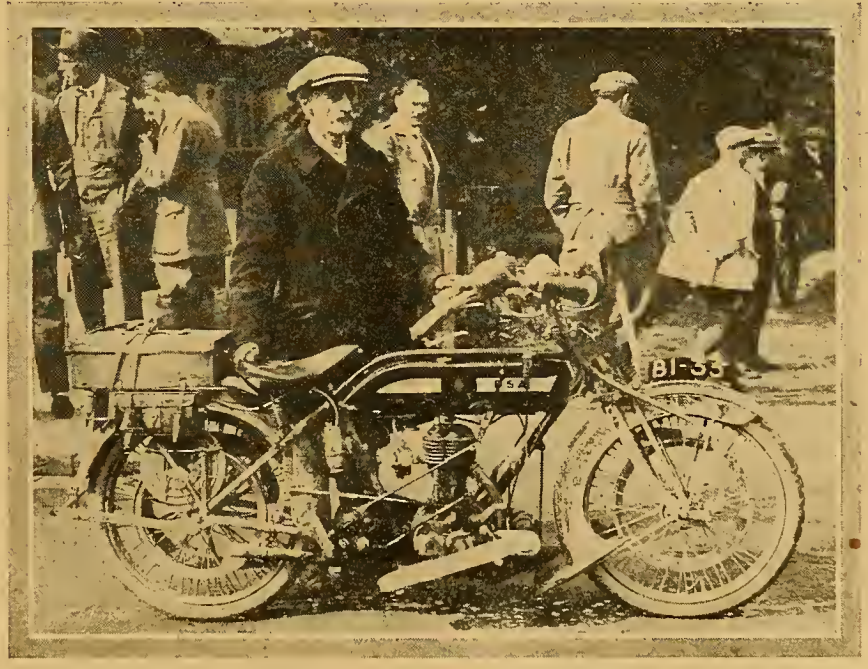
(1.) I have a 5-6 h.p. Clyno combination, about 1914, the rear cylinder of which continually oils up the plug about every ten miles or less. (2.) Also, the front cylinder fires very irregularly when running slowly. (3.) I only obtain about 35 m.p.g. with a 25 Amac jet. Is this too low? (4.) Do the gear box and chain get oiled from the engine or does one oil them separately?—C.H.T.

(1.) You are probably giving your engine too much oil, and it may be advisable to improvise some form of baffle plate at the base of the rear cylinder to prevent excess of oil being thrown therein. (2.) Irregular firing of the front cylinder may be due to the plug, as you suggest, or air leaks in induction pipe. Note particularly the inlet valve and guide, which, if much worn, will also cause poor running at low speeds. (3.) 35 m.p.g. is decidedly poor. Try slightly lowering the level, and also examine the petrol supply system generally for leaking joints. (4.) The gears and chains will require individual oiling about every 500 miles.

A Bad Bargain.

An advertisement appeared as follows: "2¾ Douglas for sale, renovated, as new; wants assembling." I went to see this machine in London, and the parts were all over the place, but I was assured that they were all there with the exception of tyres, tubes, and footrests. When it arrived I found the following parts missing. Complete head for front fork attachment, foot-brake rubber and pedal, four valve springs, no high-tension cable, one plug, no hub, or spokes for rear wheel. The tank was in a dirty condition, all rusted, and a box supposed to contain bolts and nuts was filled with tin-tacks, nails, and screws. I have written to the firm and they answer that nothing can be done. Are they liable for replacement?—F.J.H.

As the advertisement obviously misrepresented the machine you will be justified in demanding the return of your money if you can prove all your statements. We should advise you to place the matter in the hands of a local solicitor.



"No Age Limit" in the A.C.U. Six Days Trial. F. W. Applebee ("Pa"), the oldest competitor. His age is 59, and he made a fine performance on his 4¼ h.p. B.S.A., gaining a gold medal.

Dread of Punctures.

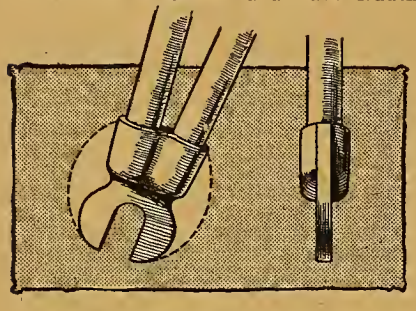
I am an old pedal cyclist, and have decided to go in for a motor cycle and sidecar, but there is one thing with the motor cycle I dread, and that is a puncture. Will you kindly say if there is a puncture-proof band? If so, where are they to be bought?—J.W.S.

Puncture-proof bands have not proved satisfactory when used in motor cycle tyres. We should recommend yon to fit heavy covers of the best quality.

READERS' REPLIES.

Damaged Fork End.

May I point out to your correspondent that I had a similar occurrence to my front fork, but I got it welded as per dotted line in sketch and have ridden



Showing position in which new metal was welded on fork-ends.

it at high speeds over rough roads, but it has never given the least signs of breaking. Perhaps this will be useful to your contribntor.—A.C.

Elusive Ignition Fault.

I had exactly the same trouble with a Bosch DA2 magneto, as your correspondent S.W.R. experienced. I cured it easily after eliminating every other source of failure, such as leaking condenser, poor earth, etc. The failnre was dne to an ovalty of about .02in. in the bearing, which is in one with the bronze end plate. This was reamered out about $\frac{1}{16}$in., the armature spindle lapped true, and then a liner pressed into the end plate. The hole was then scraped to an exact fit on spindle. The reason of the failnre is due to slight short circuiting of the armature with the pole pieces (perhaps metallic dust helps also) due to the pull of the driving chain.—WALTER HARE.

As I have recently had an exactly similar experience, I may be of some help to this reader. In my opinion, his trouble is not due to ignition at all, which is proved, as in my case, by being able to run well on each cylinder in turn. What happened was this, the exhaust valve spring when fully extended was too weak to keep the valve closed regnlarly on the induction stroke (back cylinder) when running at a comparatively slow speed, and on disconnecting the front cable connection, the engine speed would fall slightly and allow a proper mixture to be drawn into the rear cylinder without the exhaust valve lifting off its seat. New valve springs remedied the defect absolutely. It is advisable also to see that the inlet valve guides are not excessively worn, as this may cause the mixture to vary in richness.—J. B. HUDSON.

MONTHLY TOTAL OF QUERIES.

During last month "The Motor Cycle" queries department answered upwards of 700 correspondents by post.

RECOMMENDED ROUTES.

COVENTRY TO LEEDS.—B.O.
Coventry, Leicester, Melton Mowbray, Grantham, Newark, Retford, Bawtry, Doncaster, Pontefract, Leeds.

SPARKLETS

Barimar Welding in France.

A company has been formed in Paris with the title "La Société Française Barimar," in order to exploit the Barimar welding processes in France, Tunis, and Algeria. The factory is situated at 48, Rue d'Alsace, Clichy (Seine).

The Bleriot Whippet.

We are informed that the Bleriot Aircraft and Motor Car Works will in future be known as the Air Navigation and Engineering Company, Limited, Addlestone, Surrey. This firm manufactures the Bleriot-Whippet cycle car.

No Ariel Light Car.

Ariel Works, Ltd., Bournbrook, Birmingham, inform us that owing to unforeseen delays, etc., they will not be marketing a small car during the 1920 season. Their activities will be confined to the manufacture of the well-known Ariel cycles and motor cycles.

Royal Ruby Prices.

Commencing from September 1st, all Royal Ruby machines will be sold by the agents of the Ruby Cycle Co., Ltd., at the advertised price, plus cost of crate and carriage. This arrangement, which is a worthy step to check profiteering, will be in force throughout 1920.

Sidecars in Speed Events.

At the recent Luton Hoo speed trials Verus sidecars made their first appearance in competitions, being fitted to H. le Vack's Edmund-M.A.G. and Baragwanath's Zenith. Four firsts were secured by each of these riders.

A Motor Cycle from Sheffield.

We learn that G. W. Wilkin, the well-known Sheffield agent and motor cyclist, has relinquished his interest in the firm of Wilkin Motors, 154, Broomhall Street, Sheffield, and is now manufacturing a motor cycle under his own name fitted with Blackburne or Villiers engines.

"The Technical Review."

During the war a very interesting publication was issued by the War Office, known as "The Technical Supplement for the Review of the Foreign Press." Renamed "The Technical Review" (20, Tavistock Street, London, W.C.2), it will remain under its original editor, Major W. E. Simnett, M.B.E., R.E.

The Fellows Magneto.

We are in receipt of the latest catalogue of Fellows magnetos from the Fellows Magneto Co., Ltd., Cumberland Avenue, Park Royal, Willesden, London, N.W.10. This company sell three different types of motor cycle magnetos the ES1 single-cylinder type, the ES2 two-cylinder type for horizontally-opposed engines firing at 180°, and the ES11 two-cylinder pattern for V engines. All these magnetos have the same dimensions.

Motoring Reconstruction.

Big Results of the A.A.'s "Peace Push."

Immediately the Armistice was signed the Automobile Association settled down to the task of restoring touring conditions to their pre-war standard. As its five hundred civilian soldiers were demobilised they resumed their old positions and helped to train the new blood which replaced those who had fallen in the war.

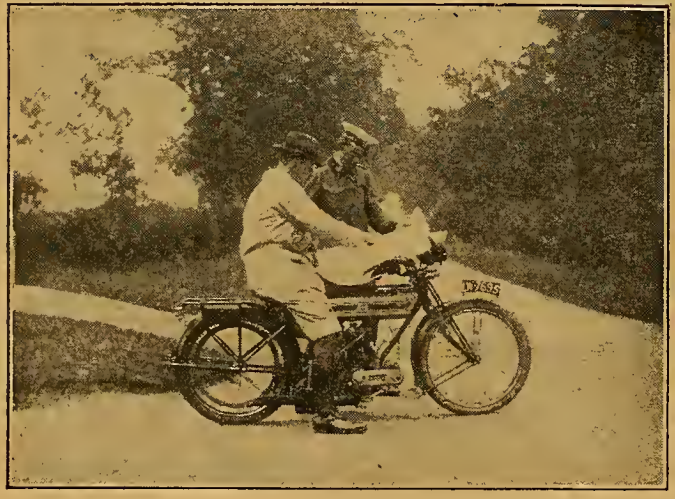
When one remembers touring conditions during 1915/18 and contrasts the position with that of to-day, the success of the A.A.'s endeavours is easily seen.

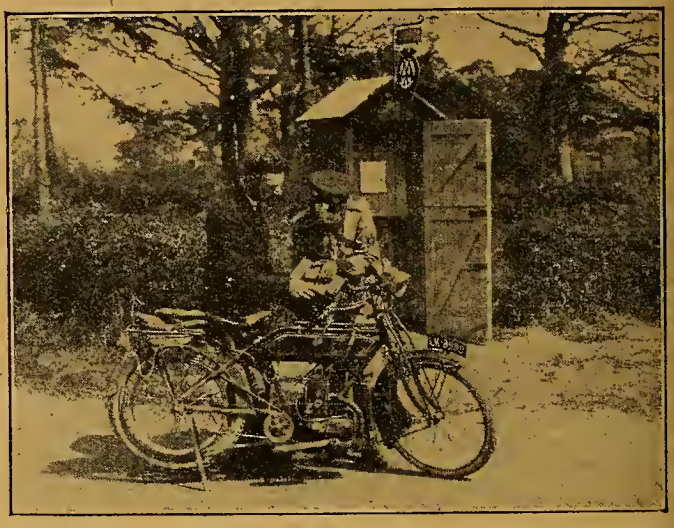
THE KHAKI-CLAD A.A. PATROLS are again on all the main roads, directing traffic, undertaking roadside adjustments, obtaining replacements, giving members road information and warning them of highway dangers. "Mechanical First-Aid" Cycles for light repairs to members' cars or motor cycles have been added to the patrol organisation.

ROADSIDE TELEPHONE BOXES have been re-opened, the number of instruments has been increased, and the service is being extended so as to be available to every member at any hour of the day or night.

AGENTS AND REPAIRERS have been appointed on twenty thousand miles of main road in the United Kingdom. In every case an official of the Association inspects the premises and facilities before an appointment is made.

A.A. HOTELS have been re-inspected by a specially trained staff. The hotels have been classified on a "star" basis and the list is constantly being added to and revised.





TOURING FACILITIES are again available and the Association provides all possible assistance to members touring with their cars, light cars or motor cycles in Great Britain and Ireland.

FOREIGN TOURING ASSISTANCE has been augmented so that members are now able to take their cars abroad without having to deposit cash in respect of customs dues.

FREE LEGAL DEFENCE is afforded to every member in any proceedings, arising out of the ownership or use of privately-owned motor vehicles, instituted under the Motor Car Act. This benefit has now been greatly extended and covers Free Legal Representation by the Association's solicitors in civil cases.

Other privileges of A.A. membership include Free Legal Advice, Special Insurance Facilities, Engineering Assistance, etc., etc.

Full particulars of all these benefits are contained in the booklet, "The Key to the Open Road," a copy of which can be obtained post free, from the Secretary, The Automobile Association, 21, Fanum House, Whitcomb Street, London, W.C.2. Send a postcard to-day. Motorists in London who wish to join the Association without delay are invited to call at Headquarters, where a staff of experts is always in attendance ready to give information on any question relating to motoring.

In answering this advertisement it is desirable to mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns First 12 words or less 2/-, and 2d. for every ıdditional word. Each paragraph is charged ıparately. Name and address must be counted. ıries discounts, conditions, and special terms ı regular trade advertisers will be quoted on ıplication.

Postal Orders and Cheques sent in payment for ivertisements should be made payable ILIFFE & SONS Ltd., and crossed & Co. reasury Notes, being untraceable if lost in ransit, should not be sent as remittances.

All advertisements in this section should be ccompanied with remittance, and be addressed the offices of "The Motor Cycle," Hertford reet, Coventry. To ensure insertion letters ıould be posted in time to reach the offices of The Motor Cycle," Coventry, or London (20, udor St., E.C.4), by the first post on Friday ıorning previous to the day of issue.

All letters relating to advertisements should uote the number which is printed at the end of ich advertisement, and the date of the issue which it appeared.

The proprietors are not responsible for clerical r printers' errors, although every care is taken avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be ddressed to numbers at "The Motor Cycle" Office. hen this is desired, the sum of 6d. to defray the cost of gistration and to cover postage on replies must be added the advertisement charge, which must include the ords Box 000, c/o "The Motor Cycle." Only the number ill appear in the advertisement. All replies should be ddressed No. 000, c/o "Motor Cycle," 20, Tudor Street, .C.4. *Replies to Box Number advertisements containing mittances should be sent by registered post, but in all such ses it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box umber, as it is unusual for these to be sold without first ing inspected by the intending purchaser, advertisers will cilitate business by embodying in their advertisements me mention of the district in which the car offered ay be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons ay deal in perfect safety by availing themselves of our eposit System. If the money be deposited with "The otor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the oods is three days, and if a sale is effected we remit the oount to the seller, but, if not, we return the amount the depositor, and each party to the transaction pays rriage one way. For all transactions up to £10, a eposit fee of 1/- is charged; on transactions over £10 d under £50, the fee is 2/6; over £50 and under £75, 5/-; er £75 and under £100, 7/6; and on all transactions er £100, ½ %. All deposit matters are dealt with at , Tudor Street, London, E.C.4, and cheques and money ders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an dication that the advertiser is willing to avail himself of e Deposit System. Other advertisers may be equally cirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no swer to their enquiries are requested to regard the dence as an indication that the goods advertised have ready been disposed of. Advertisers often receive so any enquiries that it is quite impossible to reply to ch one by post.

BOOT

REPAIRING

"Elite Holdtite Rivetless Soles."

Soles STUCK ON.—

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdtite Sol-fix solution. **We guarantee them to hold as firm as rivets or sewing.** This process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof.** Full instructions given with each pair of soles

ENFIELD Combination, 6-8h.p., 1918, good condition; £125; any time.—78, Springhank Rd., Hither Green. [7246

JONES' Garage, special agents for Enfields, Broadway, Muswell Hill, N.10, and Woodside Parade, North Finchley. [2920

ENFIELD Combination, 1918, just overhauled, splendid condition; £135.—40, Replingham Rd., Southfields, S.W. [7310

1916 Enfield 3h.p. Twin, 2-speed, lamps, and horn, good condition throughout; £60.—14, Market St., Stourbridge. [X4436

ENFIELD Combination, 1919, unused; bought car while waiting; £160.—Woodville, Anchor Wood, Bickington, Fremington. [X4303

ENFIELD 1919 8h.p. Combination, delivered last month; £164.—Stephens, Eldroth, Wake Green Rd., Moseley, Birmingham. [X4408

ROYAL ENFIELD, about 3h.p., V, kick start, 2-speed, splendid machine.—Lascell, R.A.F. Hospital, Old Sarum, Salisbury. [7054

ENFIELD 6h.p. 1916 Combination, hood, screen, luggage grid, lamps, Klaxon; £130; after 6.—191, Kingshall Rd., Beckenham. [7455

3h.p. Enfield, new June, 1919, little ridden, with or without light and good sidecar; offers.—Samuel Pence, Whittimere St., Walsall. [X4630

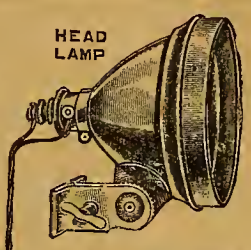
ENFIELD 1919 2¼h.p., 2-speed, lamps, etc., as new; purchasing sidecar machine; seen any time; £55.—Adams, H.M.S. P.64, Portland. [6705

6h.p. Enfield Combination, 1915, perfect condition, lamps, speedometer, nearly new tyres; £130.—75, Battle Rd., Belvedere, Kent. [6836

ENFIELD 6-8h.p. Combination, hood, screen, lamps, Dunlops, like a little car; first cheque secures; £98.—135, Plashet Rd., Upton Park. [6858

1918 Enfield 2-stroke, 2-speed, chain drive, Lucas horn, tools, little used, perfect condition; 48 gns.—881, Finchley Rd., Golders Green. [6883

ENFIELD 3h.p., 1916, excellent condition, little used; £60; horn, lamps, new Dunlop, spare chain.—Lee, 23, Oldfield Rd., Sale, Cheshire. [X4646



"VOLEX"

Dry Battery LIGHTING OUTFITS.

BRITISH MADE.

Volex Lighting Sets are the ideal, no-trouble outfits for the Motor Cycle and Sidecar.
For over ten years they have been in use for this service, and of recent years, in consequence of their dependency, the demand is constantly increasing.
Dynamo Lighting Sets with Accumulators require careful attention and owing to complications have a tendency to go out of order. Accumulators, if not regularly charged, whether in use or not sulphate and become useless.

"VOLEX" DRY BATTERY LIGHTING SETS give no trouble whatever. The Battery, which is fitted in a metal container with switchboard mounted on top, lies conveniently in the bottom of the sidecar and with ordinary care will last, when in use, from six months to eighteen months without renewal. New Battery can be fitted in a few minutes at but little cost. The Battery Case contains three separate Volex 4-volt Aero Dry Cells, with separate connecting boxes for the cables to Head, Side, and Rear Lamps. If one of the batteries becomes exhausted it can be replaced independently of the others. Unless specified, we always provide 4 volt Metal Filament Bulbs to each lamp, but 8 volt Bulb for Head Lamp will be provided where desired. Complete outfit (as illustration), including Head Lamp, Ball Pattern Side and Tail Lamps, 3 Volex Aero Dry Batteries in metal container with switchboard, 2 Sets of Metal Filament Bulbs, and Waterproof Conducting Cords. - - **Price £6/10.**
Spare "Volex" Aero Batteries **15/- each**

CAUTION.—We would warn users that they may be offered substitutes for the "Volex" Dry Battery. No other battery will approach in reliability, durability, or capacity the British Made "Volex."

Sectional List, "VOLEX" DRY Batteries free on request.

UNITS of the above outfit.

HEAD LAMP, with switch and cord..... 32/-
SIDE LAMP, with lamp holder and cord..... 18/6
TAIL LAMP, with lamp holder and cord..... 13/6

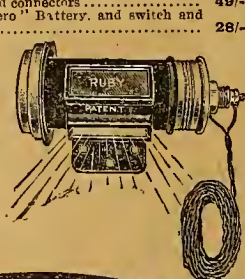
BATTERIES IN CASES, complete with waterproof conducting cord, to work in conjunction with own lamps.

Description	Price.
3 Volex "Aero" Batteries in metal container, with switchboard mounted on top, as illustrated	70/-
Ditto with 2 Volex "Aero" Batteries and switchboard, on pri-ing 2 switches and connectors	49/-
Ditto with 1 Volex "Aero" Battery, and switch and connector	28/-

THE "GEM" ELECTRIC REAR LIGHT

British Made.

Strong construction, neat appearance, ebony black body, nickel plated relief, fitted with ruby lens, white lens for illuminating number plate, and six feet of conducting cord.



Price 7/6.

Ward & Goldstone
SALFORD MANCHESTER

MOTOR CYCLES FOR SALE.

Enfield.

ENFIELD 6h.p. Combination, latest model, lamps, excellent order, 700×80 tyres; £140.—Edwards, 7, Exhibition Rd., South Kensington, S.W.7. [7381

ENFIELD Combination, latest model, lamps, horn, etc., only ridden a few miles; 130 gns.—Edwards, 7, Exhibition Rd., South Kensington, S.W.7. [7386

ENFIELD Combination 8h.p., 1916, 700×80 tyres, excellent condition, lamps, screen, horn; £125—30, Crystal Palace Park Rd., Sydenham, S.E. [6961

ENFIELD 6h.p. Coachbuilt Combination, hood, screen, lamps, etc., splendid condition; £110.—223, Hammersmith Rd., W. 'Phone: Hammersmith 80. [6511

ENFIELD 6h.p. Combination, 1916, fine condition, 2 new tyres and new coach body; £110.—Halifax Motor Exchange, Union St. South, Halifax. [6791

ROYAL Enfield, 3h.p., 2-speed, kick start, chain drive, in perfect order, with all accessories, new tyres; ride away; £45.—Spooner, Asylum Lodge, Warley, Essex. [6581

1917 Enfield 3h.p. twin, 2-speed, kick start, speedometer, Lucas lamps, smart appearance; £65.—Payne, Rosebay, Elm Grove Rd., Cobham, Surrey. [X4410

1919 8h.p. Enfield Combination, delivered July, any trial; evening after 6 or week-ends; private owner; £150.—Strathmore, Richmond Av., Westcliff-on-Sea. [7140

ROYAL ENFIELD 6h.p. C.B. Combination, accessories, excellent condition, new gears; £95, or near offer.—Bell, 24, Ashford St., Shelton, Stoke-on-Trent. [X3968

ENFIELD 1916 (October) 6h.p. Combination, Lucas lamps and horn, excellent condition throughout; £125, or nearest offer.—7, Court Rd., Kingswood, Bristol. [X4497

ALLEN-BENNETT Motor Co.—Enfield 1916 3h.p., 2-speed, T.T. model; £57/10.—9, 10, 11, Royal Parade, London Rd., Croydon. 'Phone: Croydon 2450. [7362

ENFIELD Late 1913 6h.p. Combination, engine recently thoroughly overhauled; any trial or examination; roomy sidecar.—Parker's, Bradshawgate, Bolton. [X4528

ENFIELD, 2¼h.p., 1911, any trial, £26; Armstrong Mark VII. 3-speed hub, complete, £11; approval.—A. Tate, Radcliffe Terrace, via Acklington, Northumberland. [X4147

ENFIELD Combination, perfect, hood, screen, speedometer, Klaxon, tyres (2) new, electric lamps, accumulator; after 6 o'clock; £140.—193, Eastcombe Av., Charlton. [X4242

1916-17 Enfield 6h.p Combination, condition as new, hood, triple screen, watch, horn, speedometer, spares; £140.—Osborne, 177, New Park Rd., Brixton, S.W. [7144

ENFIELD Combination, 8h.p., July, 1919, with hood, screen, and Lucas lamps, mileage 300, indistinguishable from new; 150 gns.—128, High St., West Bromwich, [7318

1917 3h.p. Twin Enfield, 2-speed, chain drive, lamps, mechanical horn, B. and B., adjustable carburetter, tip-top condition; £59.—36, Holland Rd., East Ham. (After 6 p.m.) [6558

1919 August 6h.p. Enfield Combination, 2-seater sidecar, hood, screen, mat, horn, mileage 300, perfect; seen Manchester; bought car.—Box L4,562, c/o *The Motor Cycle.* [7489

ENFIELD ⅝h.p. Combination, lamps, horn, recently overhauled, excellent condition; trial; £95, or near offer; before 6, or appointment.—Garaged, Dewick, 200n, Blackstock Rd., N.5. [6758

ENFIELD 1917 3h.p. Twin, 2-speed, K.S., ridden about 400 miles, all in new condition, unscratched; £60, or nearest offer.—Cawsey, 2, Wick Lane, Wickford, Essex. [7083

ENFIELD 1917 3½h.p. Twin, overhead valves, 2-speed, clutch, K.S., tools, horn, etc., engine guaranteed perfect; £70; after 6.—104, Vineyard Hill, Wimbledon Park. [6894

2¼h.p. Enfield 2-stroke, in practically new condition, engine No. 15266; what offers?—37, Dalehom Mews, Belsize Lane, Hampstead, London, N.W.3. 'Phone: Hampstead 4608. [6540

ENFIELD 2¼h.p. 2-stroke, 2-speed, new May, 1919, about 1,000 miles, Palmers, horn and tools; £65; new condition.—Charles Lyall, 15, Parkfield Rd., Didsbury, Manchester. [X4570

ENFIELD 2¾h.p., twin M.A.G. engine, 2-speed, F.E., chain drive, Bosch, B. and B., recently overhauled and renovated, ride away; £37/10.—Cope, 15, Upper Hagley Rd., Birmingham. [X4532

ROYAL ENFIELD.—Disabled, reluctantly parting with 1914 3h.p. twin, 2-speed, kick start, lamps, speedometer, tyres as new, stored during war; £50.—Lambert, 8, Mendow Rd., Southall. [6607

ENFIELD 1916 8h.p. Combination, complete with lamps and accessories, just overhanled, and in first-class mechanical condition; £130.—The Service Co., Ltd., 95-96, High Holborn, W.C. [7368

ENFIELD 6h.p.—Who wants a snip? Combination, excellent condition, Tan-Sad, and accessories, will take 5 up anywhere; £100, or near offer.—Apps, 12, Stanley Gardens, Hampstead, N.W. [7265

October 9th, 1919.

Motor Cycles in Emergencies.

THERE is a dwindling section of the community that looks on motor cycles as the toys of the gilded youth and, therefore, considers them as noisy useless contrivances fit only for week-end use. The war has done something towards dispelling this fallacy, but there are still some who little realise the importance of motor cycle developments. At such times as the present, the tangible results are particularly obvious, and should do much towards popularising both solo and passenger mounts. From the inception of the strike, motor cycles have been in demand in almost every quarter. Despatch riders for Government work, sidecar machines for the distribution of food and perishable articles, and any machine capable of propelling itself and its rider for the purpose of getting to and from work, even the oldest types, have been unearthed and pressed into service. Under such circumstances, it would not be surprising if a large number of breakdowns were noticeable, but our experience has shown that of the roadside stoppages during the past ten days, a very small proportion have been motor cycles. On the other hand, the loads carried have been phenomenal and greatly in excess of those for which the machines were intended by their designers. The motor cycle, and, we may add, the motor cyclist, is always ready in emergencies, and this fact must ultimately be noted by the public at large and by the very large number of firms whose business would be increased by the use of side-carriers for commercial purposes.

The motor cycle is no longer the crude vehicle of the past, but a reliable and satisfactory method of road transport, and additional proofs of this fact come to hand daily. The motor cycle, too, as stated by *The Daily Mail*, has been the vehicle on which many of the men, who are now so usefully employed in driving lorries, etc., began their acquaintance with the internal combustion engine. And it is impossible to exaggerate the use which the internal combustion engine has been to the country during the last few days of September and the beginning of the present month.

Competitions.

THE A.C.U. policy of strictly limiting the number of trials has been the cause of much discussion in both trade and club circles. With this policy we cordially agree. A plethora of open trials tends to confuse the buying public, and causes an unnecessary outlay on the part of competing firms. An idea is germinating in many minds that there should be a certain number of trials set aside for trade entries only, as exceptionally good or bad amateur performances must lead to confusion in the minds of those who decide on their future mount largely by its performances in competition work. Many an instance could be quoted of good machines failing under bad handling, and in a few exceptional cases a second-rate machine, if tuned up and ridden by an enthusiastic and skilled amateur, may put up a performance considerably better than that of the average machine. It is, of course, impossible to eliminate the human element, but a trade trial goes a long way in this direction, as no manufacturer would be likely to enter a rider who would spoil his record by bad riding.

The scheme of distributing open trials over various districts is as excellent as it is obvious; and if, as we hope, some of the smaller clubs amalgamate and form strong and well-organised bodies, some very interesting events may be expected in 1920.

Club events, as opposed to open events, are to be encouraged in every way; but their object is rather to foster the sporting and social sides than to improve the breed of motor cycles, and the smaller clubs, at any rate, would do well to concentrate on the type of event most suited to the majority of their own members, and leave the more strenuous work to the governing body.

An index to the advertisements in this issue will be found on the page facing the back cover.

Another Brake Contretemps.

HELL hath no fury like a woman scorned, and I have obviously offended the blind Fury with the abhorred shears by risking my neck somewhat freely in a gay and reckless youth. Anyhow she has come down on me this summer. This very morning as ever was, I found myself mounted on a new machine capable of 65 m.p.h. and confronted with as near as no matter a three-mile straight on a deserted moor. Apparently I was alone in the hemisphere. As any good motor cyclist would under similar circumstances, I opened the throttle till the Bowden wire all but parted under the tension. Presently a small red Devon bullock arose from the ditch bordering the moorland track, and wandered idly into the fairway, sniffing the breezes. When he realised that I was approaching after the fashion of a projectile, he started to jazz. I trod on the foot brake, as swerving at such a pace meant a parabola over the handlebars. Nothing doing. A nut on the brake connections had departed to join the nettles in the aforesaid ditch. Presence of mind always ranked high among my numerous fortes. I sloshed in second gear, which certainly retarded the machine, though it caused my nose to deal a vicious blow upon the centre of the handle-bar. Then I shut the throttle and dodged.

Vislok and Others.

WHEN I recovered a normal pulse, I dismounted and overhauled the machine to "pinch" a nut off some other part of its anatomy, and restore the brake to active service again. Incidentally, I meditated. The brake member in question was an extremely expensive job, ruined for want of a split pin. An American designer would have punched a hole through the tip of a bit of quarter-inch steel rod, threaded on a washer, and inserted a solid sort of split pin. Cheap, ugly, and effective. The Britisher had used about eight times the requisite amount of metal, indulged in five grossly otiose machine tool operations, and turned out a detail which was expensive, neat, and perilous to a degree. A few weeks ago I commented on a similar incident, and received sheaves of literature from Vislok and other indignant firms who manufacture perfectly good locknuts. I do not doubt their word. There are four or five studs or bolts on the machine in question which literally drip nuts on to the open road. I should love to vislok them, one and all. But there is not room for a double nut. There is not even room for a split pin. By the time I could get delivery of all the special gadgets required to render this jigger vibration proof, I should have exhausted all the copy and interest it contains and be selling it. Life is too short for a busy journalist to reconstruct every foolishly built machine he buys. What we motor cyclists are waiting for is a manufacturer who will sell machines from which nothing can conceivably come adrift. When his policy becomes known, nobody will buy any other make; and then—not before—all manufacturers will vislok or otherwise secure all their nuts.

One for the Spring Frame.

AS a rabid propagandist I cannot miss this chance of putting in a word for the cause. My stable houses a 1914 spring frame machine. It has not done the mileage which its age suggests, thanks to the Kaiser and other obtrusions: nor can I say precisely what distance lies behind it, for I got fed up with the speedometer drive, and that gadget is now on the shelf. But the beastie had exceeded 12,000 when I removed the screechy gears from its front spindle in 1917; and it has not been exactly idle since that date. Anyhow, this is the point. During this long and honourable existence not a single item has ever worked loose or fallen off except two small screws, whose profession is to act as pivots for the valve lifter. The moral is obvious. If you have an engine with some pretensions to balance (*e.g.*, a flat twin), mounted in a frame which is insulated by fore and aft springs, you won't shed assorted ironmongery on the public roads. On the other hand, if you have an engine which dithers the tails off any long letters embossed on its crank case whenever you accelerate on a low gear; and which is further mounted in a frame designed to attain the limits of rigidity; and if you further avail yourself of the latent r.p.m. of that engine on modern British roads, you ought to trail a magnet behind to pick up the bits which you will drop.

Driving on the Exhaust.

FOR many years past I have secretly cherished a shameful heresy, in that I have habitually "driven on the exhaust," in the sense of using the exhaust instead of the throttle for most of my slowings down or coasting. Of course, I acquired this bad habit in my early days, when our only throttle control was a stumpy lever mounted on the tank top; and when Bowden throttles came in, my prejudiced muscles were slow at acquiring the new habit. I used to blush when experts dilated on the superiorities of "driving on the throttle," and occasionally I schooled my errant fingers to rely almost wholly on the throttle if I were afflicted with a machine disfigured by a thoroughly bad exhaust lifter, *i.e.*, one which only raised the valve a millimetre or so, allowed a lot of petrol to be wasted, and led to explosions in the silencer. Since so many machines possess valve lifters, which do not lift the valve very far, or are short of leverage, I am now—when I like—an expert driver on the throttle alone. But I have no technical enthusiasm for the accepted practice. What you win on the Aunt Sally you spend on the roundabouts; for if you

Occasional Comments.—

keep your engine a little cooler by driving on the throttle, you also carbonise it rather faster. Furthermore, a man who, like myself, is perpetually riding different makes, is very apt to pile his machine up if he relies on the throttle, for his muscles may forget in an emergency which way the throttle closes, whereas no such blunder is possible if he stops on the valve lifter. Given a sensibly designed valve lifter, which prohibits finger cramp and banging in the silencer, I do not believe either method of driving has much vantage over the other. When I am driving subconsciously, I find I govern speed graduations with the throttle, but use the valve lifter to stop the engine.

T.T. or Tourist?

JUST a word to novices who are hesitating whether to buy the T.T. or the tourist model of the machine of their heart. The T.T. *cachet* has a very distinct attraction for the beginner, who knows that the machine will be lighter, livelier, and faster than the more stolid roadster type. He should remember, on the other hand, that it takes a good deal more driving. A young friend of mine, resident in a district where undulating hills of much severity and incredible twistiness abound, has just given a T.T. the preference, and wishes he hadn't. Since I retarded his ignition and packed up his cylinder, so as to lower the compression, he has doubled his enjoyment. To sum up the debit side of the comparison, the high compression engine is vastly inclined to conk whenever it is asked to pick up from a crawl, or to accelerate suddenly on a hill. Since no sympathetic driver allows his engine to conk, the result is an increase in the number of gear changes and the need for far more delicate handling of the carburetter and ignition levers. In really bad country, the most expert driver of a genuine T.T. engine will be perpetually twiddling with his controls, and even at that will often be forced on to second gear where a comparative novice could easily keep a roadster engine on top gear. So it all depends what your motor cycling ideals are. If you are primarily interested in the technical aspects, by all means get a T.T. and learn to handle it, but if you desire sordid utilitarian transport, and you desire to carry something frilly in a sidecar, a roadster is indubitably your mark.

Improving the Starter.

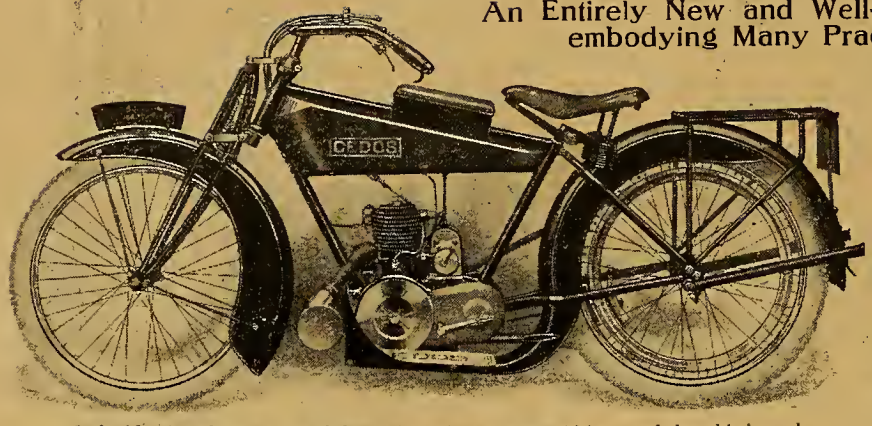
I CONGRATULATE the Phelon and Moore designer on having realised that the starting mechanism is one of the details of the average motor bicycle which shrieks loudest for improvement. Years of pedalling on the stand (what ridiculous figures we cut!) or pulling the back wheel round (and gashing our hands on the tail of the guard!) had bred such a hardy race that we hailed the first kick-starters with delirious and servile glee. Yet most of them are absurdly difficult to operate. During the war I noticed that the girl despatch riders were practically unanimous in despairing of their kick-starters, even when a sidecar was attached to the bicycle. A common sight on the Strand front displayed an immaculate subaltern pushing off a sidecar with a khaki-clad maiden at the helm; when the engine fired, she declutched and waited till his breathlessness overtook her and clambered in. It may be urged that such machines were usually in very poor tune, owing to hard usage, indifferent driving, slipshod repair work, and bad fuel. Yet these are exactly the conditions which prevail in seven private garages out of ten. Almost any sort of apology for a kick-starter will serve the needs of a flat twin or a small V: they are easily bounced over compression, the resistance is slight, and proper co-ordination of the valve lifter and starting pedal does not particularly matter. But a girl or a beginner will usually experience some difficulty in kick-starting a "tight" single-cylinder; and a big V may be even more troublesome. I am not at all sure that the push start on second gear is not still the easiest method of starting the majority of solo machines from cold; and this is an absurdity in the year 1919. Insufficient leverage and an awkward angle are the two commonest faults in kick-starters; both appear to have been exorcised from the new P. and M., and unfortunately for the designer, neither alteration is patentable.

THE STRIKE—MOTOR CYCLISTS TO THE RESCUE.

In response to the Government's appeal for volunteers to help in food transport service immediately the railway strike started, many motor cyclists at once offered their services. The photographs show them enrolling at Park Street, Portman Square, London.

THE 2¼ h.p. CEDOS.

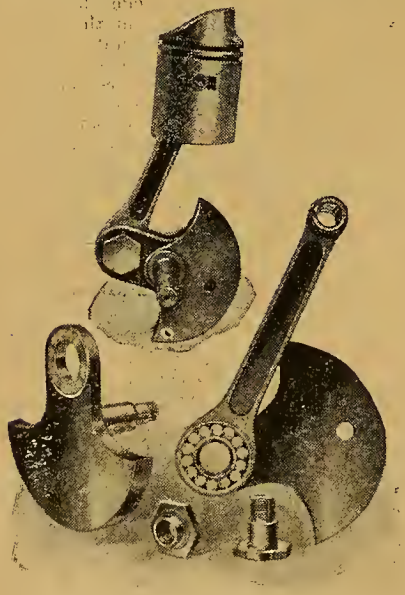
An Entirely New and Well-designed Lightweight embodying Many Practical Features.



Left side view showing one of the brake pedals. It should be noted that this is on the same fulcrum as the pedal on the opposite side, but extends rearwards instead of forwards as is the case with the right side brake. Thus the rider has a brake pedal convenient to his foot in whatever position on the foot-plates his feet may be placed.

THERE are two ways of constructing a reasonably priced motor cycle; one method is to skimp finish and fittings, and the other is to lay out a design in the first instance for mass production, every part being designed so that it is immediately interchangeable and drops into its place without any unnecessary fitting. The former method is, unfortunately, so common that it is a real pleasure to examine a machine falling into the latter class.

Messrs. Hanwell and Sons, Components, Ltd., Northampton, are about to market one of the most carefully thought out lightweights that we have yet been privileged to examine. In spite of the fact that at the present moment only one complete machine has been built, there are absolutely no loose clips or fittings of any description. Every detail is so designed that it is brazed or welded directly to the particular part of the frame to which it belongs, and, in consequence, there should be a minimum of rattles.



(Top) Piston, connecting-rod, and crankshaft assembly. Note the method of fixing the gudgeon pin.

(Bottom) The built-up crankshaft, showing method of fixing, and the roller big end.

Three-port Ball Bearing Engine.

The engine of this machine is a 2¼ h.p. two-stroke, having a bore and stroke of 62 × 70 mm. It is of the usual three-port type, and is designed and made entirely on the company's premises. There are no very unusual features about the power unit, with the exception of the fact that all parts are beautifully made, and that the crankshaft, which runs on ball bearings with plain bearing compression retainers, is built up of two parts, in a rather ingenious manner. The driving side of the crankshaft is constructed in one piece with the crank pin which registers in a hole in the crank web on the magneto drive side, the two parts being held together by a bolt passing through the middle of the pin. Both the inside of the pin and the outer diameter of the bolt are carefully ground to size so as to ensure an accurate and tight joint.

A roller bearing big end having Hoffmann rollers is employed, and the connecting rod, which is a particularly fine piece of work, is a very light steel stamping carefully case-hardened in the race and on the sides abutting the inside of the crank webs.

Piston Machined All Over.

A light piston carrying two rings at the upper end is fitted, and has a head formed in such a manner that it can be machined over the entire surface, inclusive of the transfer side of the baffle. The hollow gudgeon pin is ground very slightly taper, and is locked in position by a spring clip passing through holes in the pin and locking into corresponding slots in the piston.

All ports have been carefully designed, and are divided into two parts, so as to prevent the piston rings from catching.

Lubrication is effected by a sight feed drip, the oil being conducted to a point in the cylinder wall opposite the end of the gudgeon pin. Thence the lubricant is collected in a groove round the baffle plate in the top of the crank case, and is led by drilled ducts to the compression retaining bearing on either side of the crankshaft. Each of these bearings is provided with an internal and helical groove cut in such a manner that the oil is drawn inwards towards the centre of the crank case.

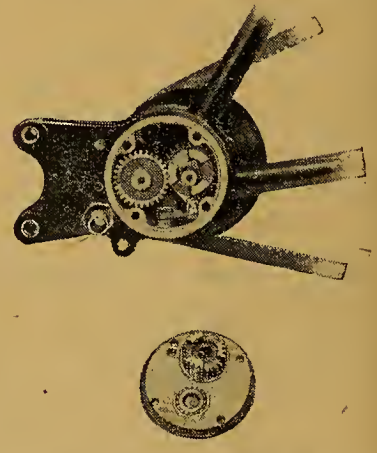
Features of interest are common, one of the simplest being that studs are not employed for holding down the cylinder, but bolts are passed right through lugs at the base of the cylinder and at the top of the crank case casting. This obviates any possibility of studs becoming loose in the aluminium.

A comparatively small diameter flywheel is fitted, and the transmission to the gear box is by ½in. × ¼in. chain.

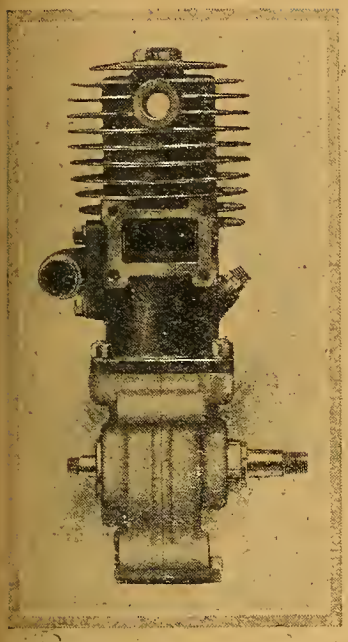
The carburetter employed is very ingenious, but we are unable to describe it fully at the present moment, owing to the patent being still incomplete. The strong point of this carburetter is that it embodies a variable choke, and enables the engine to run extremely slowly and two-stroke regularly.

A Sane Gear-box Mounting.

A very simple two-speed gear box of the constant mesh type is enclosed in a circular box, and this box in its turn is fitted into a circular lug, which forms the bottom bracket of the frame. Both box and lug are carefully machined to fit, and the box is positioned by a large split clip. To adjust the tension of the driving chain, it is, therefore, only necessary to slack off the single bolt holding this clip, and rotate the gear box through a few degrees by means of a tommy-bar. This method of fixing prevents any possibility of the chain wheels getting out of line, and as the dogs are operated by a



Contained in a circular case, the Cedos gear box is of the simple dog clutch type. The main driving pinion is supported on a ball bearing carried in the spigoted cover plate.



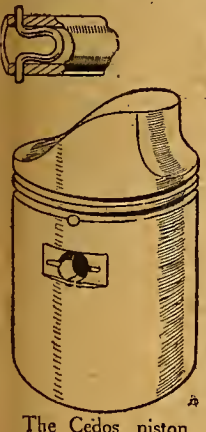
Front view of the engine, showing the exhaust outlet with machined ports.

Bowden control, a movement of the gear box does not entail any adjustment to the gear control. This control is operated by a thumb lever directly below the spark control, and in a similar manner to the throttle lever.

The final drive is by a ⅜in. belt running over a 6in. front and 18in. rear pulleys. In this connection it must be mentioned that the belt is so guarded that slip should be unknown.

The valances of the rear mudguard come well down to the belt rim, and a special underscreen is so arranged that it forms the lower part of the rear mudguard, spreading out on either side to the aluminium footboards, and terminating at the front end in a shield, which effectually protects the lower part of the rider's legs from mud thrown up by the front wheel.

We have seldom seen more complete arrangements made for the manufacture of frame and fittings. Every frame is constructed on special jigs, so that it is to all intents and purposes impossible for any variation to occur.

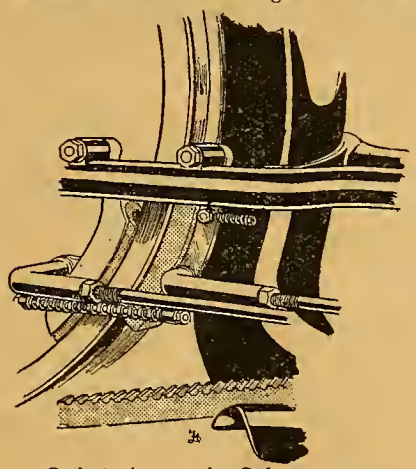


The Cedos piston, which is machined all over. The inset shows an enlarged view of the gudgeon-pin fixing.

Special forks are constructed by the manufacturers, which are very neat and light, although their strength has been well tested and proved. They are attached to the head by the usual parallel links, and their action is limited by a compression spring situated between the blades of the fork. The lower end of this spring is carried on a bridge piece integral with the fork, and the upper end by a swivelling housing connected to a lug at the bottom of the steering column. The top links are somewhat shorter than those at the bottom, so as to provide the double motion necessary for good front springing. Incidentally, it should be mentioned that the steering head is unusually long, and the ball races large.

In spite of the sloping top tube, which gives the machine a neat and practical appearance, the tank holds almost two gallons of petrol. The colouring of the motor cycle is in a shade of purple, the frame being of a slightly deeper tone than the tank.

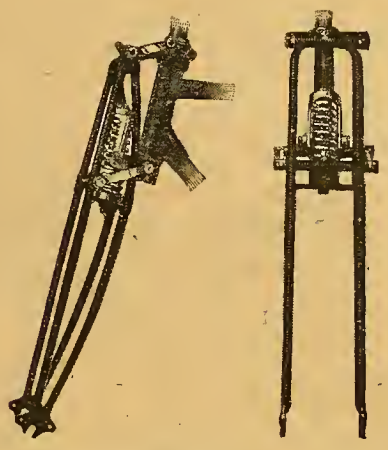
The manufacturers do not believe in front wheel brakes, and, consequently, we find two brakes acting on the belt rim—one on the inside of the V is operated by the right toe, and one on the outside of the V by the left heel. The brake rods are neatly arranged and lie parallel to each other, and a single coil spring serves to return both shoes to their "out of action" position.



Both brakes on the Cedos operate on the belt rim, and have a common take-off spring.

24in. × 2¼in. tyres are used, and every part of the machine, with the exception of rubber and leather goods and ignition appliances, is manufactured in the firm's own works.

A detail which shows the practical mind of the designer is instanced by a small portion of the magneto chain case, which is quickly detachable, so as to provide easy access to the rear cylinder nut, which would otherwise be somewhat inaccessible.



Of the parallel link type, the Cedos spring fork embodies a single coil spring centrally disposed.

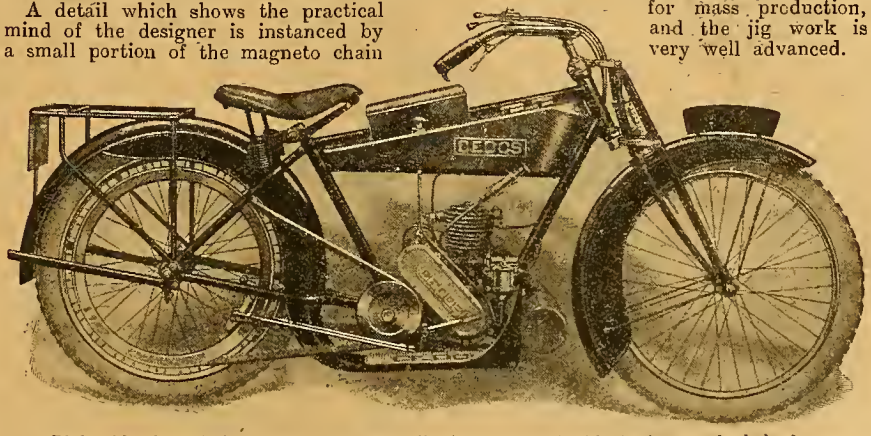
A Quiet Exhaust.

A very large silencer, placed in front of the underscreen, and having a long flat pipe, renders the exhaust reasonably quiet, and the enclosed release valve is practically noiseless when in operation.

The cooling of the engine appears to be extremely efficient, and, though our ride was too short to allow of a long run on full throttle, we were assured that it is practically impossible to dry up the engine, and we certainly saw no indication of this trouble. In this connection a rather interesting feature is noticeable, in that the top fin is formed by a detachable copper rib, held in position by a plug in the centre of the cylinder head. This serves a double purpose, in that it assists the cooling of the most vital point on the engine, and also saves the fracture of the top rib, which is a rather common occurrence when cast iron is used.

It is Messrs. Hanwell's intention to market the little machine at a reasonable price, though no definite figure can be given at the present moment. Deliveries will commence in January.

The works are being carefully laid out for mass production, and the jig work is very well advanced.



Right side view of the Cedos two-stroke, illustrating the double brakes on the belt rim, and one of the conveniently placed pedals.

Motor Cycle Design in Holland.

The 3½ h.p. Simplex, embodying an Unconventional Frame, English Components, and M.A.G. Engine.

A Dutch production. While being particularly "English" in style and finish, the Simplex is full of novelty although quite free from freakishness.

ALTHOUGH the Simplex machines have never been introduced commercially into this country, they have been known to many riders for their general excellence of workmanship through the friendly meetings resulting on the Anglo-Dutch trials, which were so popular before the war.

The present design now before us, which is to be placed on the market next year, is of very taking appearance, and embodies very sound principles of frame construction.

An extremely low saddle position, barely twenty-eight inches above the ground, is possible with the design, which is of duplex construction throughout, and has continuous members running direct from the steering head to the back fork ends.

The saddle is placed as nearly as possible midway between the front and back wheels, since it is here that the minimum of road vibration is felt by the rider, the machine, as it were, oscillating about the centre point, which consequently deviates less than any other part from a path parallel to the ground during its forward travel.

A Sporting Touring Model.

Druid Mark II. forks are fitted in conjunction with flat handle-bars of the semi-T.T. type, and the latter are fitted with Pedley pneumatic grips, which we know from experience are extremely pleasant to the hands, especially on long journeys.

A 3½ h.p. twin M.A.G. engine is fitted, with magneto placed in a well protected position behind the rear cylinder. Lodge weatherproof plugs are used, while gas is supplied by an Amac carburetter.

Transmission is by chain and belt through a three-speed gear box with handle-bar-controlled clutch, while a powerful kick starter is fitted on the right-hand side.

Transmission and Brakes.

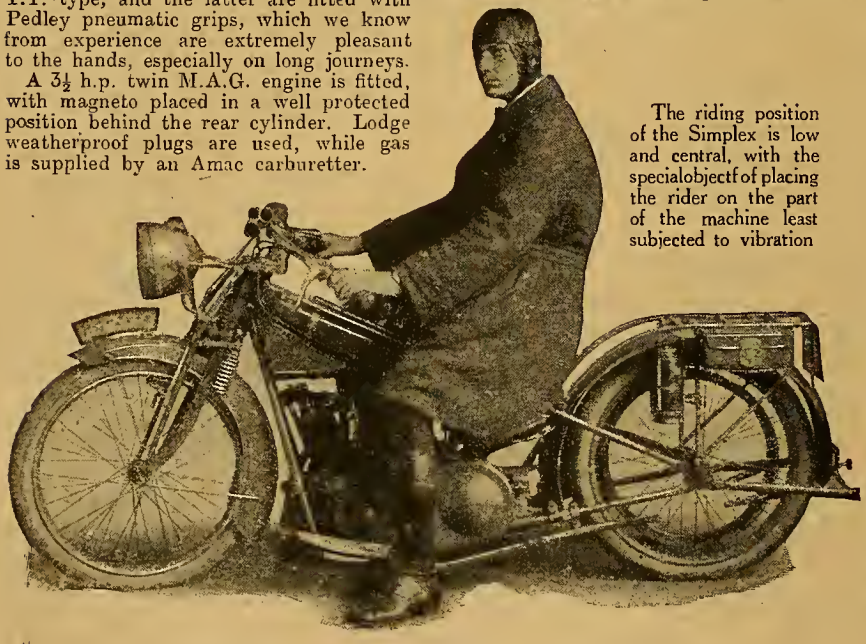
The final drive is also on the off side, somewhat similar to that of the 4 h.p. Douglas, but the large diameter pulley and belt lie within the duplex frame, which is extremely wide—this construction avoids the use of cranked tubes, necessary on most conventional designs where the transmission is outside the frame members.

A belt guard is provided, and as the belt centres are wider than on most countershaft machines, the bugbear of belt slip on low gear should be largely obviated.

The petrol and oil tanks are separate, the latter being at the top of the frame and fitted with a Benton and Stone oil pump and drip feed. Immediately below the steering head, and occupying the triangular space between the oil tank and the top of the engine, is a metal receptacle suitable for carrying tools or spares.

Brakes follow standard British practice, that on the front wheel being a Bowden, while the rear is of the compensating type working in the V of the belt drum—it will be noticed that enormous leverage is obtained both on the pedal situated beside the right-hand aluminium footboard, and also on the arm of the brake itself.

Altogether the design is clean and workmanlike, and reflects credit on the makers, the Simplex Cycle and Motor Co., Amsterdam, Holland.



The riding position of the Simplex is low and central, with the specialobjectf of placing the rider on the part of the machine least subjected to vibration

"MAGNETOS." *

THERE is no keener class among motorists than motor cyclists. We feel sure, therefore, that the above book, written by A. P. Young, A.M.I.E.E., will appeal to a very large number of motor cyclists, whether they are interested in the internal combustion engine as a pastime, or engaged in the actual production of engines.

The above work, which is written by an expert engaged in the actual production of one of the best known magnetos, deals with all British-made magnetos, both theoretically and practically. Among the items which will appeal strongly to motor cyclists, and about which we are constantly receiving enquiries, are the magnetising of the magnets, the timing of the magneto, magneto testing, etc.

Other valuable features are detailed illustrated descriptions of practically every British-made magneto on the market, including aeroplane magnetos, illustrated by sectional drawings, showing how the rotating armature type of magneto differs from the polar inductor type. The language employed is as simple as possible, so that anyone with a rudimentary knowledge of electricity can readily follow the text.

The Outlook for Motor Cycles.

AN ANALYSIS OF SUPPLY AND DEMAND. By Major R. Vernon C. Brook, A.M.I.E.E.

THE year 1919 is now far advanced, and there are still thousands of would-be motor cyclists who have not been able to obtain delivery of machines ordered long ago.

Motor cycling is no longer a seasonal pastime, though, to appreciate its joys to the full, one must have fine weather; and the utility motor cycle, used for business purposes, or for carrying its owner from his home in the country, or suburbs, to his business in town, is in use all the year round.

Motor cycle manufacturers, like all others engaged in the engineering industry, have been, and still are, labouring under many difficulties as regards production, labour troubles, "going slow," shorter working hours, new designs, new hands, new tools, and, in some cases, new factories, which have all conspired to make the manufacturer's bed one of thorns rather than of roses.

On all sides one hears the remark that the big output aimed at cannot be attained by a very wide margin. Some makers are better placed than others, particularly the older ones, who receive preferential treatment in the matter of raw material or accessory supplies from the firms with whom they have always dealt; but the raw material suppliers are in a similar plight, owing to the difficulties of the transition period and of getting labour into its full swing again.

As the Prime Minister recently remarked, the whole nation is suffering from "shell shock" and from the reaction following on the greatest war the world has ever known. I think the remark is as true a one as any the Prime Minister ever made; and, in consequence, I base hope upon the fact that, just as surely as the majority of shell-shock cases can be cured, so will labour—and in labour I include all those who work, from the highest to the lowest—recover from its present convalescent state, and attain such vigorous health and strength that outputs never dreamed of before the war will be the certain sign of recovery, and big output brings its own reward to all who help attain it.

Why is Enormous Output Necessary?

One hears on all sides that there is to be a boom in motor cycles. Undoubtedly the next few years will see more motor cycles on the road than ever previously; the motor cycle is the pleasure vehicle of the multitude, from the artisan to the bank clerk, all will want motor cycles, and the more there are turned out, the cheaper they will become and more men will be able to buy.

How many motor cycles will there be in 1921, say? Well let us see. In 1913—the last full year prior to the war—over 180,000 motor cycles were registered in the United Kingdom, being in excess of the number registered in 1912 by nearly 39,000, and showing an increase of more than 20% for the year.

These 39,000 machines were not all made in this country, as 1,700 motor cycles were imported during the year, as compared with 1,380 in 1912, which, deducted from the above figure, leaves some 37,300, which may roughly be taken as the number of machines manufactured for the home market. In addition to these machines, 17,000 motor cycles were exported in 1913, so that the two figures added together give 54,300 as roughly the number of machines made in the United Kingdom in 1913—a figure very much larger than one would state if asked to give an estimate.

The Lost Years.

Now, up to the end of 1914, the motor cycle factories did not slacken output to the public more than 50% probably—that is the factories which were not supplying machines for war purposes—but several of the largest factories devoted their output exclusively to the War Office, so that it is probably safe to assume the total supply of motor cycles to the public during 1914 did not reach more than 50% of the supply in 1913. The years 1915, 16, 17, and 18, and the first half of this year, were almost dormant, so far as the motor cycle production for the public was concerned, so that before normal conditions are reached, the loss of output during these years has to be overtaken, together with the increased demand.

To err on the safe side, suppose the increase of 54,300 shown in 1913 over 1912 had been maintained during the last four years, leaving the war period of 1914 and the first half of 1919 out of account, then an additional 217,200 motor cycles would have been manufactured in this country.

I think with the increased popularity which the motor cycle was beginning to enjoy in 1914, and its increased use by tradespeople, there is little doubt that this increase would have been at least maintained, if not exceeded, during these four years, so that the figure may be taken as a moderate one.

Mass Production.

Now, during the war some of the few motor cycle factories making machines for the W.O. have been extended to obtain greater production, and all have learned more of the methods of mass production. In 1913 there were not more than a dozen motor cycle firms turning out over 2,000 machines each per annum: it is doubtful if there were as many as a dozen. Of the

The Outlook.—

remaining twenty-three makers, who go to make the total of thirty-five firms, turning out more than 500 machines a year, very few reached 1,000 machines per annum.

To-day some of these firms are planning for 5,000 or even 8,000 machines per annum, and in addition there are a number of new firms, say half a dozen, who are laying out for 5,000 machines per annum, to say nothing of the firms which are planning to produce motor cycle engines on a big scale, which engines will be absorbed by the numerous small motor cycle builders not included above, of whom there are at least two dozen, each turning out, or capable of turning out, five or six machines a week.

Making allowance for the disappointments which some of the big output planners will undoubtedly experience, it may be safely assumed that, given a return to normal conditions, the commencement of the 1920 season should see a return to the output of 1913, namely, 54,300, plus, say, 25% increase all round—quite a liberal figure, in my opinion, and I know something of the present position in many works—which gives a total of 67,900 machines per annum amongst the makers who existed in 1913. Assuming that six big new firms will produce by next spring 15,000 machines per annum, added to which there are, say, twenty small "assemblers" who on an average will turn out machines at the rate of five a week, and we get a further 5,200 machines per annum, making a grand total of 88,100 machines per annum to meet the estimated shortage of 217,200 motor cycles which exists to-day, and by the time the above estimated outputs are in full swing the shortage will be greater still.

To relieve the situation a number of machines will undoubtedly be imported from America, though whether they will come in large numbers with the 33⅓% duty, 15% extra to cover difference in rate of exchange, and a big leeway to make up in America, seems extremely doubtful, particularly as the output of the American factories is down too.

The imports from all countries in 1913 amounted to 1,700 odd machines; there were no restrictions, no duty to pay, American prices were lower, the rate of exchange was normal, and the Americans were anxious to get into the British market. With the existing conditions, is it likely that the imported machines will be more than trebled in number? For the sake of argument, say the figure becomes 5,100. This increases the 88,100 machines to meet the shortage to 93,200, or not quite half of what is required.

This is assuming the British manufacturer decides to keep all his productions for the home market—which unfortunately appears to be the case in many instances—rather than export to the Colonies and abroad in order to prevent the market falling into American hands, and also in order to help to reduce the cost of imported necessities. The demand for machines for export, which numbered 17,000 odd in 1913, is also short by very large numbers—perhaps not so short proportionally as we are at home here, as the demand has fallen off for many reasons, and America has been very busy in our pre-war markets.

No Immediate Fall of Prices.

To sum up, then, it seems very likely that it will take at least two years to meet the present shortage: probably four or five years will be the time required to overtake the demand, during which time the demand is steadily increasing, so that there is little hope of a fall in prices, unless every other commodity falls as well. Manufacturers can go ahead with every confidence, and the workers in the factories need have no fears of producing too many machines: they cannot produce too many whatever happens, for the more they produce the more will be sold, both at home and abroad. Prices will only come down when big production is made and the supply is equal to the demand; then when prices come down the demand will increase again beyond the limits of supply.

The prospective buyer who waits for a drop in prices is likely to be disappointed, unless he is prepared to wait for two to two and a half years, for, with the present more equal distribution of wealth, there are thousands waiting to buy and prepared to pay fancy figures if only they could lay hands on the machines of their choice.

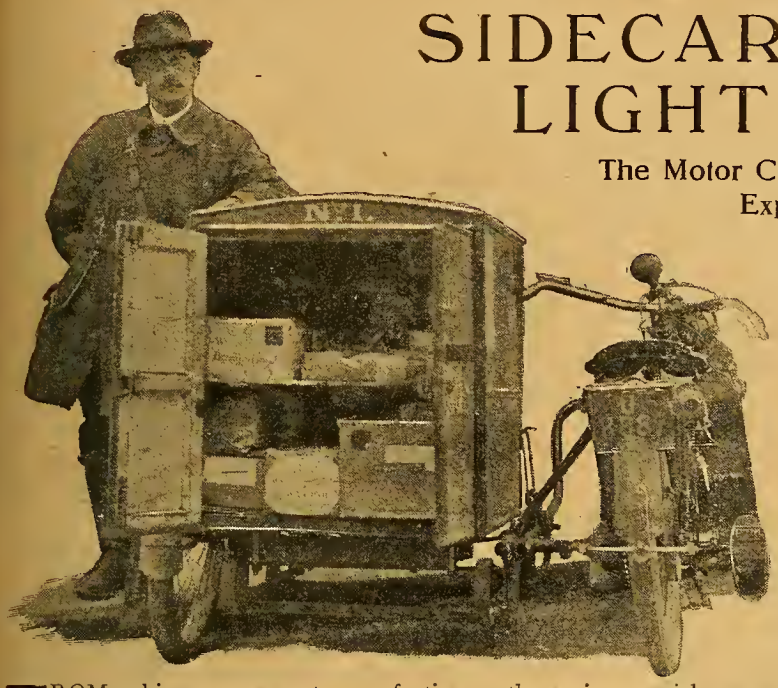
SIDECARRIERS FOR LIGHT DELIVERY.

The Motor Cycle as an Aid to Cheap and Expeditious Transport.



In almost every sphere of life motor cycles now play a part, and their scope widens as progress is made in design, permitting persons without mechanical knowledge to drive them without trouble. The simplicity of the average motor cycle, its comparatively low cost and undoubted economy, are all points in favour of its becoming more generally adopted by tradesmen for delivery purposes. In the following article are set forth many of the advantages of sidecarriers for light delivery.

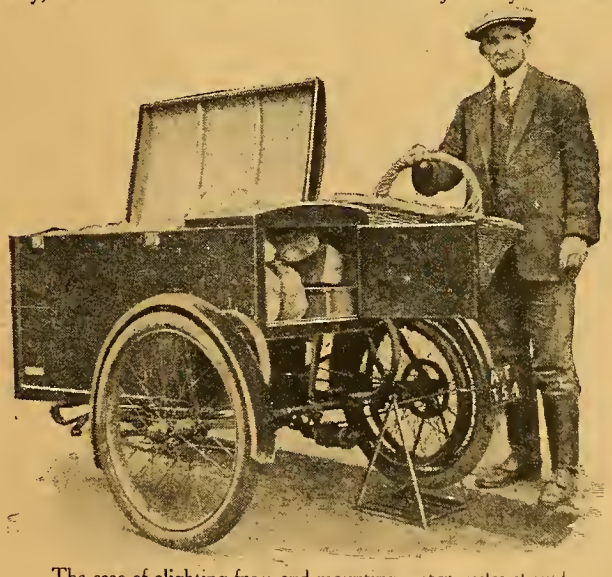
FROM chimney-sweep to confectioner there is scarcely a tradesman who cannot use a sidecarrier with advantage. Time has always represented money, but it represents a greater value than ever to-day, and one may anticipate that the motor cycle will play an important part in preventing waste of time, which is such a serious item in every business.

The solo motor cycle is already a welcome and fully recognised means of quick transportation for men who hitherto have walked, but we are concerned at the moment with the delivery of light goods such as, before the war, employed a vast army of horses, carts, and youths, which, costly as it was to the tradesmen, failed to give entire satisfaction.

One has only to recall the spirited horses and the reckless youths in butchers' carts to realise that in this direction alone lies an enormous field wherein the sidecarrier can become the general means of delivery, and that such service would be of great advantage both to the butchers and their customers. The butcher's cart has always been a fast vehicle, but its speed has sometimes been a risk to the public. The sidecarrier could increase this speed, and at the same time reduce the risk, as a motor cycle moving at 20 m.p.h. is well within control of the driver, whereas a horse approaching this speed is at a mad gallop, and impossible to bring quickly to a standstill.

A sidecarrier designed for delivery of stationery and office equipment.

What applies to the butcher can easily apply to the baker; but, instead of dragging round half a ton of bread to cover the round, the sidecarrier would carry, say, a third the load and make return journeys to the bakery when required. It requires but a few minutes for a motor cycle to run a couple of miles, but for a horse and cart to do this would be a serious loss of time; furthermore, odd items may be cheaply delivered, but the large van is not economical unless worked to its full capacity.



The ease of alighting from and mounting motor cycles should appeal to bakers who have many frequent halts.

Very few drapers employ a delivery vehicle. In a Midland city of 120,000 population, which has several

S.decarriers for Light Delivery.—

large drapery establishments, only one has the means to deliver his customers' orders, and that draper employs a side-carrier. This vehicle gives this enterprising tradesman several great advantages over his competitors. Not only is he able to send his customers' purchases, but, being on the telephone, an ever-growing circle of customers are getting into the way of placing their orders over the 'phone, because they know purchases will be delivered quickly.

The Value of Prompt Delivery.

Every smart tradesman knows the value of being able to give prompt delivery. To deliver all customers' purchases is an asset in itself, but to do this promptly

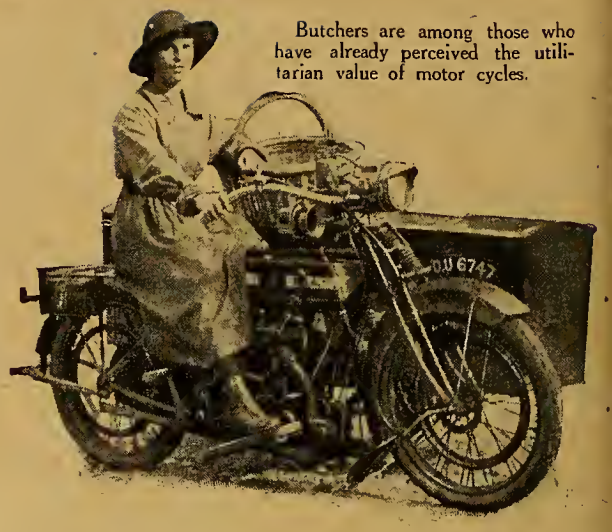
A roomy side-carrier used by a grocer.

considerably enhances the value of that asset. One draper of the writer's acquaintance has built up a large business by making a rule of delivering all goods purchased over his counter. To deliver a packet of pins as a matter of course, just as he would a ten-guinea coat, is his greatest advertising medium, and for this purpose he keeps two smart sidecar outfits run by youths in uniform.

Before the war there was ample evidence to show that a motor cycle for light delivery was a much better proposition than horse delivery, there being a saving of upwards of 50% with the former. There is every reason to believe that the saving is even greater at the present time if only because of the increased cost of labour, which makes time such an important factor.

Even before the war the cost of fodder and stable materials for two horses to give the same service as one motor cycle was higher than the cost of oil and petrol sufficient for sixty miles per day, and one tradesman had carefully calculated his costs, and found that he could deliver daily 180 parcels of 10 lb. each at a total cost of ¾d. per parcel.

A poultry farmer who finds the motor cycle of great use in transporting eggs.



Butchers are among those who have already perceived the utilitarian value of motor cycles.

Several bakers found that delivery by motor cycle cost only half the expenses in connection with a horse and van.

In hilly districts especially is the side-carrier found a great money-saver. One has only to call to mind the slow progress of a baker's or butcher's cart up long steep hills and the hill-climbing capabilities of the side-carrier to appreciate this.

Reverting to the question of time-saving, which in these days means considerable money-saving, it has frequently been demonstrated that with a horse and van certain "rounds" have taken 5½ hours, which have only occupied 3½ hours with a side-carrier.

Another great advantage of the motor cycle for light delivery is that the small tradesman, by having two bodies for the sidecar chassis can use the machine for pleasure during the week-end.

A point greatly in favour of the side-carrier is that it can be made a valuable mobile advertising medium, and many kinds of unique carrier bodies have been devised to attract attention.

Roughly speaking, the field of the side-carrier can be divided into two sections: the small tradesman using one or two machines, and the big stores which use them as auxiliaries or tenders to large capacity vans, while London and provincial newspapers use sidecars with success to distribute their several editions. The side-carrier is also used by wholesale newsagents.

As to the most suitable type of machine for delivery work, this is obviously largely dependent upon the weight of the goods to be carried. The "big twin" may be considered first, but for many tradesmen a single of 550 c.c. should be quite suitable: in fact, the single-cylinder machine has been used in greater numbers than the twin, the reason probably being the greater simplicity of the former. However, it may be said that the majority of modern

"Lycetts."

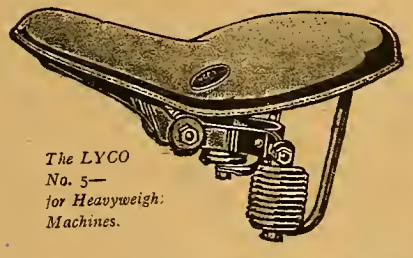
Two Seats
which yield the Maximum of Comfort

The LYCO No. 5, which is specially designed to meet the needs of riders of Heavy-weight machines, and the LYCO No. 6 for the Light-weight. The LYCO Anatomically-shaped Pan Seat Saddles are scientifically designed, faultlessly finished, and embody our well-known Patent LYCO Spring Action.

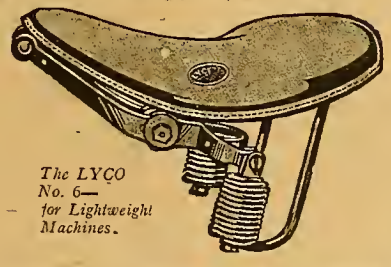
This is the LYCO Spring-principle—

The saddle is hinged at its peak, and its special springs are anchored dead-centrally at top and bottom on two swivel fastenings, which ensure a perfectly straight pull, eliminate twisting strains, and obviate breakages. The hinged peak, swivel action on the spring, and dead central pull, allow the saddle to describe a circular movement at the back when the seat is depressed under the rider's weight, thus giving easy motion and fullest comfort.

If you want to tour in comfort, with a freedom from strain and fatigue, or enjoy every-day riding to the full, you will find no system to equal the LYCO Spring-principle.



The LYCO No. 5— for Heavyweight Machines.



The LYCO No. 6— for Lightweight Machines.

Sidecarriers for Light Delivery.—

machines of 550 c.c. upwards are quite suitable for light delivery work.

It is obvious that, to obtain the full benefit of sidecars for light delivery, a suitable carrier must be provided. In several provincial towns small tradesmen are using passenger sidecars for this purpose: a practice which is not to be recommended for several reasons. First, the capacity of the body is very restricted for the accommodation of boxes and parcels; secondly, the upholstery is very quickly damaged, and soon the body is rendered useless for either passenger or delivery work; thirdly, the advertising value of delivery by motor cycle is lost.

Most sidecar manufacturers make delivery sidecarriers suitable for almost every business, and tradesmen should not find any great difficulty in procuring an outfit to suit their requirements.

The services of a smart youth or young woman should be easy to procure: more easy, in fact, than if a driver were required for a horse-drawn vehicle. A large number of drivers of the W.R.A.F. and other forces in which women have been employed have been demobilised and are available. It may be found that some of these young women will be willing to accept positions as drivers of side-carriers, and, if so, that they will be more satisfactory than the average youth, although the latter would be keen to be so employed.

To summarise, there is no doubt that the side-carrier will solve the delivery problem for hundreds of tradesmen, and that an increased number of such vehicles will be seen as time goes on.

A New Field for Manufacturers.

Although the conventional machine sold for passenger work will be found quite satisfactory, there is undoubtedly a great field for the maker who will produce a model specially designed for light delivery. Such a machine should have a moderately low compression, be simply and sturdily built, and need not embody the refinements of the touring mount.

Parts likely to suffer through exposure to the elements should, of course, be enamelled, and such equipment as lamps and horns would be better if embodied as part of the machine instead of as a detachable accessory.

VEDETTE.

American Motor Cycle Club Life.

Extracts from our United States News Letter.

THE second annual motor cycle field day of the New Jersey M.C., held on September 14th, brought out 828 motor cyclists and their friends on 329 machines to the rallying place, Seidler's Beach.

Three special awards were made for neatest solo and sidecar outfits, and longest distance travelled by anyone attending. Prizes were won by riders who had machines that had gone more than 10,000 miles each. 172 miles was the farthest anyone rode to attend.

Eight novelty events were run off—five for solo, three for sidecar. Big thrills were in the cross country solo and sidecar and the sidecar pursuit race. One machine somersaulted in the water, but without damage to riders or machine, although it was a close call.

The 1920 Harley-Davidson seen at the beach has longer forks than the current model. These project above the handle-bar line, affording longer springs and easier riding. The head light is placed above the old position, covering any awkward lines the new forks would give the machine, while the Klaxon horn is occupying a position originally used for the lamps. A new tail pipe with plugged end and saw-cut notches for relief of exhaust gases is a feature, as is the new cut-out on the muffler shell. This is a particularly lusty cut-out, and it is hard to reconcile the Harley-Davidson attitude of "Cut out the cut-out" with this new silencer shatterer.

A new four-cylinder outfit is on the way to production in America. It is to be built in Philadelphia, the motor cycle to be designed by Wm. Henderson, designer of the original Henderson Four, and financed by J. W. Grady (New England B.S.A.) and Max Sladkin (Haverford Cycle Co.), owner of a chain of ten motor cycle and bicycle stores in the principal cities in the United States. It is rumoured that a machine is to be road tested this month for the first time since organisation, and the company hopes to be in production by February.

A UNIQUE SNAPSHOT. In a beach race organised by the New Jersey M.C., one competitor steered so abruptly round the turning point that his outfit overturned. No serious damage was done.

Our club programmes are apt to be a little more snappy than those issued at home. These extracts from that of the Seidler's Beach affair are just a shade less staid and formal than you will be accustomed to:

"Carl W. Bush Co. Gallop (for solo riders).—Ride halfway to a turning point, dismount and push motor cycle, with engine *not* running, around post, start motor, and ride to finish. Get off and push, laddie buck. Three good prizes donated by the Carl W. Bush Co.

"Joseph B. Werner Scramble (for sidecars only).—Sidecars line up in ring and ride until they have eliminated others or have been eliminated themselves. Passengers must work to help their man win. All set? Les' go! Three merchandise awards donated by Jos. B. Werner.

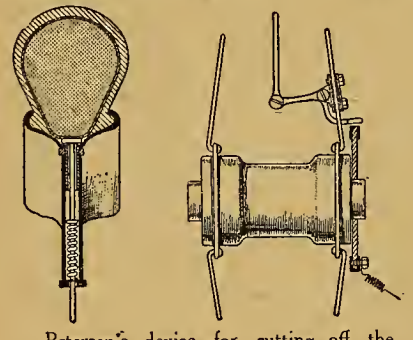
"The Sidecar Run and Ride (sidecars and passengers only).—Machines at one end of field, crews at other; at the word the crew start running for their machine, start the engine, and ride to the finish. It calls for team work. One set of prizes for the winning crew only is all we could dig up, fellers."

E. B. HOLTON.

RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

MR. PETERSEN, of Copenhagen, proposes that a punctured tyre may automatically switch off the engine. To effect this, he fits a T-headed striker in much the same position as a security bolt, equipping it with a guide and a small coiled spring, which keep its head pressed against the inner tube. The tip of the striker is suitably linked to a switch on the hub, connected by a wire with the ignition circuit. When your tube deflates—little or much, according to your ideas on the adjustment of the device—the striker follows the tube into the cover, the switch is operated, and the engine stops instanter. A number of minor criticisms might be offered: for example, if you go through a water-splash, your engine will infallibly be stopped in the middle. But the main weakness of the gadget, of course, is that only an indiarubber-skinned man in a very superbly sprung motor can remain in

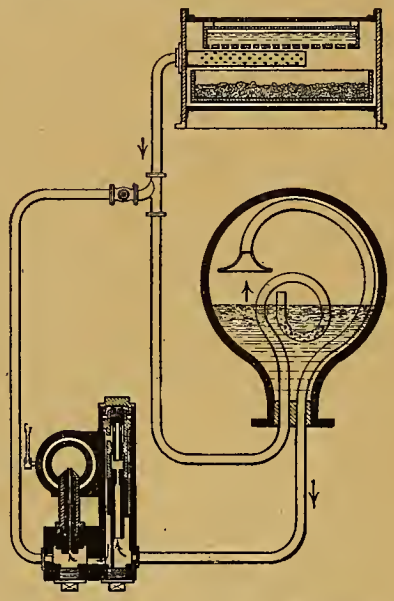


Petersen's device for cutting off the engine when a puncture occurs. No 122,821. 30/1/18.

ignorance that a tyre is deflating gradually, whereas when a tyre deflates suddenly, *i.e.*, bursts, the driver will cut his engine off as quickly and infallibly as any mechanism could do it.

Running on Acetylene Gas.

The price of petrol is evidently felt in Switzerland, as two residents in that country have thought fit to propound a method of running internal combustion engines on acetylene gas, after treatment with ammonia, camphor, and ether; the resultant gas would hardly be cheap in this country. The accompanying sketch depicts their apparatus. The acetylene gas proceeds from the generator at the top down the vertical pipe into the closed chamber on the right. The branch pipe on the left is a more direct path for pure acetylene to be used in starting the engine, and is controlled by the cock shown. The closed chamber contains a bath of an aqueous solution of ammonia, to which small proportions of ether and camphor may advantageously be added. On quitting this chamber the gas is led through the preheating apparatus on the left, which is suitably heated from the engine, either by conduction or exhaust gas and vaporises any liquid present in

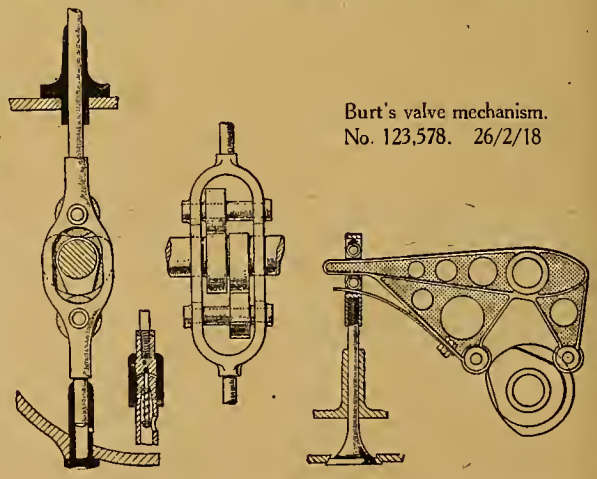


Sieber's method of running an internal combustion engine on acetylene gas No. 125,308. 31/9/18.

the gas. For this purpose the gas is led through a series of fine passages on the right of the apparatus before it is delivered through a feed nozzle into the induction pipe on the left. The arrangement of the preheating chamber forms a safeguard against flashing back.

To Eliminate Valve Springs.

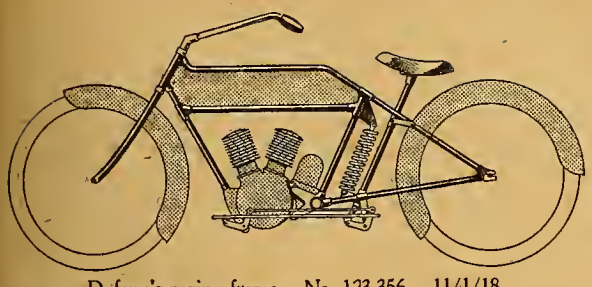
When the war broke out, a pantomime song about "the old Bull and Bush" (which I understand to have been an imaginary hostelry) had not quite passed out of mind. Sundry patriotic motor cyclists immediately nose-dived into the R.F.C., and therein made the acquaintance of the Beardmore aero engine. It was usually their first experience of a power unit with pull-and-push tappets, which both opened and closed the valves positively. So it was promptly re-christened the "bull-and-bush" type. Capt. Burt has now patented a valve mechanism of this character. As shown in the drawings, the system embodies two cams per valve, one to open and one to close. On side valve engines the tappet is slotted, and the cams operate inside the slot; on o.h.v. engines the cams rotate between two rollers mounted on peaks projecting from the underside of a rocker. In each case the last umpteenth of a millimetre in the closing movement is performed by a spring, which may be a flat tongue or a wee coil, as desired. This is necessary, for something would go if the tappet violently hoiked a valve hard against its seat with about an inch of movement still to go: and with so many duffers about you could never be sure that the "bull" action was set to a hair, not to speak of expansion under heat. Such systems aim at eliminating noise, bouncing, and the waste of power involved in compressing very stiff springs 2,000 times per minute. The side valve type shown herewith is too costly and too fiddly for motor cycle engines: I should like to try the o.h.v. pattern some day. But if these patents are valid against other "bull-and-bush" brews which one knows, I should fancy that designers will be able to sidestep quite a lot of previous applications. Patent law is a curious thing.



Burt's valve mechanism. No. 123,578. 26/2/18

A Springing Arrangement.

The Dufaux people of Geneva, who make the M.A.G. engines, are evidently sounder on engines than on frame design. They have patented an idea for retaining the rigid frame and insulating the driver. The drawing is self-explanatory. The saddle and footrests are hung from hinged links and bell cranks, the whole system being suspended from a large coiled spring, as shown. Ten years ago we should have welcomed such a notion, which approximates roughly to the famous Bat spring frame (so-called)—the pioneer of comfortable motor cycling. To-day

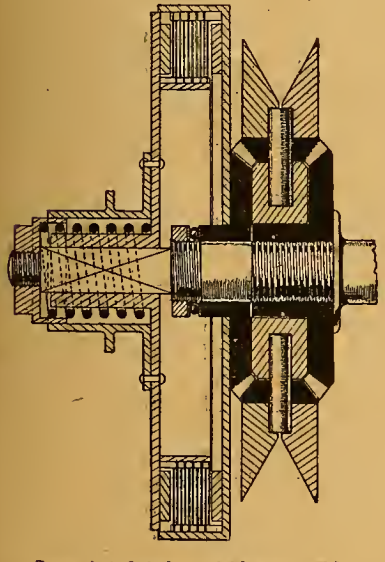


Dufaux's spring frame. No. 123,356. 11/1/18.

we have advanced beyond compromises. Unless we can save a great deal of money or a great deal of weight by skimping matters, we prefer to spring the machine as well as the rider, thereby, for example, ensuring that we shall not arrive at the flapper rendezvous to find that the box of chocolates has slipped its strap on the carrier. Of course, for lightweights and cheap machines there *may* be a future for "hammocking" the rider on a rigid frame; Messrs. Dufaux think so.

Variable Gearing.

Mr. C. H. Strong protects an infinitely variable gear, depicted in the accompanying drawing. It consists primarily of an ordinary differential two-speed gear, affording a solid top gear and a 50% reduction for second gear. The first point of interest is that a belt pulley may be mounted on the differential if so desired. The second is that a multiple disc clutch is mounted between the main-shaft and the inner bevel wheel; consequently, if this clutch be slipped by means of a suitable control, all the ratios intermediate between zero and maximum may be employed. In other words, the gear is equivalent to the old Nala hub, which some of us remember as a reliable but weighty contraption, plus the special advantage that on special occasions, *e.g.*, in a hill-climb, one can call as many ratios as a Zenith clutch model affords.



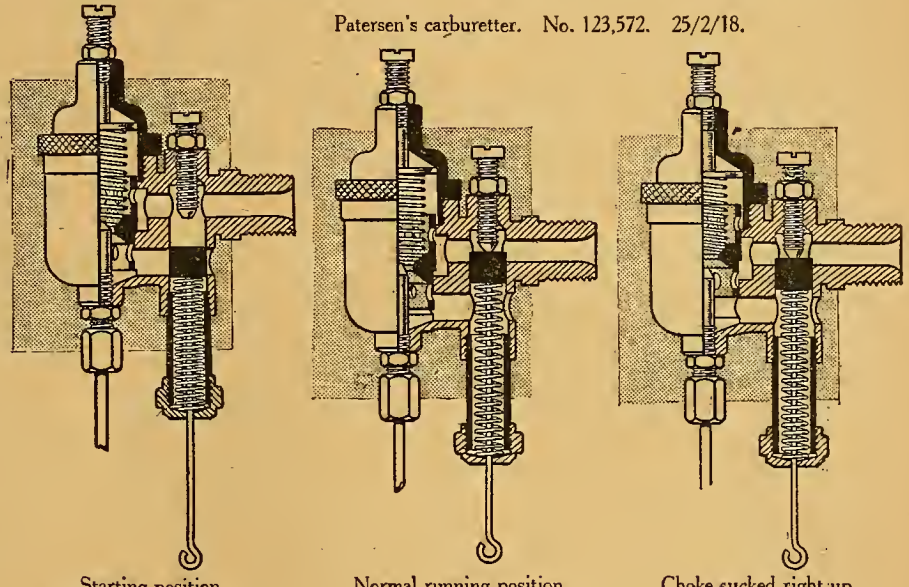
Strong's infinitely variable gear. No. 123,753. 13/12/18.

I will only say that clutch slipping is a dubious method of obtaining extra gears; and that I have yet to meet a clutch which likes being slipped indefinitely. This merit used to be claimed for the famous Hele-Shaw clutch. I have owned a number of them, but the plates had to be in splendid order and bathed in precisely the right amount of the lubricant before clutch slipping made a three-speed gear box infinitely variable uphill.

An Automatic Carburetter.

Mr. Patersen has joined the vast army of carburetter designers, and his suggestions are interesting. The drawings show a very simple carburetter, which has been designed for starting purposes. It should be cheap to make, easily set to a given engine, and automatic in action.

Patersen's carburetter. No. 123,572. 25/2/18.

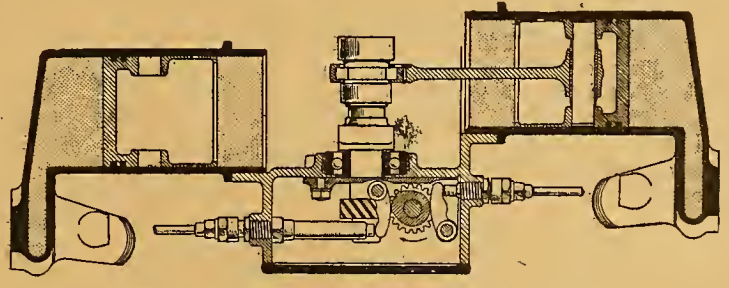


Starting position. Normal running position. Choke sucked right up.

The principles, of course, might be applied to an instrument arranged as the sole gas-supplying apparatus of a motor cycle engine if a float chamber was added and larger passages incorporated. Petrol enters the base of the spraying chamber. Engine suction drags the juice *into* the jet, as well as out of it. The heart of the notion is the floating choke tube, which is normally held down by a spring, and rises in response to engine suction. As the engine speed rises, the choke tube is sucked up, and, owing to the shape of its throat, the suction on the jet is reduced. Indeed, as the sketch shows, if the choke is fully lifted, the engine may be starved; and a great variety of settings are possible. A simple device is incorporated, by which the air ports can be closed by hand, concentrating all the suction on the jet for a moment.

Flat-twin Valve Mechanism.

The sketch at the foot of this page is self-explanatory; it illustrates the particularly neat valve gear adopted for the latest Douglas engine. The vertical camshaft and rockers are mounted on a plate which can be detached from the crank case. Both inlets and both exhausts are respectively operated by a single cam, and study of the sketch will indicate that, althongh the two inlet or the two exhaust tappets are not in the same plane, the arrangement gives identical timing in both cylinders. The valve-lifting mechanism consists of a double-humped cam, floating on the camshaft.



Douglas Motors Ltd., valve gear. No. 127,146. 18/7/18.

EQ

A SINGLE GEAR TEST.

A Plea for the Simple Solo Mount and Sporting Competitions to develop it.

DURING the week of the A.C.U. trials there was naturally much discussion in Llandrindod Wells on the subject of motor cycles and all that appertains thereto. One of the most acutely argued points concerned the flexibility of the modern engine.

Many well-known motor cyclists, especially those whose experience dates from the earlier days of the industry, contend that since the general introduction of gear boxes and variable gear ratios, manufacturers have taken less trouble to provide flexible engines, and consequently the modern engine is not as good as it should be.

Now this is a subject which is capable of almost infinite argument, and there are so many possible points of view that one is apt to lose sight of certain very important points connected with design.

To begin with, it may be argued that the modern high efficiency engine maintains its efficiency largely by reason of high r.p.m., and that a well designed high-speed engine with a wide range of gear ratios is preferable to a comparatively slow speed engine, which will pull a reasonably high gear at low road speed.

This is true to a certain extent, but a very large number of riders (probably the majority) do not care for constant gear changing, and prefer an engine which will do all normal work on top gear, and this is particularly the case with solo riders, who crave for a light machine with the minimum of complication.

The Great Days.

We do not mean to suggest that change speed gears are undesirable; on the contrary, under existing conditions, it would be well for sidecarists to use the gear boxes (for which, by the way, they pay a considerable sum) to a very much greater extent than is usual, but we do suggest that a well-designed engine, fitted to a solo mount with a single gear ratio, should be capable of taking its rider anywhere that he is likely to go in the normal course of events. It is well to remember in this connection that in 1911 W. F. Newsome, on a 3½ h.p. single-geared Triumph, made a clean ascent of Bwlch-y-Groes under unfavourable weather conditions. Here, it is true, is the case of a crack rider on a thoroughly well-tuned machine, but on the other hand not one in a thousand tourists take a hill of this description in a year's riding. It may be added that during the Six Days Trials we saw a first-class ascent of one of the rough and steep observed hills by a somewhat similar machine.

Present-day trials are designed to develop and test the modern motor cycle as a whole, and the conditions imposed tend to encourage high-speed engines with which at least three-speed ratios are desirable. Nothing is done to enhance the pulling power of engines, especially at low speeds. It is probably true that had three and four-speed gear boxes been in vogue in the early days of motoring, engines would not have advanced to their present stage of perfection. It was the single-geared solo mount that brought engines to a very satisfactory state before the passenger machine became possible, and we contend that if the single-geared machine were again brought prominently into open competition, nothing but good would accrue. Therefore, we suggest that a single-gear trial be held some time next year, preferably in a locality allowing motor cyclists from all parts of the kingdom to compete.

We are well aware that there is nothing particularly original in the suggestion. Before the war there was a single gear club, and undoubtedly there is now even greater scope for such a body of sporting riders. There is, however, a feeling among expert riders that in the majority of present-day trials, everything depends upon gear ratios, and that, compared with the trials of a decade ago, very little skill is required. This class of rider—and there are many representing the type—desire to ride in a sporting event in which tune and skill will be the all-important factors.

W. F. Newsome, who in 1911 made the first clean climb of Bwlch-y-Groes. He used a single-speed 3½ Triumph, geared 6½ to 1.

A club promoting such a trial would, we feel sure, be certain of very substantial support, and we should like to see an important club or combination of clubs come forward to organise it. An event of this nature may easily become the most popular event of the year among a very large coterie of solo riders, who have skill enough to pilot a suitable single-gear machine almost anywhere the multi-speed sidecar can go.

A Trial Suggested.

Such a trial would be essentially sporting, but lessons for engine manufacturers would bound to be revealed, and it would also encourage makers of solo machines to develop their products as simple solo mounts.

We are prepared to compile a list of single gear enthusiasts who would enter a sporting trial of the nature outlined above, and invite these motor cyclists to send us their names in order that some approximate idea may be conveyed to energetic clubs who may give the matter consideration. If no clubs care to take up the idea, we would ourselves willingly organise such a trial for private owners.

It should be remembered that the more simple a machine is, the cheaper it will be; consequently, there seems to be no apparent reason why, even at present-day prices of labour and material, a simple solo machine with an engine around the 500 c.c. mark should not be produced for £60 or so.

The Scooter Trial.

The Auto-Cycle Union is so fixing the conditions for the proposed Open Scooter Trial that all types of these little machines will be included.

Single Gears—a Reminiscence.

On page 394 will be found an article which suggests a single gear test as a means further to develop the flexible engine. This proposal brings to mind several good performances on single gear machines. Among these, undoubtedly the most notable was the achievement of Geo. Brough, who, in 1912 and 1913, secured gold medals in the Scottish Six Days Trials on a 6 h.p. single gear Brough, and, what was more, covered 1,000 miles under observation with sealed tool bags. Incidentally, the 1913 Scottish trial included Applecross and Kenmore, upon which hills his gear was only 4½ to 1.

A Mean Trick.

A reader in Manchester, who advertised his machine for sale in the columns of *The Motor Cycle*, has had his mount stolen by a confidence trick. The morning the paper was published a plausible stranger called upon the owner's wife, who was persuaded to allow him to try the machine. Result, a lost 1913 3½ h.p. Triumph, fitted with N.S.U. two-speed gear, Bosch magneto, and Senspray carburetter. We hope other readers may be the means of its recovery. The owner is Mr. J. Todd, 33, Link Avenue, Stretford, Manchester.

Profiteering in Petrol.

A Government Order issued last week brought the price of petrol within the provision of the Profiteering Act. In view of the frequent complaints of overcharging that have reached us, this regulation will be most acceptable. The following are the maximum prices of the various grades of spirit retailed in cans:

	Retail per gallon. s. d.
Aviation	3 4½
No. 1	3 0½
No. 3	2 10½

For delivery to commercial consumers (not for re-sale) in steel barrels, 1d. per gallon less than can price, and for delivery in bulk to commercial consumers (not for re-sale), 1½d. per gallon less than can price.

One penny per gallon to be added to all above prices when sold for delivery in Scotland or Ireland.

Quantities less than a gallon shall be sold at a price proportionate to that charged per gallon.

Where motor spirit is delivered by a retailer to a purchaser at any place other than the retailer's place of business an extra charge at the rate of one penny for a gallon, or for any part of a gallon, may be added to the price.

Motor Journalist Forsakes Pen for Showroom.

Mr. Arthur Gough, the Midland motor cycle journalist, is forsaking the pen and is opening a business at 173, Broad Street, Birmingham, where he will sell motor cycles and most things appertaining thereto. Gough served four years in the Army, and has but recently been demobilised.

Paris-Nice in 1920.

The Paris-Nice trial next year will be held from February 13th to 16th, and will be so arranged that the competitors will arrive at Nice in time for the carnival on Shrove Tuesday. M. Gaston Sweerts, the prime mover in the organisation of the trial, is anxious to see a large party of British competitors, who will be assured of a hearty welcome in France. A hill-climb (quite separate from the Paris-Nice trial) will be held at La Turbie probably on February 19th.

Motor Cycle Experts.

Three more registered competitors are now "qualified" for the expert class under the Auto-Cycle Union's Regulations, these being S. L. Bailey, G. Dance, and W. A. Jacobs.

Special Features.

A SINGLE GEAR TEST. THE OUTLOOK FOR THE INDUSTRY.

Still Growing.

The membership of the Auto-Cycle Union, which is now much greater than at any previous time in its history, and continues rapidly to grow, is convincingly indicative of the increasing popularity of the motor cycle.

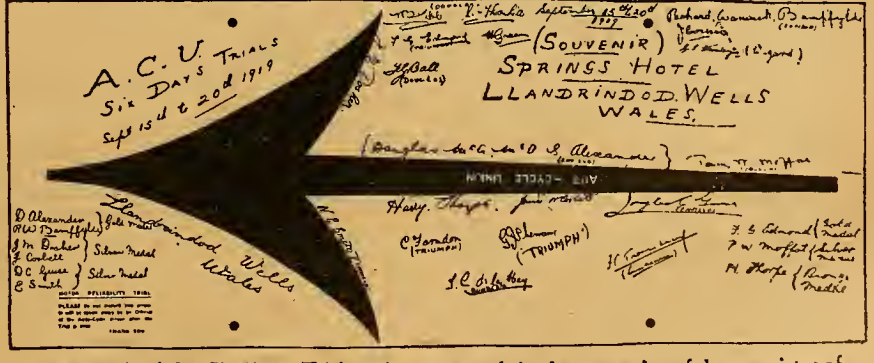
Weights of Machines in A.C.U. Trials.

Great interest has been displayed in the weights of the competing machines in the recent Six Days Trials, published exclusively by *The Motor Cycle* in the issues for September 25th and October 2nd. There was a typographical error in the latter list which quoted D. H. Noble's 5 h.p. twin Rover as a 3½ h.p. machine, but since this rider's mount was correctly referred to throughout the report, few readers could have been led astray.

A Veteran Designer.

Mr. Paul Kelecom, whose name is well known to motor cyclists, and especially to the old brigade, was an interested spectator of the A.C.U. Six Days Trial. His views on the future of motor cycles are interesting, especially as he now holds a prominent position in the F.N. concern.

We learn that a new four-cylinder, modelled on the 7 h.p. F.N., is to be produced by the company concerned. Mr. Kelecom was particularly impressed by the running of British flat twins and by the performance of a certain little two-stroke. He expressed the opinion that the future sidecar motor cycle will be engined with a four-cylinder, and that the flat twin will provide the motive power for solo mounts.



A souvenir of the Six Days Trials. An arrow card, in the possession of the proprietor of the Springs Hotel, Llandrindod Wells, which bears the signatures of many successful competitors who made the hotel their headquarters.

Scott Trial and Petrol Scarcity.

In view of the petrol shortage, incidental to the railway strike, much praise is due to Mr. Dovener, of the Scott Co., in arranging for a supply of 100 gallons of spirit at the conclusion of the Scott Sporting Trial.

Midland Palmer Cup Trial.

The South Birmingham M.C.C. announce particulars of their open trial on November 1st, which will be held over a course approximately 150 miles in the Midlands. The prizes will be decided on the results of a series of tests, for which marks will be awarded, deductions being made for failures on a brake test, easy starting, and stopping and restarting. The object is to find a winner on the machines' merit, as different from sorting out by secret time checks and speed-judging. Mr. S. Kempson Jones, 93, John Bright Street, Birmingham, is the organising secretary. Entries close on the 24th.

Standardisation of Chains.

Good progress has been made in the direction of standardisation by the members of the Association of British Driving Chain Manufacturers. Narrow and wide chains, $\frac{3}{8}$in., $\frac{1}{2}$in., $\frac{5}{8}$in., and $\frac{3}{4}$in. pitch, have been standardised, which will be available early in December, meanwhile, any difficulty in changing over to the new standards will be obviated by the temporary adoption of certain tooth widths which will accommodate existing sizes of chains as well as the new association standards. Particulars are obtainable from the Secretary of the Association of British Chain Manufacturers, Bassishaw House, Basinghall Street, London, E.C.2.

Of Interest to Aspiring Engineers.

The London County Council offers numerous scholarships to boys who intend to enter the skilled trades. There are scholarships for carriage and motor body building at the Regent Street Polytechnic, and for engineering and the allied trades at the L.C.C. Hackney Institute, the L.C.C. Paddington Technical Institute, the L.C.C. School of Engineering and Navigation, Poplar, and the Woolwich Polytechnic, Woolwich. Application should be made to Mr. R. Blair, Education Officer, L.C.C. Education Offices, Victoria Embankment, London, W.C.2.

Motor Cycle Permits for Ireland.

The R.A.C. draw attention to the fact that a Military Order is in force in Ireland applying to the whole of Ireland forbidding having, keeping, or using a motor cycle by any person other than a member of His Majesty's Forces, or police constable, without a permit from the Competent Naval and Military Authorities, or from the Chief Officer of Police in the district in which the person resides. Motor cyclists taking machines to Ireland must approach the police authorities in the district in which they reside in England in advance, stating that they intend to take a motor cycle to Ireland *via* a certain Irish port and request the police authorities to write to the Chief of Police of the port of disembarkation in Ireland, in order that the traveller on reporting to the Chief of Police at the port of arrival in Ireland may obtain the necessary permit.

IMPORTANT DATES.

Paris Salon	Oct. 9th to 19th.
Athens Motor Show	Oct. 13th to Nov. 14th.
Olympia Car Show	Nov. 7th to 15th.
Olympia Motor Cycle Show,	Nov. 24th to 29th.
Brussels Show	Dec. 8th to 13th.
Paris Aero Exhibition	Dec. 19th to Jan. 4th.
New York Show	Jan. 3rd to Jan. 10th.
Birmingham British Industries Fair	Feb. 23rd to March 6th.

La Cote de Gaillon

The Motor Cycle Club of France are holding a hill-climb at Gaillon, on the road from Paris to Rouen, at the end of October. The Côte de Gaillon has been practically an annual event with French organisers, and usually attracted a large number of entries.

A Famous Single Gear Exponent.

The other day we were delighted to meet W. F. Newsome near the Triumph works in Coventry. Latterly, "Billy" Newsome has been in the army, and has had many outlets for his activity and motor knowledge, having been at various times during his military career a motor cycle mechanic and tester, and a car tester, although he was mostly in charge of motor cycle engine overhauling at one of the large M.T. depôts. Talking of mutual army experiences led us to gossip of the old days when speed gears were not, and apropos of Bwlch-y-Groes in the recent Six Days, Newsome told us that he still cherished a silver-framed photograph of the hill presented to him by local riders. This was in commemoration of the first "official" climb of the hill he accomplished on a fixed gear Triumph in 1911. We hope that now he is demobilised, the name of W. F. Newsome will again appear amongst those of the regular supporters of motor cycle competitions.

Lighting Regulations.

Owing to the railway strike some of the lighting regulations which were in force under D.O.R.A. have been re-imposed. This means that lighting-up time is half-an-hour after sunset, that motor cars, horse-driven vehicles, sidecars, and cycle cars, must carry two lights in front, that hand carts must again be lighted, and that all vehicles, including bicycles, must display a red light in the rear. In the case of hand carts, a single lamp showing a white light to the front and a red light to the rear will be deemed sufficient.

208 Exhibitors at Olympia.

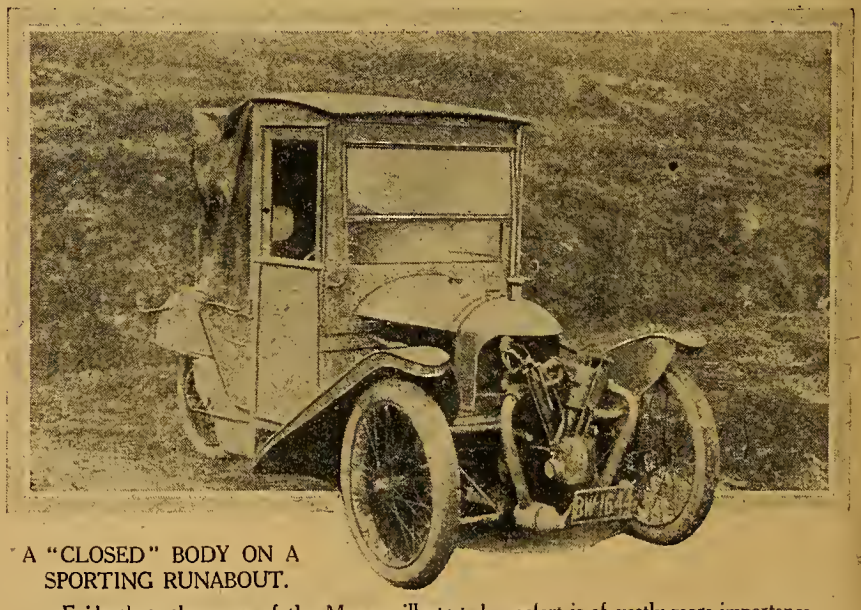
Up to the time of going to press, the list of exhibitors at the Olympia Motor Cycle Show (November 24th to 29th) number 208.

The Rear Light Question.

Recently a woman was killed through a collision with a motor car while cycling at night. At the inquest at Grimsby, the coroner said he did not think the accident would have occurred if her cycle had had a rear light, and the jury asked him to write to the Home Office with a view to the rear red light regulation being reinstated. It is exceedingly pleasant to see that some coroners take a very sensible view of the rear red light question. A red rear light again became compulsory on October 1st.

Honour to whom Honour!

A competitor in the recent Scott trial writes us: "Will you thank the Scott people for their generosity and for the highly sporting spirit that characterised the whole event? I learn with much regret that no vote of thanks was proposed at the presenting of the cups, though I am sure the appreciation of all of us was most genuine. Few of us ever remember a more enjoyable and sporting trial."



A "CLOSED" BODY ON A SPORTING RUNABOUT.

Evidently to the owner of the Morgan illustrated, comfort is of vastly more importance than appearance. The association of a coupé body with a vehicle admittedly one of the most "sporting" on the road is decidedly incongruous. This little hybrid was seen at the Six Days Trials at a lonely spot on the Welsh moors.

IMPRESSIONS OF THE SCOTT TRIAL.

Random Jottings by our Representative who observed the Event and journeyed by Road to Coventry the same Night. Being thus independent of Railways and Telegraphs we were enabled Last Week to publish an Exclusive Illustrated Report.

THE object of the Scott Sporting Trial was largely to gather together a crowd of sporting riders on a course of such difficulty that only the brave and the lucky should survive it. The habitual competition riders of the "split-second" type were not catered for; they were welcome, but the spirit of the day called upon them to forget all except the fact they had to get round. Their frames might be broken in the attempt—well! No complaints or "strikes owing to the severity of the course" could be entertained, for the trial was indeed on the lines of the survival of the fittest.

Everyone was imbued with the sporting spirit, so that when one man broke his frame, he cheerfully patched it up with bootlaces and string and struggled to the end in the brightest humour. A second man promptly retired in order to assist a third competitor who was involved in a collision, and so on throughout the day; the usual business of "pot-hunting" was forgotten in a joyous trek across the mountain tops.

The course was so utterly bad that no one was expected to exceed the schedule speed of 17 m.p.h., and, in consequence, no marks were deducted for being ahead of time. "Go as you please" was the order of the day, and the man who accomplished the best time handsomely beat the schedule average by adhering to the injunction. This rider was Geoffrey Hill, mounted on a 4 h.p. Triumph, and his performance was an eye-opener, especially to some of the Scott boys, who ran him very closely.

One man is reported to have dashed straight through a closed gate at the foot of a precipitous descent. The rotten and weather-beaten timber flew in all directions, and, as the rider's balance was not upset, he carried on without loss of time, and the gap he left behind was much appreciated by those who followed!

Several Six Day competitors and a host of North-country sportsmen took part, and the Scott Co. hope that a larger entry than ever will be forthcoming next year; they, on their part, promise to find a still more difficult course.

Every praise is due to Capt. Vinter and Mr. Dovener of the Scott Co. for the splendid organisation, arrowing of the course, and the liberal "replenishments" available for men and machines at the lunch and tea stops.

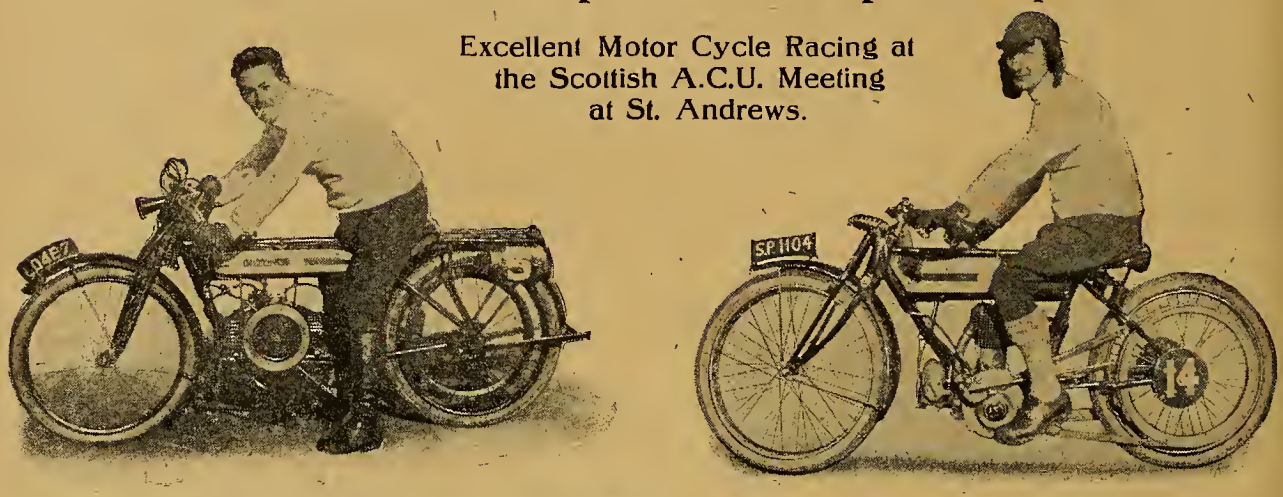
At the conclusion of the trial, several of the competitors attempted to cross the River Wharfe at Burnsall, and fitted rubber extensions to the air-intake and silencer outlet, carrying them to the level of the handle-bars and carrier respectively. Thus equipped Capt. C. P. Wood, after several fruitless attempts ending with his own Scott becoming water-logged in four feet of water, succeeded in finding a passage not deeper than the top of the wheels. Borrowing Wills's 5-6 h.p. James, he successfully crossed the river and returned.

Tim Wood, who ran fourth for the Trade Cup, and is thoroughly at home amongst the Yorkshire byways, made one complaint: "Too much main road." There were about sixteen miles out of the eighty-two!

INCIDENTS OF THE SCOTT TRIAL. J. E. Walker (3½ h.p. Scott), followed by H. W. Sellers on a similar machine, near Blubberhouses. (Right) G. Wray (4 h.p. Triumph) on Pock Stones Moor, where the road was merely a treacherous pathway of damp moss.

The Scottish Speed Championships.

Excellent Motor Cycle Racing at the Scottish A.C.U. Meeting at St. Andrews.



Two Scottish Championship holders: D. S. Alexander (2¾ Douglas), the Scottish lightweight champion, whose time was 30 minutes for the twenty miles, and G. W. Glen (4 Triumph), the mediumweight speed championship winner.

DESPITE the dislocation of postal and railway service caused by the strike, we were able last week to give an exclusive report of the results. Further particulars of this most important speed contest of the Scottish motor cycle year are now available.

Ideal weather favoured the event, and, except at one of the turns, the sands were in excellent condition, and favoured fast times. The course was straight, with a turn at each end, the complete lap being approximately two miles.

The event included fourteen classes, but, owing to lack of entries, two of these, Class 12 and Class 14, had to be abandoned.

The Championship Classes.

Chief interest centred in the three championship events as follows: Class 1 (open), Scottish lightweight speed championship; Class 2 (open), Scottish mediumweight speed championship; and Class 3, Scottish heavyweight speed championship. The distance in each case was ten laps, approximately twenty miles.

In the first class there were five starters, and one or two of the riders had trouble very early. A. L. Downie on a 2¾ h.p. A.J.S. had a stretched inlet valve, and immediately after broke a crank pin.

The brothers D. S. and A. H. Alexander took the lead early on, and, barring accidents, the event rested with one of these riders. D. S. Alexander (2¾ Douglas) was leading at the end of the first lap, but his brother, "A.H.," also on a Douglas, took the lead, going very strongly, J. R. Alexander (2¾ Douglas) and A. E. Wills (2¾ Douglas) following in the order given. Just when the event appeared his, A. H. Alexander gave up after a good race, and D. S. Alexander won easily, J. R. Alexander being second, and A. E. Wills third. Winner's time, 30m.

Some of the best riding of the day was seen in Class 2. The event produced eleven entrants and nine starters, the non-starters being J. Emerson (3 A.B.C.) and R. J. Braid (3½ Beaumont). Hugh Mason, the winner of the lightweight championship in 1914, was very much fancied on his 3½ h.p. N.U.T., but his luck was out and a broken crank pin put an early stop to his chances.

A. H. Alexander (3½ Douglas) was again well to the fore, and seemed to have an excellent chance of winning when a valve cap blowing off put him out of the race. The finest performance of this event, if not of the afternoon, was that of G. W. Glen (3½ Triumph). This local rider had a very speedy mount and knew how to handle it. His riding was greatly admired, and his cornering was one of the features of the afternoon. After the retirement of A. H. Alexander, Glen had things his own way, and keeping a fine average speed won easily, his time being 26m. 15s. Towards the finish his engine seized slightly, and he got off, but mounting again finished in the time given. J. R. Alexander (3½ Matchless), was unfortunate; his first trouble was in connection with the drip feed, the needle valve indicator falling out; with the aid of an ordinary pencil he kept going until gear trouble caused him to retire. The final placing was—(1) G. W. Glen (3½ Triumph), (2) Capt. A. Lindsay (3½ Norton), and (3) O. G. Braid (3½ Norton). Glen's time was two minutes faster than that of the second man.

Bad Luck Amongst the Heavies.

In the Heavy Class, seven riders started, but T. Stewart (8 Chater-Jap) could not get his machine started and retired. A. H. Alexander (7 Indian) was again unfortunate. He was leading at the end of four laps, when coming round past the judges for the fifth time, he threw a plug amongst the crowd, and made a brave show on one cylinder. He naturally failed to finish among the leaders.

D. M. Brash (7 Harley-Davidson) stopped and changed a plug, while A. T. Brash had a nasty fall through his exhaust pipe working loose and locking his back wheel. F. W. Dixon (7 Indian), who had been riding well all through, proved to be the winner, his time being 22m.

Several exciting finishes were witnessed in the shorter races. Glen (3½ Triumph) repeated his success in Class 5, confined to private owners; C. Duncan (3½ Norton) was second.

The Edinburgh Club easily won the team race, their team consisting of Geo. Grinton (7 Harley-Davidson), A. J. C. Lindsay (3½ Rover), and A. H. Alexander (7 Indian). The last-named made the fastest time of the day during this event.

An Aluminium Sidecar Body with Screwed & Welded Joints.

MANY new designs, both in the chassis and body construction of sidecars, have appeared amongst the post-war models, notable amongst them being the recent use of metal in preference to three-ply wood, which is usually employed. Many sidecars, the bodywork of which consists of sheet steel or aluminium, have been marketed from time to time; now we hear that a smart looking car, having a sheet aluminium body chemically treated in order to form a matt surface, will, at no distant date, be placed on the market by Messrs. The Gracemill Sidecar Manufacturing Co., High Street, Epsom.

The skeleton framework is made throughout of bent ash, the semi-circular side members being dovetailed into the wide footboard and the wooden top rail respectively, the whole forming a rigid frame to carry the aluminium plates which are screwed thereto, the joints in which are substantially welded so as to form a seamless and symmetrical surface.

Accommodation for tools and spares is provided under the fully-upholstered seat and in the nose of the body, access to the latter being effected by opening the hinged footrest, which is retained in position by engaging a wooden tongue, fixed thereto, with a slot in the framework.

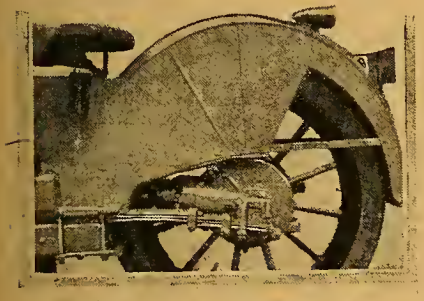
A safety step, situated between the rear wheel of the motor cycle and the sidecar body, is provided, in order that the passenger, when entering the car, shall not be exposed to the passing traffic.

A Motor Cycle on Car Lines.

The American Militor, a Machine embodying a Four-cylinder Engine, Three Speeds and Reverse, Shaft Drive and Spring Frame.

ACCORDING to car designers, the motor cycle eventually will follow car lines, inasmuch as four-cylinder engines, shaft drive and spring frames are concerned. How far these prophets are correct only time can prove, but, so far, where drastic departures have been made on motor cycles, such machines have been regarded as freaks and have failed to appeal to public fancy.

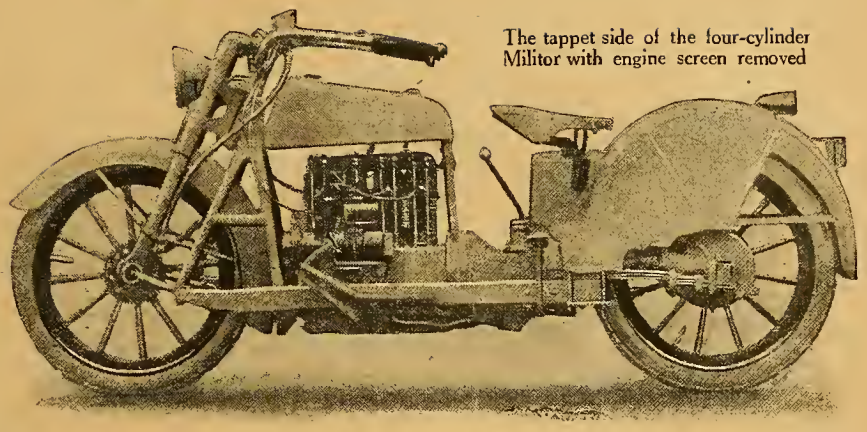
Among these novel machines the American Militaire probably takes first place. Although little has been heard



The system of rear springing, it will be observed, is on car principles.

of this unique motor cycle of late, it seems that experiments have been proceeding, and it now reappears on the American market under the name of Militor.

It will be seen from the illustrations that the new model is distinctly in the "heavy" class. The four-cylinder engine has a bore and stroke of 63 and 89 mm. respectively, giving a total capacity of 1,568 c.c.—far and away the largest engine fitted as the standard power unit of a motor cycle. This engine is air-cooled with overhead valves and mechanical lubrication by a gear pump. The gear box is integral with the crank case and is centrally controlled as on most American cars.

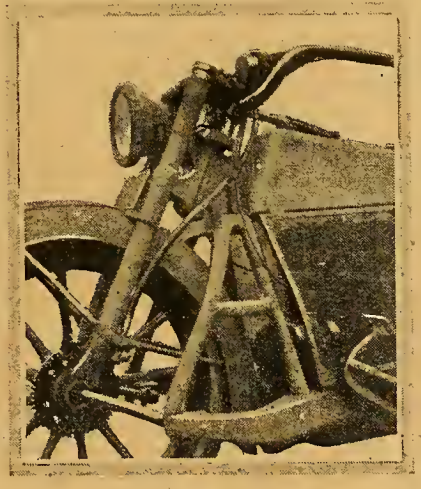


The tappet side of the four-cylinder Militor with engine screen removed

From the engine power is transmitted through a plate clutch and gearing to the shaft and bevels. The electrical installation includes a combined lighting and ignition set, which is carried on the side of the crank case. Artillery type wood wheels are employed both on the machine and on the special sidecar which is supplied when required.

Pressed Steel Frame.

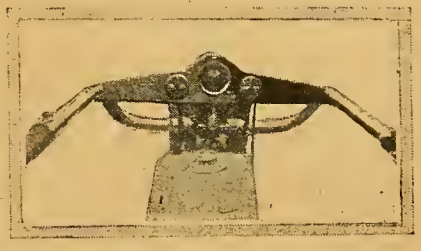
Undoubtedly the most interesting feature of the Militor is the pressed steel frame, which consists of two side members connected at the front by a triangulated "pyramid" supporting the steering head. The front fork tubes are carried up above the steering head and embody two heavy coil springs. In addition, the hub is connected to the front ends of the frame by a patented system which, it is claimed, will absorb head-on shocks of enormous pressure.



Showing spring fork and steering head.

At the rear the frame is sprung on three leaf laminated springs, with an additional supporting leaf on the rear under side.

The tank is supported at the front on a lug on the head stamping, and at the rear, on a loop member carried on the clutch casing of the engine-gear unit.



A unique feature is the handle-bar instrument board.

The capacity of this tank is 3½ gallons, while 1½ gallons of oil are carried in a second tank which is integral with the rear mudguard.

28×3in. tyres are used, which, with the footboards arranged on the frame level, give a somewhat high riding position. An instrument board is carried on the handle-bars.

In July of this year, Lieut. A. Chapple covered two miles in 1m. 18⅖s. at the Sheepshead Bay Speedway, U.S.A., which is a speed of nearly 92 m.p.h.

The price of this unique machine in America, with sidecar, is £120, or as a solo machine with idler wheels, the price is approximately £96.

OFFICIAL MARKS IN THE SCOTT TRIAL.

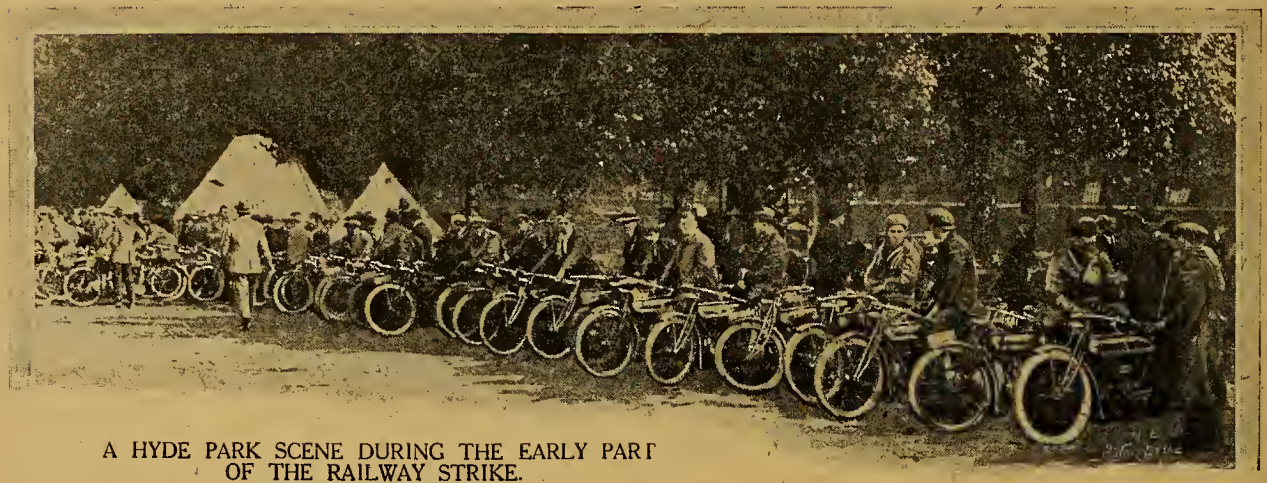
THE awards in the Scott Sporting Trial were given in the last issue of *The Motor Cycle*. The total marks of those competitors who finished the course are of interest, and are here given:

Geoffrey Hill (4 Triumph)	137
W. Leslie Guy (3¾ Scott)	126
W. E. Grange (6 A.J.S.)	121
H. O. Wood (3¾ Scott)	116
H. Langman (3¾ Scott)	99
W. Townsend (3½ P. and M.)	99
J. E. Walker (3¾ Scott)	97
W. Westwood (4 Triumph)	96
H. Mortimer Batten (3½ P. and M.)	95
W. Drake (3½ P. and M.)	95
H. W. Sellers (3¾ Scott)	94
T. Hargreaves (3¾ Scott)	90
W. Moore (3¾ Scott)	89
Capt. Hardy (4 Triumph)	88
Jesse Baker (3¾ Scott)	88
J. W. Wills (5-6 James)	86
B. Dewhirst (4 Triumph)	81
G. C. Ecroyd (4 Triumph)	80
J. Dosher (8 Enfield)	72
J. Duxbury (4 Trinmph)	72
H. Hill (3¾ Scott)	64
Walter Smith (3¾ Scott)	63
E. Wilkes (3¾ Scott)	52
W. Clough (3¾ Scott)	50
W. Atkinson (4 Triumph)	44
C. Froggatt (3¾ Scott)	37
Geo. Wray (4 Triumph)	32
Bentley Rigg (3¾ Scott)	27
—. Atkinson (Bat)	27
Donald Moore (3¾ Scott)	23
E. Washing (2¾ Coulson B)	17
E. C. Bean (2¾ Douglas)	16
Chas. Hart (3½ P. and M.)	15
G. R. Hardaker (3¾ Scott)	— 58
G. A. Reed (2¾ Coulson B)	— 60

G. Walker (4 Triumph) retired in order to assist Stanley Ashby (3¾ Scott), who collided with a car. Eighteen others started but failed to complete the course

PETROL AND THE STRIKE.

The Internal Combustion Engine proves its Value in a Peace Crisis as in War.



A HYDE PARK SCENE DURING THE EARLY PART OF THE RAILWAY STRIKE.

Hundreds of motor cyclists volunteered their services immediately the Government made their appeal. The photograph depicts despatch riders ready to depart at a moment's notice.

JUST as the internal combustion engine was an important factor in the winning of the war, so has it proved the salvation of the country when threatened with starvation through the strike of the railway workers. As during the period of the war, motorists came forward in their thousands to assist the Government in maintaining the nation's food supply, with the result that every type of motor vehicle—from the motor cycle to the 5 ton lorry—was pressed into service. The number of volunteers for service as drivers probably exceeded the call when the nation went to war, for the sole reason that the great part played by the motor during the war has brought into being increased numbers of those who are accustomed to the steering wheel.

On every main road in the kingdom there was evidence of the railway stoppage in the large amount of motor traffic passing in both directions. Had the strike taken place before the war, the whole country would have been paralysed. As it was, the reverse seemed to be the case. It was as if Great Britain had awakened. Instead of an atmosphere of uncertainty, and a general slowing down of the nation as a whole, which certainly would have been apparent had all transport come to a standstill, the activity on the roads gave one the impression that there was a general speeding up, that instead of the "jog-trot," with which English people are sometimes supposed to travel through life, the country had "opened the throttle," as it were—and, what was more, seemed to enjoy it.

Then and Now.

The traffic in London, particularly, was almost appalling, especially in the main thoroughfares. About thirty years ago the then Vicar of London Colney (that small village on the Holyhead Road about three miles south of St. Albans) said he remembered the time when as many as eighty coaches a day passed through on their way to Birmingham and the North-west. Had the old cleric lived to the present time, he would have seen the activities of the road restored to their pristine condition. The four-horse coaches of his time were, however, replaced by towering 5 ton lorries, some bearing marks identifying them with the late war, and every other form of motor vehicle engaged upon the great work of feeding a nation threatened with calamity. Despatch riders once more became common objects of the countryside, and the economy of the motor cycle was forced upon everyone's notice every time an overloaded sidecar passed bearing a contingent of City workers to their duties at a cost in fuel of approximately 9d. per person for fifty miles.

As was to be expected, perhaps, the petrol profiteer made an early appearance, demanding as much as £1 per tin of fuel, but the Government quickly put a stop to this practice by including motor spirit in the schedule provided by the recent Profiteering Act.

Along the main roads long-distance chars-à-bancs were to be frequently seen, bearing such inscriptions as "London-Blackpool Express," while lorries laden with human loads became a common sight. All military movements had to be accomplished by motor transport. People who usually used the train between their homes and their work occupied the seats on motor 'buses, and any other type of vehicle capable of accommodating them. It became a recognised rule amongst motorists that an empty seat was something of which to be ashamed.

Apart from the question of food supplies, a great deal of raw material has been carried, thus reducing the chances of unemployment in the main industries. Upon the question of quick delivery depends the employment of labour in many fields. As an example, the large staff at the printing works of our publishers depend upon the many journals which they print being distributed. Without a means of doing this, the publication of any papers would be futile.

As in all previous national crises, motor cyclists came forward in large numbers to assist the Government. The photograph shows lines of private machines placed at the disposal of the Ministry of Food.

Everything was done to ensure motor cyclists and motorists obtaining their copies of *The Motor Cycle* and *The Autocar*, and in case passing drivers from outlying districts had been unable to obtain the papers, emergency bookstalls were installed on the roadside at various points on the chief main roads. Such instances are, of course, only incidental, but serve to demonstrate the value of road transport under all conditions.

The first emergency bookstall was established at Shirley's Garage, Meriden, on the London-Holyhead road, in the popularly recognised centre of England.

In the newspaper world no time can be lost in lengthy deliberation. Immediately the strike was declared several additional lorry chassis were acquired for the transport department. In the meantime came many offers of assistance from car manufacturers in Coventry, who placed at our disposal a fleet of cars for service between the capital and Coventry. In addition, readers we had never seen before offered assistance with their sidecars, and the staff found time, between their other duties, to run in twenty-mile trips with loads of 2 cwt.

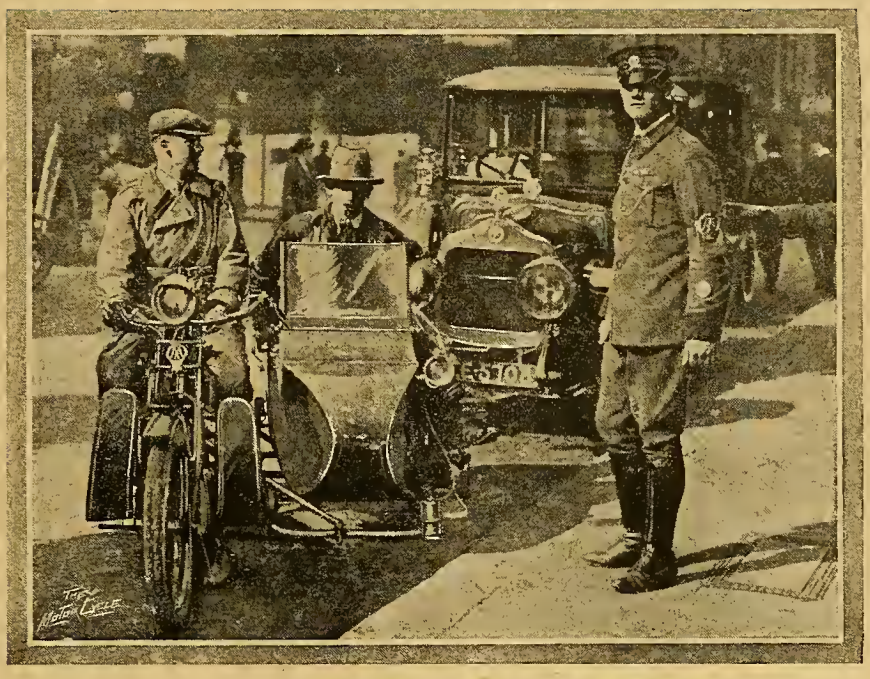
The two Triumph sidecars undergoing the A.A. benzole test were put to practical use. Instead of the tour arranged for the second half of the test these two machines, still under A.A. observation, formed a valuable daily mail service between London and Coventry, carrying important letters and small parcels, starting each day at noon from *The Motor Cycle* offices at Coventry and the A.A. benzole depôt on the outskirts of London, one machine passing the other each day midway between the two points with the utmost regularity.

London Traffic.

The traffic in London was appalling, especially in the main thoroughfares, and one morning we had an exciting time with a single-cylinder sidecar outfit, the clutch of which was out of action.

On the Country Roads.

Naturally every form of motor vehicle was encountered. During two journeys, amounting to about 170 miles in all, we do not recollect a single instance of joy-riding. Everyone appeared to be bent on serious business. A few people were obviously motoring home from places where they had been stranded by the strike, and most of the vehicles were conveying food or household goods. The worst thing to overtake was a lorry laden with empty milk cans. We followed one for miles, and then beckoned a six-cylinder Sunbeam to take our place and use his Klaxon. He did not hesitate to do the former, but omitted to use the horn for quite a long time Few people possess warning signals which can be heard above the din these milk lorries make.



A volunteer despatch rider arriving at the A.A. headquarters.

There were, alas, plenty of instances of bad driving, and it behoved every road user to exercise the utmost care and consideration. The food lorry held sway, and rightly so, but its driver should have hugged the near side, and let the swifter cars and motor bicycles have a chance of passing. The most common infringement of road law is failure to recognise that the man on the near side has the right of way, and if a motor cyclist overtaking a lorry sees another about to pass in the opposite direction, he should slow down and leave him a free passage. In a run of seventy miles we saw at least four results of accidents —all lorries. Of these, one was clearly due to defective lamps, as the vehicle had left the road and had charged the off side hedge.

"The Motor Cycle" delivered by Road.

Travelling south from the Midlands on a *Motor Cycle* lorry, we were given many cheers from passing motor cyclists.

The Empty Sidecar.

We felt particularly uncomfortable whenever we were compelled to travel up to the City with an empty sidecar.

Troubles by the Wayside

There were plenty of minor breakdowns to be seen on the roads, but few motor cyclists were seen stranded.

Our Mounts.

On the first day of the strike, copy for *The Motor Cycle* was taken down to the printing works by a member of the staff on his 2¾ h.p. Douglas. One of the photographic staff used his 8 h.p. Matchless, and an editorial representative travelled up to Town on one of the latest P. and M. sidecar outfits. Later, a 1919 4 h.p. Triumph with sidecar was pressed into service. On local duties were A.J.S., Ariel, Norton, and Enfield sidecars.

The two Triumph sidecars undergoing the A.A. 5,000 miles benzole test were put to good service when the engines had been decarbonised after covering 2,400 miles. The animated scene is at the Coventry offices of *The Motor Cycle*, where the London mail was handed to the riders, who maintained a regular service.

FROM THE PRINTERS TO THE PUBLIC.

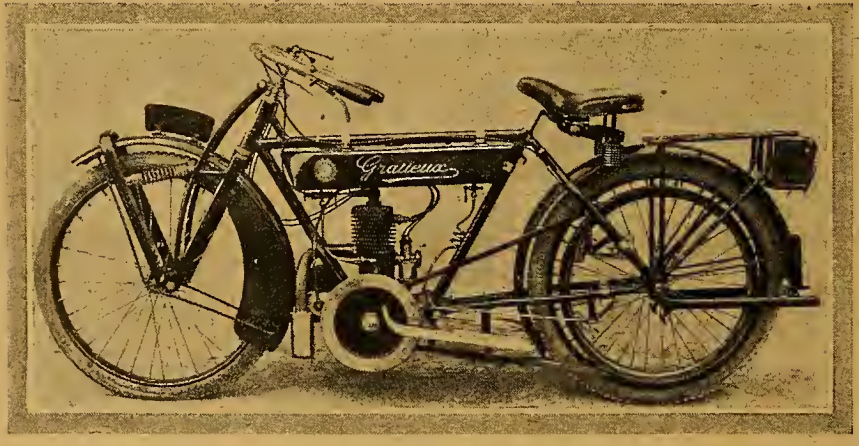
One of *The Motor Cycle* lorries distributing last week's issue during the railway strike The lower picture shows one of the emergency bookstalls placed on the main roads by our publishers.

A New French Two-stroke Lightweight.

THE fact that France is making rapid strides in motor cycle construction is emphasised by the advent of several new machines, amongst which the Gratieux two-stroke compares favourably with English productions. This machine is of entirely French construction, being built in the factories of F. Gratieux at Billancourt, a firm which gained a reputation during the war for its aeronautical productions. The motor is a three-port two-stroke, and is said to be economical in running and very well balanced. The lubrication is automatic, and can be regulated by a milled head. Two brakes are provided, both acting on the belt rim, and it will be noted that the aluminium footboards are placed unusually far back.

Maximum speed is about 38 m.p.h.; weight just over 120 lb.; and tank capacity four and a half litres (one gallon) petrol and one and a half litres oil.

The price fixed is 2,100 frs., equalling roughly £84 purchasing power, and delivery is promised within fifteen days. A striking feature lies in the unusual type of spring forks, the design of which is clearly illustrated. They should be equal to the road conditions in France, which in places are reported by demobilised despatch riders to be very bad. The Gratieux is only one of many interesting machines which have been produced in France since the Armistice.



The Gratieux two-stroke, a French lightweight weighing 120 lb. and selling at £84.

A French "Reliability Trial."

COMPARED with the average British trial, the recent "Grande Ceinture" was not at all a strenuous affair, except for road surfaces, which, on the whole, were very bad. Starting from one of the suburbs of Paris, the sixty competitors were required to make a 125-miles circuit of the city at an average speed of 18⅜ m.p.h.

All the riders enumerated in the table below obtained full marks for running to schedule, their final positions being determined by comparison of their total times in the two speed hill-climbs included.

250 C.C. CLASS.—1, Louis (Alcyon); 2, Dubost (Moto-Solo); 3, Reservat (Gratieux).

350 C.C. CLASS.—1, Vulliamy (Alcyon); 2, Colombel (Douglas); 3, Rigal (Motosacoche); 4, Gordon Wren (Coventry Eagle); 5, Isoldy (Douglas); 6, W. Davis (Douglas).

500 C.C. CLASS.—1, Joly (Alcyon); 2, Barthelmy (Rover); 3, Geoffrey (Rudge Multi).

750 C.C. CLASS.—1, Gompertz (Triumph); 2, Favart (Douglas); 3, Pinney (Triumph); 4, Duverne (Douglas); 5, H Nass (Sunbeam); 6, Suriray (——).

SIDECARS, 500 C.C. CLASS.—1, Gallié (Triumph); 2, Psalty (Rover); 3, Riant (Rover).

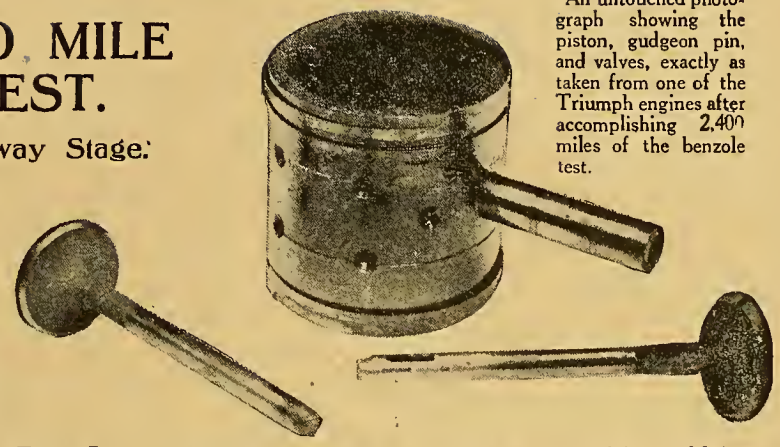
SIDECARS, 750 C.C. CLASS.—1, Lacour (G.L.); 2, Delabre (Rover); 3, Moret (G.L.); 4, Herbert (Sunbeam).

CYCLE CARS, 1,100 C.C. CLASS.—1, Noel (Noel); 2, Enders Jack (Enders Jack); 3, Mahieux (Bedelia); 4, Binet (Bedelia).

The cups awarded to the best equipped machines were won by the G.L. team, and by Mahieux on the Bedelia cycle car.

THE A.A. 5,000 MILE BENZOLE TEST.

Engine Examination at Half-way Stage.



An untouched photograph showing the piston, gudgeon pin, and valves, exactly as taken from one of the Triumph engines after accomplishing 2,400 miles of the benzole test.

AT the conclusion of something over 2,400 miles, the Triumph sidecar outfit, on which the A.A. benzole test is being carried out, arrived in Coventry once again.

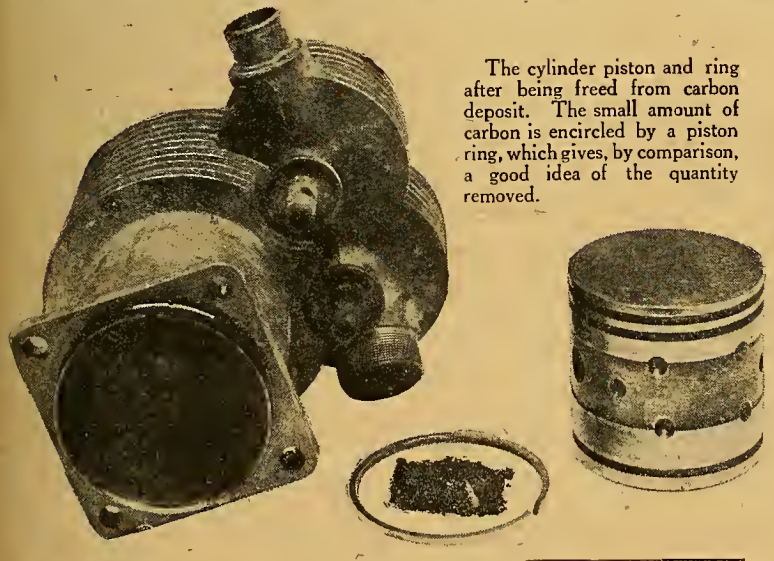
As mentioned in our last issue, the engine was stripped for examination at the Triumph works under expert observation, which included representatives of the Triumph Co., Mr. Smith, of the A.A., Mr. Robert S. Fox, M.A., A.M.I.A.E., M.J.I.E., A.F.Aer.I. (the observer appointed by the I.A.E.), and ourselves.

No engine trouble had been experienced up to the time of inspection, with the exception of a stretched exhaust valve due to the high average speeds maintained throughout the trip.

On the removal of the cylinder, it was immediately obvious that there was a much smaller quantity of carbon deposit than the circumstances warranted. In fact, the estimates of the observers varied from half to a quarter of the amount of carbon usually present after the same distance on petrol.

All carbon was carefully scraped off the piston, cylinder head, rings, and valves and collected together in a small heap. The process was particularly easy, as the deposit was so soft that most of it could have been removed by wiping with a rag. It was intended that the carbon should be weighed, but the total quantity was so small that it was decided that photographic evidence would be sufficient.

It should be mentioned that the piston showed slight signs of seizure, and the top ring was slightly stuck in its groove. This, of course, would tend to increase carbon deposit, but, as far as could be ascertained, the trouble was in no way due to the use of benzole as a fuel, but rather to the gruelling test to which the machine had been placed. The same cause was probably responsible for the fact that the exhaust valve was rather burned and scaled, though otherwise the engine was in perfect condition. Mr. Fox at any rate stated that in his opinion the state of the valve was due to overdriving, and not to the effect of the fuel.



The cylinder piston and ring after being freed from carbon deposit. The small amount of carbon is encircled by a piston ring, which gives, by comparison, a good idea of the quantity removed.

Two samples of the oil in the base chamber have already been taken, and two more will be taken, and it is expected that these samples will provide a valuable clue to the effects of benzole on air-cooled engines. Practically no trouble has been experienced throughout the trip, and the "tender," a similar machine carrying four cans of fuel in addition to a twelve stone passenger, was still running so well that it was not considered necessary to strip the engine. At the conclusion of the 5,000 miles the engine will again be examined, and in the meantime the machines are continuing the test, and, in addition, serving the useful function of acting as *liaison* between the London and Coventry offices of *The Motor Cycle*.

THE MONT VENTOUX HILL-CLIMB.

HEAVY rain interfered somewhat with the Mont Ventoux hill-climb on September 27th, organised by the Lyons M.C.C. The wet surface at the corners prevented high speeds, so it is not surprising that the fastest time of the day, 3m. 42 1/5s., by Vulliamy (Alcyon), was not a record. This stands at 3m. 23 4/5s.

The winners of the various classes were: 250 c.c.—Joly (Alcyon), 4m. 22 4/5s. 350 c.c.—Vulliamy (Alcyon), 3m. 42 1/5s. 500 c.c.—Péan (Peugeot), 3m. 56 3/5s. 750 c.c.—Greame Fenton (A.B.C.), 4m. 0 4/5s. 1,000 c.c.—Vache (Sunbeam), 3m. 50 1/5s. Sidecars.—Yenné (G.L., 750 c.c.), 4m. 27 2/5s.

Among the British machines that competed, in addition to the A.B.C. and Sunbeam, may be mentioned Nodet and Gauthier (Triumphs), second and fourth in the 750 c.c. class, the Sevez (B.S.A.), second in the sidecar class.

Club News

Exeter M.C. and J.C.C.

Only ten members competed in this club's recent reliability trial from Exeter to Falmouth and back, and all but one, who experienced tyre trouble, finished to time. Two half days were taken, the outward journey being made on the Saturday afternoon, and the return during the following day.

Wolverhampton M.C.C.

The following are the results of the Wolverhampton M.C.C. open hill-climb:

SUNBEAM MEDAL (fastest time of the day).—G. Dance (3½ Sunbeam), Class 6a, 46s.

ALFRED BIRD CUP (best performance on formula by a Wolverhampton Motor Cycle Club member).—G. Dance, Class 4a, figure of merit 2,680.

WOLVERHAMPTON MOTOR SERVICES CHALLENGE SHIELD (best amateur performance on formula by a Wolverhampton Motor Cycle Club member).—R. Brown (3½ Sunbeam sc.), Class 10a, figure of merit 4,500.

A. J. STEVENS GOLD MEDAL (best amateur performance on formula by a solo rider).—G. E. Boston (2¾ A.J.S.), Class 4b, figure of merit 3,480.

THE CLYNO CHALLENGE CUP (best performance by a sidecar rider on formula).—G. Dance (3½ Sunbeam sc.), figure of merit 3,121.

THE DIAMOND GOLD MEDAL (best amateur performance on machines up to 350 c.c. on formula).—G. E. Boston (2¾ A.J.S.), Class 4b, figure of merit 3,480.

CLASS 1.—O. G. Beman (2¼ Autoglider), silver medal.

CLASS 2a*.—A. Butterfield (2¼ Levis), gold medal.

CLASS 2b*.—W. Savage (2½ Sun-Villiers), gold medal.

CLASS 3a*.—R. E. Pagb (2½ Levis), gold medal.

CLASS 3a†.—W. H. Butterfield (2¼ Levis), gold medal.

CLASS 3b*.—1, A. Butterfield (2¼ Levis), gold medal; 2, W. Savage (2½ Sun-Villiers), silver medal; 3, H. Taylor (2½ Diamond), bronze medal.

CLASS 3b†.—A. Butterfield (2¼ Levis), gold medal.

CLASS 4a*.—1, G. Dance (2¾ Sunbeam), gold medal; 2, G. Kuhn (2¾ Levis), silver medal; 3, G. E. Boston (2¾ A.J.S.), bronze medal.

CLASS 4a†.—G. Dance (2¾ Sunbeam), gold medal.

CLASS 4b*.—1, G. E. Boston (2¾ A.J.S.), gold medal; 2, H. C. Heath (2¾ A.J.S.), silver medal; 3, B. Cadwell (2¾ A.J.S.), bronze medal.

CLASS 4b†.—G. E. Boston (2¾ A.J.S.), gold medal.

CLASS 5a*.—1, G. Dance (3½ Sunbeam), gold medal; 2, T. De la Hay (3½ Sunbeam), silver medal; 3, H. S. Noakes (3½ Norton), bronze medal.

CLASS 5a†.—G. Dance (3½ Sunbeam), gold medal.

CLASS 5b*.—1, H. S. Noakes (3½ Norton), gold medal; 2, C. Sgonina (3½ Norton), silver medal; 3, G. E. Boston (2¾ A.J.S.), bronze medal.

CLASS 5b†.—G. E. Boston (2¾ A.J.S.), gold medal.

CLASS 6a*.—1, G. Dance (3½ Sunbeam), gold medal; 2, T. De la Hay (3½ Sunbeam), silver medal; 3, A. T. Noakes (3½ Norton), bronze medal.

CLASS 6a†.—G. Dance (3½ Sunbeam), gold medal.

CLASS 6b*.—H. S. Noakes (3½ Norton), gold medal.

CLASS 6b†.—H. C. Heath (2¾ A.J.S.), gold medal.

CLASS 7a*.—1, T. De la Hay (3½ Sunbeam), gold medal; 2, G. Dance (2¾ Sunbeam), silver medal; 3, C. Wade (2¾ A.J.S.), bronze medal.

CLASS 7a†.—C. Wade (2¾ A.J.S.), gold medal.

CLASS 7b*.—1, H. S. Noakes (3½ Norton), gold medal; 2, C. Sgonina (3½ Norton), silver medal; 3, B. Cadwell (2¾ A.J.S.), bronze medal.

CLASS 7b†.—H. C. Heath (2¾ A.J.S.), gold medal.

CLASS 8a*.—G. Dance (3½ Sunbeam sc.), gold medal.

CLASS 9a*.—G. Dance (3½ Sunbeam sc.), gold medal.

CLASS 10a*.—G. Dance (3½ Sunbeam sc.), gold medal.

CLASS 10a†.—G. Dance (3½ Sunbeam sc.), gold medal.

* On time. † On formula.

Future Events.

Oct. 11.—Cardiff City and District M.C.C. and L.C.C. Consistent Driving and Reliability Trial.
Oct. 11.—Wolverhampton M.C.C. Members' Reliability Trial.
Oct. 11.—Birmingham M.C.C. Social Run.
Oct. 19.—Ilkeston and District M.C.C. Run to Crick.
OCT. 25.—LIVERPOOL M.C. OPEN RELIANCE CUP TRIAL.
Oct. 25.—South Birmingham M.C.C. Trial for Sangster Cup.
Oct. 26.—Ilkeston and District M.C.C. Run to Chatsworth.
NOV. 1.—SOUTH BIRMINGHAM M.C.C. OPEN TRIAL FOR PALMER CUP.
Nov. 8.—Birmingham M.C.C. Closing Run.

Essex M.C.

The hill-climb arranged for Saturday, the 4th, had to be abandoned owing to the railway strike. It is hoped to hold the event next spring.

Camberwell M.T. Old Boys' Association.

The above Association was formed after the Armistice was signed, and is composed of all ex-soldiers who were stationed at the London M.T. Repair Depot (Motor Cycle Section) R.A.S.C., Camberwell, during the war.

The first annual gathering was held on the 28th of last month, and notwithstanding the scarcity of petrol in consequence of the railway strike, and also the large number of members still in the Service, twenty-five of the "Old Boys" assembled at Alms Hill, Henley-on-Thames, and some capital sport ensued.

H. Jepson (8 Zenith sc.) climbing Alms Hill with two passengers on the occasion of the first annual gathering of the Camberwell M.T. Old Boys' Association.

A cheer greeted the pioneer of the old depot, namely Ted Warren (afterwards Lt. Warren), when he drove up with his 8 h.p. Zenith.

H. Jepson (5 Zenith) was the first to succeed in reaching the summit, and he was closely followed by S. C. Lambert mounted on a 1919 Triumph. A 1914 3½ h.p. Rover ridden by F. Willitts then proved its worth by completing the course. R. Chitty made a praiseworthy attempt with a 4¼ h.p. single James and sidecar, but was compelled to retire when only thirty yards from the top.

The event of the afternoon was Jepson's double ascent with sidecar and two passengers—truly a fine performance which quite appealed to everyone present. To negotiate Alms Hill with "three up" is most unique and well worth recording.

A luncheon at the Catherine Wheel Hotel, Henley, concluded a most enjoyable and successful day.

Liverpool M.C.

Most of the members of the Liverpool M.C. placed themselves at the disposal of the Food Control Office, the Post Office, and the police of their city. This club has abandoned its car trial arranged for Saturday next, owing to the strike.

Blackburn and District M.C.C. Hill-climb.

The above club held a hill-climb recently at Waddington Fells. The course was one mile in length on an average gradient of 1 in 10. A record crowd of spectators (nearly 2,000) assembled, and, despite a strong wind down the hill, the meeting was very successful. Results:

CLASS 2.—LIGHT CARS NOT EXCEEDING 1,500 C.C.
1. A. Morton (Little Midland) .. .. 2m. 55⅘s.

CLASS 3.—LIGHTWEIGHTS (270 C.C.).
1. W. Stanworth (2¾ Connaught) .. 2m. 50s.

CLASS 4.—LIGHTWEIGHTS (350 C.C.).

1. H. Hebden (3½ Norton) .. .. 1m. 17s.
2. S. A. Marks (2¾ Douglas) .. .. 1m. 22⅘s.
3. H. Walsh (3½ B.S.A.) .. .. .. 1m. 27⅘s.

CLASS 6.—SPORTING MACHINES UP TO 560 C.C.
1. H. Hebden (3½ Norton) .. .. 1m. 18s.
2. S. A. Marks (2¾ Douglas) .. .. 1m. 23s.
3. H. Smethurst (3½ Norton) .. .. 1m. 24⅘s.

CLASS 7.—NOT EXCEEDING 750 C.C.
1. H. Smethurst (3½ Norton) .. .. 1m. 10⅘s.
2. H. Hebden (3½ Norton) .. .. 1m. 17⅘s.
3. S. A. Marks (2¾ Douglas) .. .. 1m. 21s.

CLASS 8.—ANY CAPACITY.
1. *W. Lyons (7-9 Harley-Davidson) .. 1m. 10⅕s.
2. S. A. Marks (7-9 Harley-Davidson) 1m. 13⅘s.
3. H. Smethurst (3½ Norton) .. .. 1m. 16⅘s.

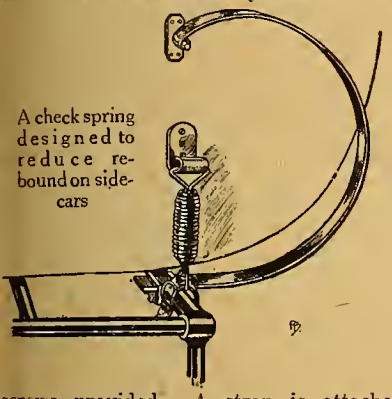
* Gold medal for fastest time of day.

PASSENGER MACHINES (560 C.C.).
1. H. Hebden (3½ Norton) .. .. 2m. 15s.

PASSENGER MACHINES (ANY CAPACITY).
1. B. Houlding (7-9 Harley-Davidson) 1m. 26s.

A SIDECAR CHECK SPRING.

A USEFUL check spring designed to reduce the excessive rebound of sidecars when travelling empty over bumpy roads has recently been placed on the market by Messrs. Herbert Terry and Sons, Ltd., Redditch. This fitting consists of a bracket which is fixed to the sidecar body immediately above the sidecar axle by means of the



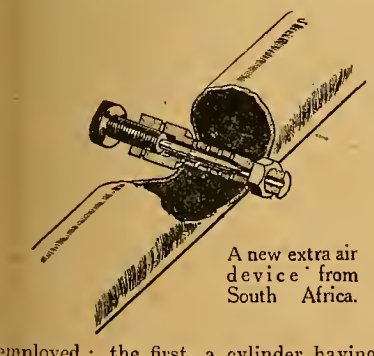
A check spring designed to reduce rebound on sidecars

screws provided. A strap is attached to the lower end of a coil spring, held at its upper end by the bracket, and secured to the axle tube or any other fitting which will hold the spring in vertical tension. The body is then pulled down by the strap, subjecting the sidecar springs to a load equivalent to the passenger's weight, thus limiting the movement of the springs and obviating the necessity for holding the sidecar down.

THE BAILLIE AIR VALVE.

TO enable the rider to admit a larger proportion of air to the mixture than is passed through the carburetter, thus reducing petrol consumption, a simple device, which can be adapted to almost any machine without the aid of extra fittings, has recently been produced by Mr. J. Baillie, 3, Commercial Road, Pietermaritzburg, Natal, South Africa.

The valve is inserted in a hole drilled in the induction pipe and held in position by a nut located on the smaller end of the device. Two components only are



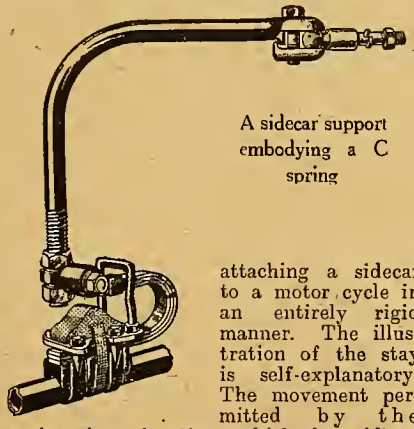
A new extra air device from South Africa.

employed: the first, a cylinder having a greater diameter at one end, providing a shoulder to prevent the valve passing through the induction pipe and to accommodate the second component, a screw, which acts as a needle valve in conjunction with a seating contained in the cylindrical portion. A series of small holes are drilled in the section of the cylinder inside the induction pipe, and by turning the milled head on the end of the screw, air can enter by way of the hole at the smaller extremity. By further withdrawing the needle, the holes drilled in the larger end of the cylinder are uncovered by the needle screw, thereby admitting a still greater quantity of air.

This device, which the inventor and manufacturer, Mr. Baillie, has patented in South Africa, England, and America, has had considerable success, and he is anxious to place it on the British market.

A SPRING SIDECAR CONNECTION.

WE think it is admitted by motor cyclists of experience that a too rigid sidecar is by no means desirable, and the designers of the American National sidecar evidently share this opinion, for their 1920 model embodies a sidecar arm which is connected to the chassis through a laminated "C" spring, the object of which is to absorb the vibration that results from



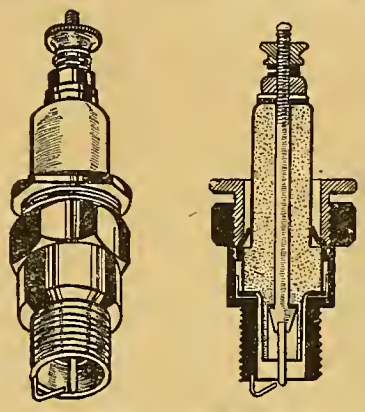
A sidecar support embodying a C spring

attaching a sidecar to a motor cycle in an entirely rigid manner. The illustration of the stay is self-explanatory. The movement permitted by the spring is only $\frac{3}{4}$in., which is said to be sufficient to take all the jar out of sidecar driving. It is not possible for the motor cycle to lean more than a few inches to the right or left.

AN ACCESSIBLE BRASS PLUG.

THE Apollo L.B.C. metal plug, suitable for engines of medium compression, is, in addition to being immune from the effects of rust, simply designed in order to facilitate its dismantling for cleaning purposes. The body of the plug, consisting of a brass die casting, having on its outer surface an hexagonal-shaped nut, is threaded internally to receive another brass cylinder, also provided with an hexagonal nut, the duty of which is to retain in position the porcelain insulator of the central electrode. The enlargement of the porcelain at its centre provides a flange at the upper and lower extremities. The former is provided with a copper washer lined with asbestos, and against this the centre brass cylinder is screwed, in order to press the lower flange against an asbestos washer placed on the top of a platform inside the brass body. The lower end of the central electrode is held against a washer in a recess at the lower end of the porcelain cylinder, by means of a nut located at its upper extremity.

This plug is sold by the Apollo Manufacturing Co., Apollo Works, Moseley

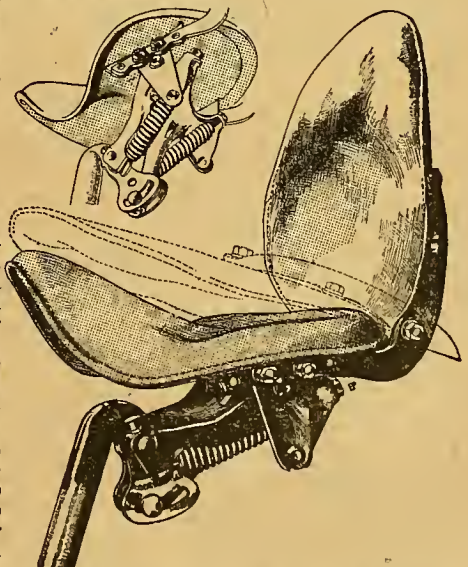


The Apollo L.B.C. sparking plug.

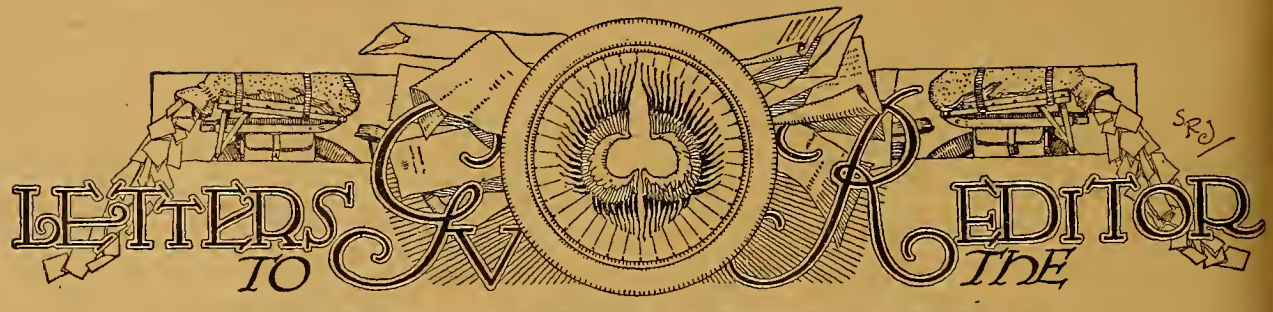
Street, Birmingham, and, being of a foolproof type, can be taken to pieces and cleaned with the greatest ease.

A LUXURIOUS MOTOR CYCLE SEAT.

XL-ALL, LTD., of Hall Green, Birmingham, have specialised for many years on the production of scientifically sprung and anatomically shaped seats for motor cyclists. Our drawing shows the latest effort in this respect, combining an improved saddle on the usual XI-All parallel motion principle and a carefully shaped back-rest. The latter may be folded over the seat to protect it from rain when the machine is not in use. This device should give the greatest possible satisfaction, especially on a sidecar outfit.



A recent addition to the list of XL-All saddles. This model has been designed in conjunction with the back rest. Such a saddle will no doubt appeal to many motor cyclists who desire the maximum of comfort.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

ANOTHER DANGEROUS CORNER.

Sir,—I should like to direct your attention to the dangerous corner of the Stalham road to Hickling, as a considerable number of motors and motor cycles pass round it. I have myself experienced a smash at this corner, and have discovered that there have been many before. Being a keen motor cyclist I feel that by making this known, it will caution the public. O. T. HAMLYN.

DANGEROUS ROAD REPAIRS.

Sir,—I beg to call to your notice the most appalling state of the main road at Burton Latimer, Northants. The road is under the pretence of being repaired, which leaves the road a sea of wet tar with a few large stones on top, making a most dangerous surface for any unfortunate motor cyclist who finds it necessary to use it.

I hope the publicity of your journal will liven up some of the officials responsible for this. C.V.F.

Market Harborough.

THE MODERN NOVEL.

Sir,—Perhaps the following may interest you as an example of the education of our modern novel writers on motoring subjects: "Over and in went the third-speed clutch, and the car ate up the road."

The lines occur on page 42, chapter iv., of the popular 7d. edition of "Ye Gods," by Eric Hudson and H. Grahame Richards, published by Hutchinson.

I am afraid even the gentle pets of my own corps cannot equal this regular road hog.

ALEC. S. GLEAVES, Lt. 8th Tank Batt.

ROLLER BEARINGS.

Sir,—I have noticed recently that the practice of dispensing with separate races in connecting rod and other roller bearings is being hailed as a novelty.

This method, while certainly very efficient, can hardly be described as new. The early Singers, as far back as 1904, had both the crankshaft and crank pin hardened, also the eye in the big end of the connecting rod, a separate outer race being used for the main bearings.

The bearings in question had caged rollers, and were of more generous proportions than the majority of modern designs. As regards wear, I know of an engine of this date which ran from 1904 to 1913 with the original bearings untouched, and these at the latter date were still in good condition. SIDNEY C. HERSEY.

PETROL CONSUMPTION.

Sir,—On a recent tour from Todmorden to Ayr (N.B.) and back on a 1915 7-9 h.p. Harley-Davidson combination, which I purchased and overhauled myself, I carefully booked down all petrol used, with a view to ascertaining my petrol consumption. At the termination of the run, after measuring the petrol in the tank, I found that my consumption was half a pint under nine gallons, and the distance (on a tested and found correct speedometer) was 641.5 miles, giving 71.28 m.p.g.

No special effort was made for a petrol test, and petrol was used from the tank on several occasions for hand cleaning purposes after small repairs and cleaning, and also for "doping" on all cold starts. The petrol used throughout was Shell No. 1, and the carburetter is the standard Schebler, with no patent "economy gadgets" fitted.

Throughout the trip I had 120 lb. weight in the sidecar, whilst my own weight is 168 lb.

I had a witness with me all the trip, which is perhaps as well, as several garage people where we called refused to credit my statement as to petrol consumption.

Messrs. Harley-Davidson Motor Co., Ltd., inform me that they have not heard of such a high average having been maintained before over so long a distance.

NORMAN BROWN.

STANDARDISATION OF CONTROLS.

Sir,—*Re* your remarks on the standardisation of controls, would it not settle the difficulty if the throttle was always arranged to shut off towards the handle-bar and be directly over it when shut off? This would make no difference to the levers opening either way. C.A.E.

Ashford.

BROKEN BOTTLES ON ROADS.

Sir,—It may interest readers of *The Motor Cycle* to know that the road from Farnborough, Hants., to Blandford, Dorset, *via* Alton, Winchester, Romsey, Ringwood, and Wimborne, is in good condition, with the exception of the road between Romsey and Ringwood, where the surface is rather loose.

I would warn motorists to watch the road between Alton and Winchester very carefully, as I found several places where broken bottles were thrown on the road, which appeared to be there more by design than accident, and although I rode as carefully as possible, I punctured my back tyre, also cutting the cover rather badly.

W. H. O. CUNNINGTON.

[It is a punishable offence to throw broken glass on a public road.—ED.]

SPEED WOBBLE.

Sir,—With reference to this somewhat long and drawn-out subject of "Speed wobble," at last two really good reasons have been sent in, viz., holding the handle-bars too tightly and closing the throttle too quickly.

Personally, I imagine that "G.E.S." got "wind up," and accordingly hung on hard to his handle-bars, and hence the wobble.

I am convinced that those of us who suffer from skidding do hold their handle-bars far too tightly. I have ridden purposely behind riders to observe this, and have almost invariably found it to be the case.

Mind you, I do not go so far as to say that holding them loosely is a *sure* prevention, because accidents *will* happen (I came off myself through a somewhat sudden skid on moss after a frost), but it is most certainly safer.

Gosport. B. S. NORTSUNBEAM

Sir,—I have noticed several letters on the above subject. I have, on several occasions, experienced this phenomenon; on the first occasion sustaining a fall at well over 50 m.p.h. on a spring frame Indian. I believe the wobbling to be caused, as stated by one of your correspondents, by the braking effect of closing the throttle, the wheels being out of track. The remedy, which has never failed me when applied, is to jam the throttle wide open once more, and endeavour to steer across and across the road in as much of a zigzag as is possible at the speed. Then the throttle may be gradually closed once more. Speed wobble only occurs when a machine is travelling in a straight line and when its wheels are out of track—at least, such is my experience.

R. THELWELL NORTH.

THE VALUE OF THE AUTOMOBILE ASSOCIATIONS.

Sir,—I think the following will be of interest to motor cyclists generally.

While touring in Devon recently I had the misfortune to strip the gear pinion of my motor cycle. I had not been stopped five minutes before an A.A. scout appeared. Of course, he could do nothing, as a new pinion was needed. Knowing the difficulty of obtaining spares, I anticipated being hung up in an out-of-the-way corner of the country for a week or so, but the A.A. scout informed me that the Association would get me a new pinion if I asked them. I managed to get to a place where I could put up, and wrote at once to the A.A. in Birmingham, asking them to obtain for me a new pinion. This I received within two days, although the Association explained that they had had a little difficulty in obtaining the part. As the A.A. had trouble in getting the spare, I doubt whether I should have obtained one myself.

I do not think that this branch of the A.A. service is generally known amongst motor cyclists, but a word in your valuable paper would remedy this.

Although I have only been a member less than a month, I have received in "service" several times the value of my subscription. A. E. PHILLIPS.

CONTINENTAL COMPETITIONS.

Sir,—Concerning hill-climbs, reliability trials, races, etc., held on the Continent, I have frequently been struck by the fact that if there are any British entries they are not generally of the "first water"; nevertheless, "Blighty" manages to figure to some extent.

What an advertisement and fillip generally to our trade if the manufacturers would knock their heads together and pool top notch riders, also expenses, in making it their business to let a Sunbeam dance up the hills whilst an A(k) B(eer) C made the milestones into walls, every event of any importance being collared by the Old Country, to the complete extinction of practically everything not British. It can be done, but the wily maker says "No; nothing doing. I prefer to work by myself, and even if I won every event on the Continent I could not sell them one machine."

This may, or may not, be correct, depending largely on the quality of Mr. Stick-in-the-mud's grey matter. The actual point is that by consistently proving the superiority of British machines in open competition against the world's cracks Mr. Manufacturer would have far less to fear from American invasions or Continental dumping, so far as our Dominions, Colonial, or home markets are concerned.

And as our forefathers seemed to possess that "taking way" which has resulted in our (perhaps, I had better say) "having an interest" in so many large slices of earthy matter, any method of consolidating Briton's pre-eminence in those slices is surely worth consideration.

The fact that machines of various British makes compete one with the other, certain crack riders winning fairly consistently, does not convey that impression to a would-be purchaser living thousands of miles away that many awards won in our commercial rivals' camps would convey, and especially is this the case when he has our rivals' goods continually dangled under his nose. H. USHER.

STARTING WITH A BROKEN VALVE LIFTER.

Sir,—*Re* "Ixion's" article on September 11th, describing his efforts to start his machine with a broken valve lifter, I think I can give him a tip which will help him should he ever find himself in similar trouble.

In 1911 I had a 3½ h.p. single, with a rod and lever arrangement to lift the valve. After 10,000 miles running this developed wear at the points where movement took place, and became uncertain in action. When it first went on strike, I used pennies under the toe of valve, and also used the compression tap for starting, and other devices, all of which were troublesome and unsatisfactory.

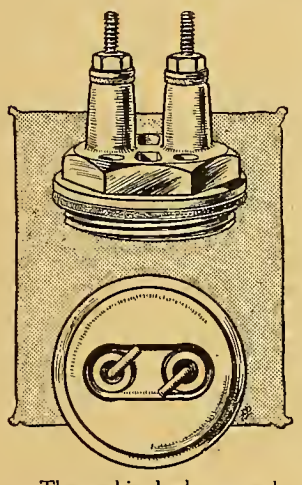
While thinking out a new arrangement for the lifting gear, to replace the old one, the following tip occurred to me, and I used it regularly until the new arrangement was fitted. Prepare the machine for an ordinary running start, but *leave the throttle closed*. Then push the machine over the first compression and continue pushing. After the resistance of the first compression stroke has been overcome, the closed throttle maintains a vacuum in the cylinder, and the machine can be pushed with little more exertion than is required when the valve is lifted in the ordinary way. When sufficient speed is attained, yank the throttle lever open with the thumb, and the engine will fire just as though the valve had been dropped. No preparation, such as opening cocks or "propping levers up with bits of wood," is required, and the machine can be started uphill if necessary, or under any conditions where a running mount can be used.

Since then I have given the tip to several riders in similar difficulty, and they have found it equally useful.

In conclusion, I must say that I have come across many useful tips in "Ixion's" interesting weekly articles during the last twelve years, and am now glad to be able to give him one in return. S. FRANK.

PERMANENT PLUG DESIGN.

Sir,—"Chinook's" article on "Permanent Sparking Plug" calls to our mind experiments we tried in this direction many years ago, and we are forwarding for your inspection the first of many attempts in this direction. Without remembering the exact date, we fancy it must be at least twelve years old. The idea provided two plugs in the one cap, and the central electrodes were extended in order that the plug might be used as a two-pole for multi-ignition. We modified this arrangement later, but, unfortunately, this is the only complete cap remaining.



The combined valve cap and sparking plug mentioned by Norton Motors Ltd.

We are greatly in favour of the idea, and believe many sparking plug troubles could be overcome if the principle suggested by "Chinook" (whose articles, by the way, we always read with interest) was adopted by sparking plug makers, although it would be an obstacle in the way of mass production.

NORTON MOTORS LTD.

SPARKING PLUG INSULATION.

Sir,—I recently experienced a rather curious trouble with the 6 h.p. J.A.P. engine of an Enfield sidecar combination.

After driving fairly hard for a few miles the outfit commenced to slow down, and at the same time a series of staccato grunts from the engine indicated a compression leakage from the rear cylinder. After allowing the engine to cool it started and ran quite correctly until warmed up, when the same trouble recurred.

Eventually the defect was located in the sparking plug of the rear cylinder which was fractured just below the plug body. When cold the break could not be seen, and the plug was compression tight. As soon as the engine warmed up, however, the electrode expanded longitudinally and allowed the faces of the fracture to separate.

The only virtues which porcelain appears to possess as a plug insulator are cheapness of manufacture, and also the ease with which a constant quality can be produced.

Porcelain is very brittle, and, with increase of temperature, rapidly loses its insulating qualities. As an illustration of this fact the filament of the Nernst lamp was made of a mixture of porcelain and magnesite, both good insulators when cold, but on being heated from an external source the element becomes quite a good conductor. This phenomenon may possibly account for the failure of some porcelain plugs in very hot engines.

Mica, on the other hand, being a natural product, is subject to metallic veins, and therefore all mica used in plug construction has to be very carefully selected; and for this reason, combined with the additional work necessary in building up the insulator, mica plugs are considerably more expensive than the porcelain variety. If a mica plug satisfactorily passes its over-pressure test it is practically indestructible mechanically, and possesses the additional advantage that if it should go down large lumps of porcelain do not fall into the engine cylinder. SPARKS.

Ecclesfield.

WAR WRECKAGE.

Sir,—Will you kindly insert the following in your valuable paper? I wish to air a grievance, which is no doubt shared by many other readers at this time. Just recently I have travelled twenty-four miles and fourteen miles to see two motor cycles that were advertised. In each case the machine was grossly misrepresented, and ought to have been described as *portions of war wreckage;* then we should not have our valuable time wasted in going to see such rubbish. The last I saw was advertised as a "Triumph 4 h.p., 1915, countershaft model, three-speed, less magneto and carburetter; £38."

This is what I saw: The remains of a Triumph with the engine radiating gills chipped, gear box with no external fittings of any kind or pulley, a bullet hole through the tank, which had no pump or fittings of any kind, no front tyre and wheel buckled, a worthless tyre on the back wheel, no saddle, no magneto, no carburetter or mudguards, and condition of the interior of the engine and gear box unknown. It stood out in the rain amongst many other old veterans, all in a worse plight than this one, which was an awful sight. OLD READER.

Fulham.

ENGINE DESIGN.

Sir,—With reference to the letter from "Two-stroke" in your issue for August 14th, in reply to "Entente's" comments on outside flywheels, I think "Two-stroke" is inclined to bring forward imaginary drawbacks which do not exist, and ignore the greatest points in favour of this type of engine.

Taking the four-stroke outside flywheel single, I have never found that my present machine (*i.e.*, a Blackburne) does any mud and oil-throwing, nor have I found any trouble from a "rapidly rotating disc in the vicinity of one's trousers." Regarding ground clearance, he has only to look at the 1919 Blackburne to satisfy himself that there is ample clearance for any roads (about 5½in.)

The great points which both your correspondents do not seem to consider are these: By the use of the outside flywheel it is possible to adopt a car-type one-piece crankshaft and split big end bearings. Also the freedom from "gumming up" owing to thick oil round the flywheels and the undeniably slow running and steady pulling at low speeds of this type of engine are points which are well worth consideration. J. A. WATSON-BOURNE.

SPARE PARTS.

Sir,—How is this for alertness in supplying spare parts? On September 9th I broke down in Blackpool whilst on holiday. 1914 engine, broken piston, gudgeon pin, and bent connecting rod. On the evening of that day I wrote to the engine makers, Messrs. F. E. Baker, Ltd. (Precision engine), for a *pro forma* invoice for the new parts; received invoice September 11th, despatched cheque in payment same day, and received the new piston, gudgeon pin, and connecting rod on the morning of September 15th.

Usual disclaimer. W. R. DAVIES.

Sir,—May I give my own experience of the courtesy and kindness of the Wulfruna Engineering Co.? In 1915 I bought one of their excellent T.D.C. two-stroke single-geared motor cycles, and after I had had it a few months I decided to fit a gear box, and received the parts from the company and fitted it myself. On the first run with the converted machine the gears seized up, and on examination I found that the main ball race had gone to pieces. I placed the machine on to the train and took it to the Wolf works myself, quite prepared to pay up for a new box and to be told that I had fitted it out of alignment. Instead of this I was treated more than kindly, a new gear box was put on in less than twenty minutes, I was taken over the works, given several very useful spare parts, and went on my way rejoicing. A fortnight later I was in Wolverhampton again, and the second box went the same way as the first. Without a murmur the company fitted a third gear box so promptly that I was able to continue my tour with the loss of only two hours!

In all my dealings with the firm I have met with more than courtesy, and their treatment of me with regard to my new "Wolf" makes me feel that I can never repay them for their consideration. I have no interest in the firm beyond that of a grateful client.

(The Rev.) M. P. SARGENT.

MOTOR CYCLES FOR DEFERRED PAYMENTS.

Sir,—At the present time, when there is an abundance of orders and a dearth of machines, agents are naturally reluctant to sell on "easy terms," and most of the firms who, during the existence of the petrol restrictions and the consequent lull in motor cycling, were only too glad to sell on these terms have now abandoned the gradual payment system. This hits the "demobbed" motor cyclist rather badly, as, of course, his military service has given him no opportunity to accumulate the necessary capital to purchase a new mount.

It is distinctly refreshing to find at least one firm of reputable agents who are still willing to consider the needs of the "capital-less" one, and their fairness in all things is worthy of publicity. This is the Eastern Garage Co., of 418, Romford Road, Forest Gate, London, through whom I have purchased a machine on these terms.

The surprisingly short time I had to wait for delivery plainly showed me that my position on their waiting list was in no way altered, because I was not purchasing on cash terms. Throughout the deal they treated me with the utmost courtesy, and I am now enjoying the fruits of my purchase—a 3 h.p. Enfield, which is a little gem of a machine.

The usual disclaimer. MANCUNIAN.

FROM THE EAST.

Sir,—In the officers' mess here away in the wilds I came across a copy of *The Motor Cycle* with the report of the Scottish Trials. It was a real treat to see it. How I would have liked to go over the old hills. I borrowed the copy and devoured it from end to end. Reading through that issue I was pleased to see so many of the old names, and I hope to have the pleasure of being with them next year, if not this. No doubt the boys will remember my camera. You can tell them that it is very busy away in these wild spots. I manage occasionally to borrow a W.D. Triumph, and get a bumpy ride. Tin Lizzies are very popular for these districts of tracks, *not* roads. That was a fine issue; glad to see you are going so strong.

Erankeui, Asia Minor. J. BRUNELL, Lt.

[Lt. Brunell is now back in England.—Ed.]

JET SIZES.

Sir,—I should be extemely grateful if one of your readers who rides a Sunbeam 3½ h.p. combination, with Amac carburetter, would be good enough to tell me *(a)* what size jet he uses *(b)* whether he finds it gives ample power for ordinary hills, etc., *(c)* what m.p.g. he obtains with it.

I am using a No. 31 and barely get 50 m.p.g., and even much less in hilly country or with a strong head wind. By "hilly country" I mean parts of Kent and Sussex, not Scotland or anything abnormal. I have tried the jet adapter recently advertised in *The Motor Cycle*, and find it quite hopeless as far as I am concerned. Possibly it is my lack of knowledge, but in my opinion the adjustment possible is nowhere near small enough. I find it is either too little petrol or too much. Will any reader who has used this adapter give me his experiences? It seems to me a much more gradually tapered screw adjuster is required.

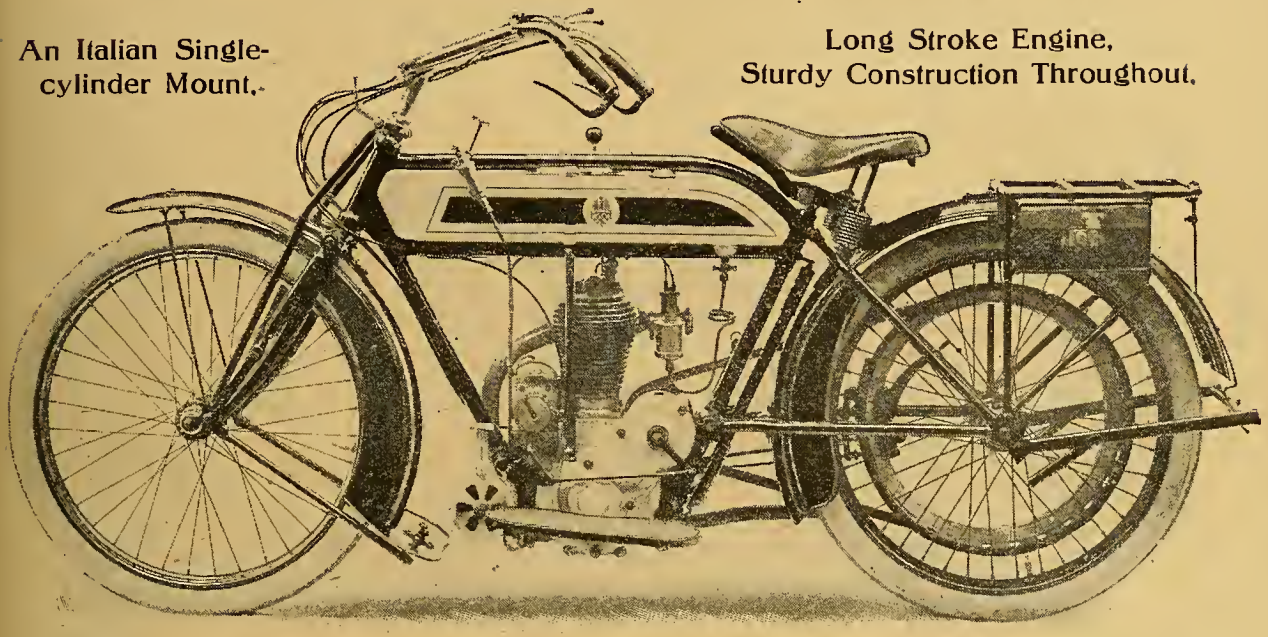
THE 4 h.p. BIANCHI MOTOR BICYCLE.

An Italian Single-cylinder Mount.

Long Stroke Engine, Sturdy Construction Throughout.

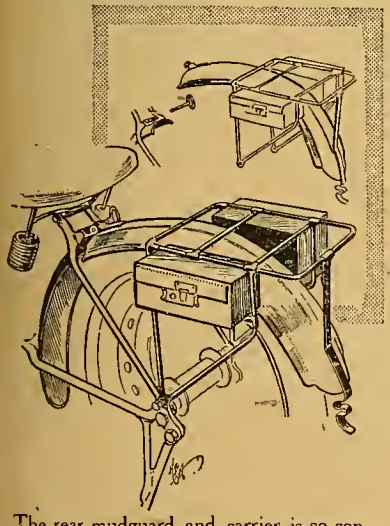


The latest Bianchi model, an Italian production fitted with a 4 h.p. engine of 498 c.c. and three-speed gear built integral with the crank case.

OUR sister journal, *The Autocar*, has many times referred to the excellent qualities of the Italian motor cars, and numerous excellent examples of these have been seen in this country. Until quite recently, however, no Italian motor bicycles have come to England, but since the armistice one Italian machine, at least, has arrived in London—the Bianchi—which is handled by the famous firm which makes the well-known Bianchi car, Bianchi Motors, Ltd., 26, St. James's Street, London, S.W.1.

A Long Stroke Single.

Built almost entirely on British lines, the Bianchi motor cycle, though it does not present any startling novelties, may be said to be a thoroughly practical mount, the performances of which we shall watch with interest in future trials. The most notable feature about the Bianchi is the power unit, which consists of an engine 75 mm. × 112 mm., 498 c.c.; it will be seen that the designers have pinned their faith to the long stroke, of which there are not many examples in British motor cycle engines at the present time. One is at first struck by the shape of the cylinder which is rather reminiscent of the Rudge, as the radiating fins are cast so that the cylinder has a pear-shaped appearance.



The rear mudguard and carrier is so constructed as to give quick detachability.

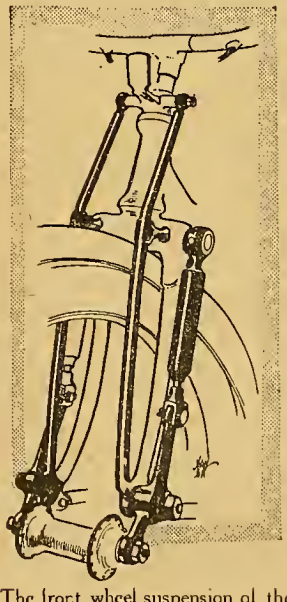
Unit Construction.

The gear is incorporated in the crank case, which also contains a multiple disc clutch, constructed in a similar manner to the clutch employed on the Bianchi car. It is operated by a quick-thread outside the crank case. The final drive is by belt, and on this score we feel constrained to express the opinion that the small countershaft pulley, despite its high and protected position, would prove far from efficient in the transmission, if a sidecar was used, under the weather conditions usually associated with British touring.

Accessible Brake Adjustments.

Following the arrangement now on standard cars, the near side pedal actuates the clutch and the off side pedal the brake, which works against the inside of the belt rim. There is another brake working on the outside of the belt rim, and operated by the lever on the right of the handle-bars. The adjustment of the inside brake is effected by turning a milled screw on one of the coupling rods, and is exactly similar to that employed on the best motor cars.

The Bianchi engine-gear unit embodies a kick-starter which follows the usual quadrant and ratchet-wheel pattern, although the parts are external and, therefore, less immune from the ravages of mud and dust than most of the current English designs. Comfortable footboards are fitted. The spring forks are of extremely neat design, and points of convenience have been well studied, as the back mudguard is so designed that its rearmost half, which is combined with the carrier, is detachable, and, consequently, allows easy access to the back tyre.



The front wheel suspension of the 4 h.p. Bianchi.

THE STRISIDE SKIRT.

A divided skirt enabling ladies to ride the conventional type of machine in comfort

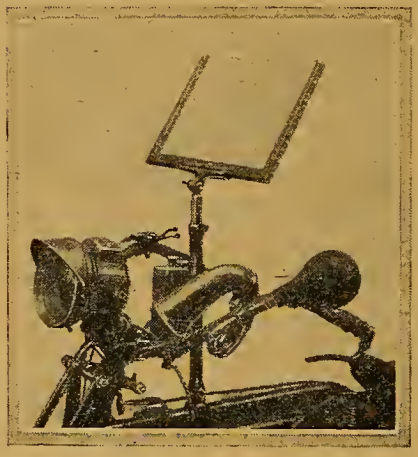
IN consequence of the growing popularity of motor cycling amongst ladies there has been a demand for a suitable skirt to enable a lady to use the normal "diamond" frame machine. A divided skirt, at the front and back of which are wide, inverted pleats, which expand during the exercise of the lower limbs, has recently been marketed by E. H. Harrison, 57, Gresham Street, London, E.C.2. Two cross pockets are provided, and on dismounting from the machine the cut of the skirt, which is made upon an entirely different principle from most garments of this kind, is not only elegant in appearance but does not betray the concealed division.

A serviceable motor cycling hat is also marketed by this firm, provided with adjustable side flaps, which may, if desired, be lowered to cover the back of the neck and ears, a strap fastened beneath the chin holding it in position. The peak, when raised, holds the goggles in position, but when riding it may be lowered to shade the eyes.

A MOTOR CYCLE WINDSCREEN.

A WINDSCREEN, as such, is no great novelty, but, up to the present time, solo motor cycle windscreens have not come into common use. Any device which will keep flies, dust, and rain off the rider's face and obviate the necessity of wearing goggles, will be welcomed by many. Naturally, the speed man, and the rider who objects to too many accessories on a motor bicycle, will not care for these fitments, but those who are out for comfort will invest in one and cannot fail to reap the benefits it offers.

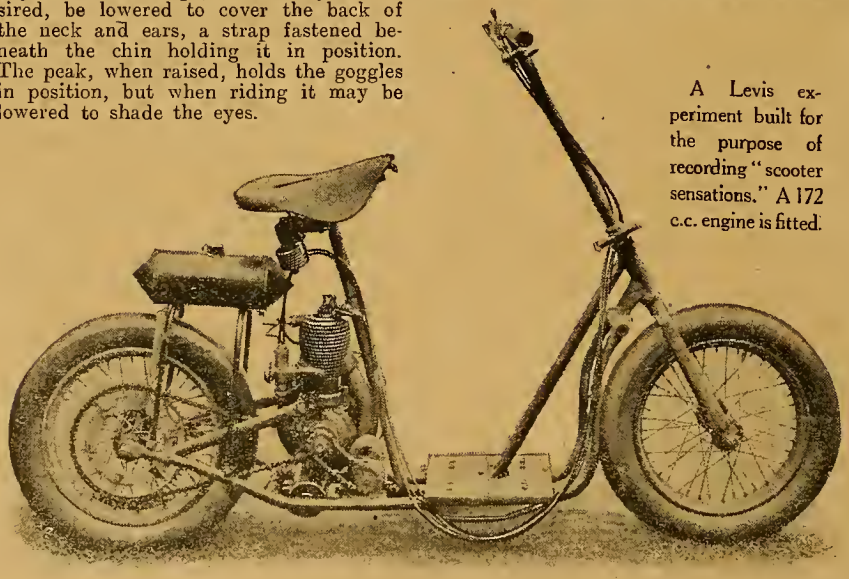
The latest of these windscreens has been placed on the market by the



A motor cycle windscreen marketed by the National Motor Co.

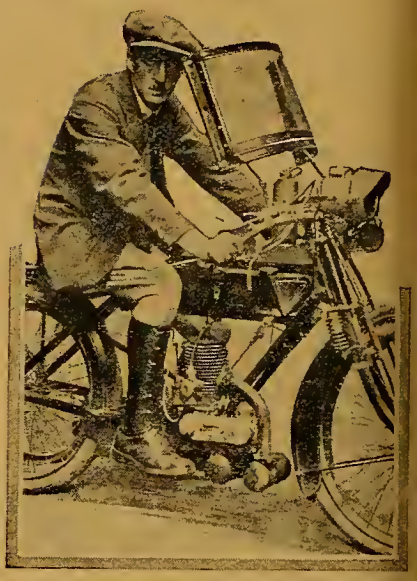
National Motor Company, 48, Bath Road, Edgbaston, Birmingham. The screen is held in a telescopic tube clipped to the top tube of the motor bicycle frame, and is of quite neat appearance. The rider's view is obstructed as little as possible, since there is no framework at the top.

Ordinary glass is fitted, but Triplex glass, which will not splinter, can be used: side wings can also be attached.



A Levis experiment built for the purpose of recording "scooter sensations." A 172 c.c. engine is fitted.

A WINDSCREEN FOR SOLO MOUNTS.



A windscreen designed for the use of the driver. Messrs. Easting Windscreens, Ltd., intend marketing this new form very shortly.

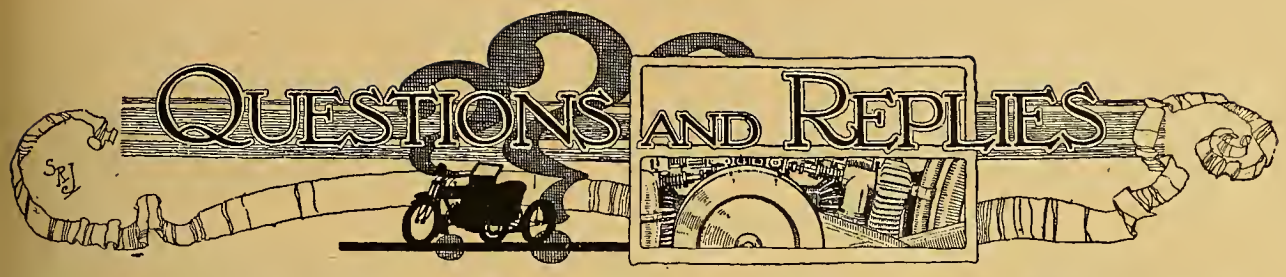
AN EXPERIMENTAL LEVIS SCOOTER.

AMONG the several motor cycle firms who have experimented with scooters, Messrs. Butterfields, Ltd., of Levis fame, are by no means least important. Their machine, which we illustrate, was constructed primarily to give the firm first-hand experience of the "sensations" of motor scooting in order that they might be compared with those of light motor cycles.

The public interest in scooters raised the curiosity of the makers of the Levis, and with an open mind as to the possibilities of this type of miniature machine, they decided to make a Levis scooter.

Fortunately, Messrs. Butterfields already had the nucleus of a suitable engine in the little flat twin two-stroke which they produced largely for war purposes. One of the cylinders, which has a capacity of 172 c.c., was adapted, and a neat little power unit was produced, which was fitted in the rear of a special open frame. The engine is supported at the rear by two stays which are part of the frame construction, by engine plates at the lower part of the crank case, and at the cylinder head by a lug at the seat tube. The wheels are fitted with 20 × 3 aeroplane tyres to absorb the road vibration.

Sufficient detail is shown in the illustration to render a more complete description unnecessary. We were able to inspect the little machine—which is, to all intents and purposes, a miniature open frame motor cycle—through the kindness of Mr. Albert Milner, the ex-Levis exponent, who now owns the "George in the Tree" Hotel, at Berkswell, incidentally a very popular Midland motor cyclists' rendezvous. We understand that Messrs. Butterfields have no intention of pursuing the experiments further, for the present at any rate.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply**. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Descending Hills on a Two-stroke.

The carburetter fitted to my Triumph Junior two-stroke does not appear to allow the entrance of any air to the cylinder when the throttle slide is closed. In view of this fact, what should I do in descending steep hills? If I raise the exhaust lever a fitful spluttering ensues, and blue smoke is emitted from the carburetter, as is common on two-strokes.—C.P.

When you descend a hill close the throttle but do not raise the compression valve if you wish your progress to be noiseless. The speed will also be greater than it would be if you release the compression.

Not Cricket.

I wrote to an advertiser, and offered some motor parts to him under a newspaper deposit system, but I sold these parts before I got a notice from the newspaper's office to say the advertiser's deposit had arrived. Can the advertiser take any action against me for not sending the parts, as I stated I would do in my letter?—C.D.C.

We do not think that the advertiser can take any action against you, although, at the same time, we rather think that you have been guilty of a breach of faith in selling the goods to someone else after expressing your willingness to receive his deposit. It is always safer to add "subject to being unsold" when writing potential purchasers.

Worn Big End.

I have a Triumph motor cycle with three-speed hub. I have just had a new piston from the makers. It is a good fit, and compression is good, but when travelling at speed, *i.e.*, when the road wheels seem to over-run the engine, there is a kind of knocking which seems to me as if the bottom of the piston knocks on the top of the crank case; there is a little play in the big end. How can this play be reduced? I think it is a ball bearing.—J.M.

If the new piston does not strike the crank case when the engine is being turned over by hand, it certainly will not do so when the machine is running at a high speed. In all probability the knocking or vibration which occurs when the machine over-runs the engine is due to play in the big end bearing. The big end has a bronze bush, not a ball bearing, and this will require to be renewed and properly fitted to the crank pin.

Touring in Devonshire.

I am contemplating a tour in the West of England, commencing in about a week's time, and should be glad if you would inform me whether you consider any parts of the road from Penzance to Bridgwater, more especially between Barnstaple and Minehead *via* Lynton, impracticable for a 1919 3½ h.p. Rudge Multi, ridden solo. In particular, do you think I should find trouble with the ascents or descents at Lynton and Porlock?—F.G.P.

The roads you mention include several bad hills, but there is nothing beyond the powers of a well-driven 3½ h.p. machine. The hills at Lynton and Porlock should present no difficulty if the weather is fine, but if wet, we doubt the possibility of surmounting them.

Motor Cycle for Cripple.

(1.) Do you know whether a person with one straight leg (stiff knee right leg) could ride a motor cycle? This person is able to ride a lady's fixed wheel bicycle with one left pedal. (2.) Are the qualifications for obtaining a licence to drive other than a capacity to drive? I mean, any physical test? (3.) Can you recommend a publication to help beginners?—S.L.

(1.) We think it would be *possible* to ride a solo motor cycle with the infirmity you describe, but would recommend an open frame machine, preferably with a sidecar attached. (2.) There are no special qualifications for obtaining a driving licence other than the payment of fee 5s. (3.) "Motor Cycles and How to Manage Them" can be obtained from our London office, 20, Tudor Street, E.C.4, price 2s. 10d. by post.

Twin Magneto for Single-cylinder.

I have a 4 h.p. single-cylinder Bradbury and a twin magneto. Can you inform me if it is possible to use it, and how to wire up so as to get a spark from the one side only? By turning the armature-shaft of the magneto I can get a lovely spark from the plug when the latter is held close to the magnets, but when moved to the cylinder it is absolutely dead.—J.T.

In order to use a twin magneto on a single-cylinder engine it will be necessary to remove one cam from the contact breaker cover and the carbon brush in the corresponding high-tension terminal. Unless you have the magneto actually mounted on the engine so as to obtain a good metallic return for the current between the sparking plug body and the magneto, you cannot expect a good spark.

A SCENE ON THE SCOTT SPORTING TRIAL.
At Dob Park the competitors were faced with the sudden dip down a gulley, at the bottom of which a mountain rivulet had to be forded.

Norton "Big Four."

[?] I have been thinking of purchasing a new Norton Big Four combination. As "Ixion" suggests this week, I want a machine which I can keep some years, but I have been told that the Big Four is like the T.T. models—built lightly internally for speed purposes, and is therefore not reliable or durable. (1.) Can you please advise me if I shall be all right in the Norton, as far as the above two points. (2.) Is there much difficulty in getting spares, owing to non-standardisation, etc.—W.H.B.

(1.) We do not think you need fear the troubles you mention, the bearings in the Norton engine are quite up to continued touring work, even in the sporting models. (2.) You will have no difficulty in obtaining spares for this machine.

Old Model A.I.V. Engine.

[?] I should be glad if you would kindly advise on the following points: My 7 h.p. (1908) twin Rex has developed the fault of conking out on the slightest incline. I packed the a.o.i.v. springs so that they only gave $\frac{1}{8}$in. lift, but in spite of this I am still troubled with above fault. I am also troubled with sluggish running. (1.) If inlet valves are packed to only give $\frac{1}{16}$in. lift, will this induce suction and eliminate sluggish running? (2.) Exhaust valves are timed to open $\frac{3}{8}$in. from bottom and close $\frac{1}{16}$in. over T.D.C. I am of the opinion this increases suction as exhaust gases are rushing out of combustion head. This will work somewhat on the method of induced draught. (3.) At slow speeds back cylinder constantly misfires. This trouble, I understand, is general with twins. I shall be glad if you will suggest a remedy. (4.) Crankshaft bush on driving pulley side of crank case occasionally works loose and unscrews, but when screwed tight allows from $\frac{1}{8}$in. to $\frac{1}{4}$in. side lash of crankshaft. Will this reduce power to extent of stopping engine? (5.) On engaging clutch, unless machine is run to speed of about 5-6 m.p.h., engine conks out. At times clutch will slip and not engage even after getting way on the machine. (6.) Carburetter was originally fitted with a No. 33 jet, but owing to heavy petrol consumption I reduced to 31, afterwards to 29, but had eventually to return to 31. Do you consider a 31 jet would be too small for this type of engine, as engine runs well on level when clutch has been successful?—Rex.

(1.) The automatic inlet valves of your engine should be free to open at least 5-32 of an inch. An opening of $\frac{3}{16}$in. even would not be too much. (2.) The exhaust valves should close just before the piston reaches the top dead centre. (3.) The misfiring in the rear cylinder may be due to air leaks in the carburetter connections; you might also experiment with varions adjustments of the sparking plug gap. You must make certain that both inlet valve springs are of the same tension. (4.) The end play of the crankshaft will not cause any particular loss of power, but its condition will be responsible for a good deal of engine noise. (5.) If yours is a single gear machine it will be certainly necessary to race the engine somewhat before engaging the clutch. The slipping is either due to incorrect adjustment or to the expanding band being badly worn. (6.) The 31 jet should be about right.

READER'S REPLY.

Fitting a Variable Jet.

In your issue for Sept. 18th, I notice a query *re* the W.S.R. jet adapter. Perhaps my own experience may be of use to your readers. My machine is a W.D. model Douglas, and I fitted one of these adapters. It was very useful, but awkward to reach, so I devised a handlebar control, and was surprised at the difference. First, regarding petrol consumption. I can get 130-140 miles per gallon without any of the discomforts of small jets. Secondly, regarding power. Hill climbing is, of course, made easier by opening out a little on hills. Thirdly, starting is much easier. For town riding the jet is opened a little to give slow running, keeping the air fully open. For country riding the jet can be closed down considerably, and the carburetter can be made very sensitive to the position of the air lever. For running on benzole and petrol the size can be varied with ease. Thus, if you run on benzole, and cannot obtain it on tour, a movement of the lever adjusts jet size for petrol.—X. F. Curtis.

EXPERIENCES WANTED.

"J.F.K." (Sherborne).—Metro-Tyler with or without two-speed; disc wheels in a wind.

"J.F.H." (Newcastle-on-Tyne).—Binks carburetter on 2¼ h.p. Levis, jet sizes, etc.

RECOMMENDED ROUTES.

Tamworth to Ellesmere Port.—W.B.

Tamworth, Lichfield, Rugeley, Stone, Market Drayton, Whitchurch, Chester, Ellesmere Port.

Brighton to Hanslope.—C.C.

Brighton, Horsham, Guildford, Chertsey, Staines, Windsor, Slough, Beaconsfield, Amersham, Chesham, Tring, Leighton Buzzard, Fenny Stratford, Stony Stratford, Wolverton, Castlethorpe, Hanslope.

Derby to Aberayron.—A.A.

Derby, Burton, Lichfield, *via* Watling Street to Shrewsbury, Montgomery, Newtown, Llanidloes, Dyffryn Castell, Aberystwyth, Llanrhystyd Road, Aberayron.

Rugby to Ipswich.—J.S.S.

Rugby, West Haddon, Harlestone, Northampton, Wellingborough, High Ferrers, Kimbolton, St. Neots, Cambridge, Newmarket, Bury St. Edmunds, Stowmarket, Needham Market, Ipswich. Approximately 135 miles.

Bedford to Billingham.—E.C.

Bedford, Eaton Socon, Buckden, Norman Cross, Wansford, Stamford, Colsterworth, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, Ferrybridge, Aberford, Wetherby, Boroughbridge, Thirsk, Tontine Inn, Yarm, Stockton, Billingham. Approximately 200 miles.

Awards on Perfection Spirit.

At the A.C.U. Trials, Llandrindod, ten gold medals and the Principality Cup were secured by riders using Pratt's spirit.

Satisfactory Sparking Plugs.

Rex Mnndy, who drove a sidecar outfit in the Six Days Trials, and who was awarded a gold medal and a fuel prize, used K.L.G. plugs throughout.

Change of Address.

Messrs. The Palmer Tyre, Ltd., inform us that their Leeds depot is being transferred from 54, New Briggate to York Road, North Street Corner, Leeds.

Beldam Tyre Prices Increased.

The price of all tyres manufactured by the Beldam Tyre Co., Ltd., will be increased by 10% as from the first of the present month.

Tyres in the Johannesburg-Durban Race.

In the famous Johannesburg-Durban motor cycle race, which was revived this year, we are told that out of the fifteen machines that finished, the first, second, fourth, and eight others were fitted with Bates tyres.

A Waterproof Plug.

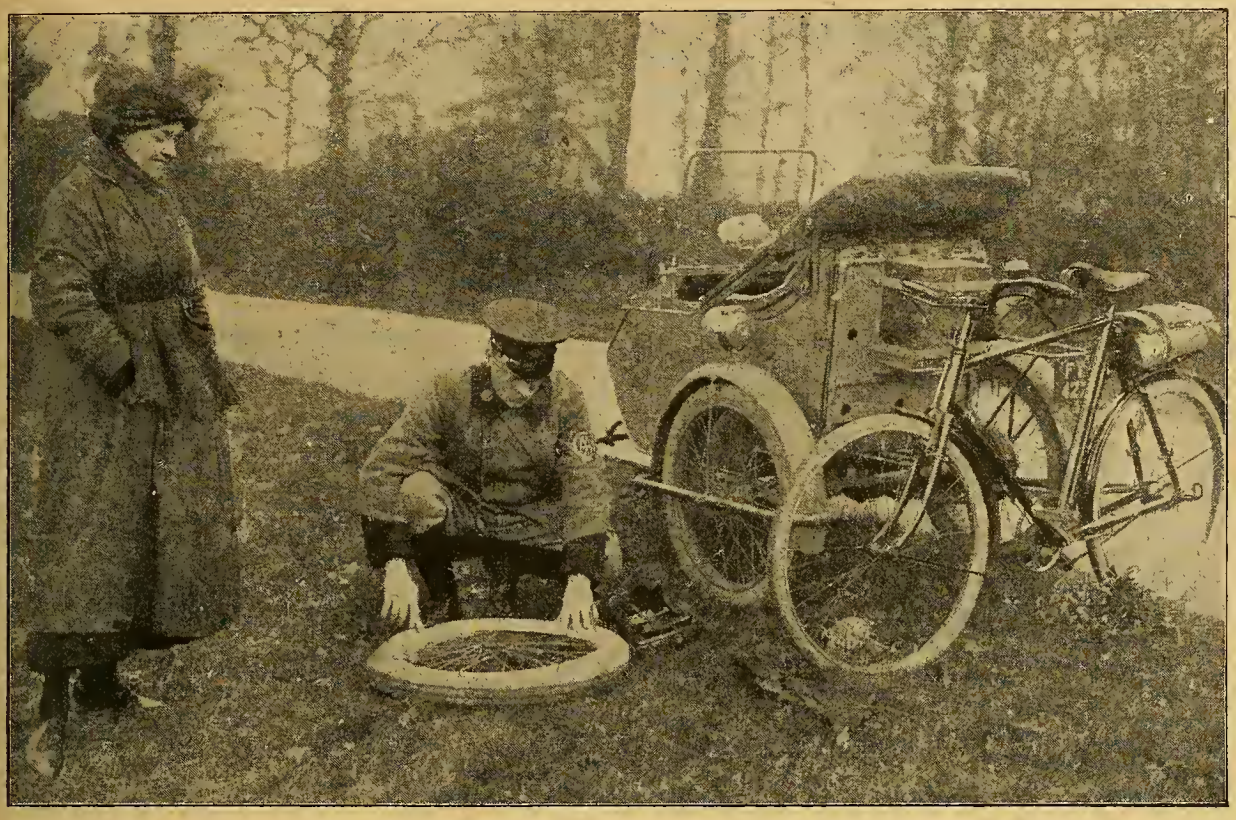
Many riders will be interested to hear that for wintry work a specially protected plug is marketed by the Forward Sparking Plug Co., of Summer Row, Birmingham. The feature of the plug is its waterproof cap, which effectively keeps out rain, mud, and damp, and leaves no terminals exposed to cause short circuits. The cap can be instantly detached for testing the spark.

500 c.c. Machines in Scottish Six Days.

Messrs. Phelon and Moore, Ltd., recently announced that the P. and M. was the only machine with an engine under 500 c.c. to complete the Scottish Six Days Trials without loss of marks. They wish us to state, however, that the performance of J. A. Newman, who rode a 3½ h.p. (500 c.c.) Sunbeam, was inadvertently overlooked. Newman also completed the course without the loss of a single mark.

Tyres in the A.C.U. Six Days.

It is always interesting to note statistics in connection with motor cycling competitions. Of the Six Days starters, 55% pinned their faith to Dunlop rubber-studded tyres, the remainder being divided between a number of other makes. The team prize (B.S.A. team) was secured on Dunlops, second place (Scott team) on Palmers, and third (Rover) on Dunlops again. A machine of the latter make also won the Welsh cup on the same tyres. Twenty-two gold medals were awarded: fourteen machines fitted with Dunlops (63.63%), six Palmers, and one each Avons and Goodyears.



THE DANGER OF DELAY.

What "waiting until next year" means to potential A.A. members.

The following extract is taken from a letter received recently by the Automobile Association :—

"I thank you for the booklet which I have read with interest. The service which is offered by your Association is excellent, but, as I shall not be doing much motoring after the end of this month, until next Spring, I think I will wait till then before joining"

When it is remembered that the work of the Association is carried on throughout the year ; that subscriptions run for twelve months from date of joining, and that a single motor trip without the A.A. badge is an avoidable motoring risk, the unwisdom of such a decision will be realised by others, as it was by the writer of the above letter, when his attention was drawn to it.

Membership of the A.A. alleviates such motoring risks as :—

Unecessary delay due to a breakdown, lack of motor fuel, spares, etc. The khak.-clad A.A. patrol will render invaluable help in any of these emergencies.

Charges under the Motor Car Act. Under the Free Legal Defence Scheme, A.A. solicitors will represent you in any police court in the United Kingdom, saving you pounds in travelling expenses and, probably, a day's business loss.

Foreign Customs Dues. If a member of the A.A., you can take your cycle into a 70 per cent. tariff country on a banker's indemnity alone, and without depositing hundreds of pounds in customs dues.

"Taking the Wrong Road." Detailed itineraries of routes throughout the United Kingdom, together with accurate guide cards of all the larger towns, are supplied free to members on request.

Buying a "Dud" Cycle. Qualified engineers advise on the choice of cars and motor cycles, and report upon motor vehicles, new and second-hand, offered to members.

Unsatisfactory Hotel Accommodation. The A.A. Handbook, issued free to members, contains a list of all the A.A. officially appointed Hotels throughout England, Scotland, Ireland and Wales.

In addition, membership of the Automobile Association secures free use of the Roadside Telephone Boxes, Mechanical First-Aid Cycles, Special Insurance Facilities, etc., etc., and it is to the personal advantage of every motorist who is not already a member to become one without delay.

Write to the Secretary, The Automobile Association, 21, Fanum House, Whitcomb Street, London, W.C.2, for a free copy of the booklet, "The Key to the Open Road," which contains full particulars of all A.A. benefits and the objects of the Association.

Motor Cyclists in London are invited to call at Headquarters where a staff of experts is always in attendance to give information on any question relating to motoring.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½%. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

A.B.C.—Caffyns, Ltd., Eastbourne, distributers for Sussex, are booking orders for earliest deliveries. [0016

WAUCHOPE'S

9, Shoe Lane, Fleet Street, London.EC4.

For square deals and Values....

Easy terms of payment taken in advance for new 1920 models. Motor cycles or sidecar combinations of any leading make supplied. Payments can be made now to suit own convenience. Should one half the total amount be remitted before the new machine on order is delivered, the outstanding amount unpaid could then be received in twelve equal monthly instalments. We propose charging a small commission not exceeding 7½% on the outstanding amount unpaid. This arrangement ensures very easy terms and should greatly assist the new beginner who has decided to secure a new 1920 machine. No commission whatever would be charged if settled for before delivery. Prices to be those ruling at time of delivery.

BOOK NOW FOR 1920 MODELS.

Machines supplied strictly in rotation. There is no certainty that deliveries will not be crippled, and the demands for 1920 are certain to exceed those of 1919. There is no responsibility in booking, but you secure preference in delivery and an opportunity to pick up your machine when required. We take good second-hand machines in part payment for new models.

WAUCHOPE'S

invite enquiries for particulars of stock of second-hand light cars—cycle cars—motor cycles, and sidecar combinations.

REPAIRING

"Elite Holdtite Rivetless Soles."

Soles STUCK ON.

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdtite Sol-fix solution. **We guarantee them to hold as firm as rivets or sewing.** This process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof.** Full instructions given with each pair of soles.

Motor Cycle Noises and the Public.

WE have referred to the subject of motor cycle noises before, and doubtless shall do so again, for the only method of driving home the importance of a subject is by repeated reference to it. To the rider noisy valves or any unnecessary noises in the engine—for instance, the tap caused by a loose piston or bearing—are far more irritating than the sound of the exhaust, but it is the latter which is most abhorred by the public at large. The general hum made by a car, combined with the noise of steel-studded tyres on the road, does not force itself upon the attention like the staccato bark of a well-tuned but inadequately silenced single-cylinder motor cycle.

The tester rarely speaks of the noise of his machine: general tune is his greatest concern. The designer's aim in life, too, is advancement in efficiency, and it is rare to hear him discourse on the question of noise. Familiarity in both cases has bred contempt.

It is left to the public to breathe their caustic comments on noisy motor cycles. It is noise that irritates the public; noise, and not speed alone, that has caused magistrates to inflict vindictive fines and give vent to satirical censure when a victim is brought before them; noise that has hindered, and will hinder, the hypercritical man from buying sidecar outfits.

Is Silence a Danger?

This may sound unduly condemnatory, but it must be admitted as the truth. Frequently it has been stated that silent motor cycles would be dangerous on the road, but such assertions are almost ridiculous, even though there may be grounds for the contention. To concede that there may be different qualities of noise and that some motor cycles are noisy but not objectionable may be easy and reasonable. A discourse, however, on the quality of noises would need more space than is available here; every motor cyclist knows what is meant when we speak of noisy machines.

A badly silenced single-cylinder is undoubtedly the worst offender, but a twin engine, even if fitted with a silent exhaust, can make its presence very much heard by bad valve clatter, swish of chains, and the drumming of gear case and mudguards. It must be admitted, however, that the type of machine which needs most attention is the one that has been the means of the motor cycle industry attaining the prosperity it has attained—the single-cylinder. It's reliability is unquestioned, just as unquestioned as is its noisiness, and, in qualifying the latter statement by admitting that there are one or two quiet singles on the market, so is the general condemnation justified. Single-cylinders *can* be made efficient and at the same time reasonably silent. Then, why are they not? If one firm can turn out a single-cylinder chain-driven machine with an effective silencer, noiseless valve gear, and transmission chains that do not sing, then others can do so.

Public Toleration.

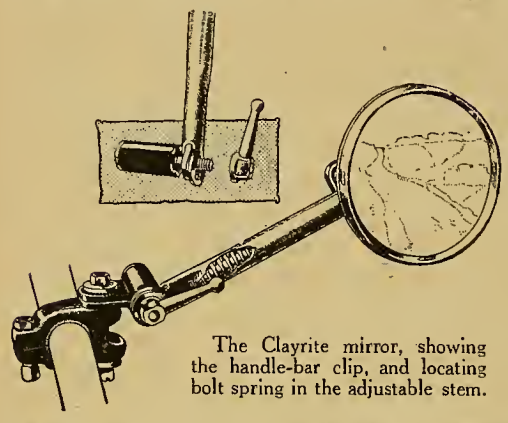
Although the country as a whole realises that it owed a great deal to the motor cycle during the war and tolerates now with fairly good humour the frequent imitations of machine gun clatter in the street and on the roads, the public may not always be so tolerant. Next year there will be many thousands more motor cyclists abroad, and every maker should consider *now* the question of silencing his particular machine to the utmost degree possible. It can be safely asserted that legislation is more likely to be directed to noisy motor cycles than to noisy lorries, although comparisons of the discomforts caused by both are ridiculous

But, quite apart from the nuisance to the public caused by the racket of exhausts, the fact that a quiet machine is infinitely more pleasurable to ride should alone induce manufacturers to give the question more attention than they have been doing up to the present time.

An Index to the advertisements in this issue will be found on the page facing the back cover.

THE CLAYRITE HANDLE-BAR MIRROR.

A NEW firm in the accessory branch of the industry is Messrs. Clayton Wright, Ltd., who have registered offices at 5, Corporation Street, Birmingham, and if the quality of their first speciality is any criterion, they evidently intend to produce only the best class of fitting.

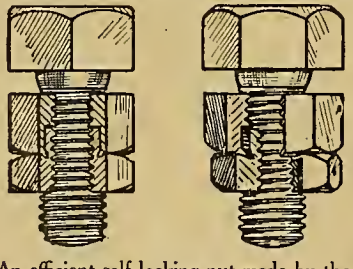


The Clayrite mirror, showing the handle-bar clip, and locating bolt spring in the adjustable stem.

We have before us an exceptionally neat and soundly constructed handle-bar mirror, which is to be known as the Clayrite. The finish is nickel plate and dull black, and it has a clip suitable for handle-bars of either ⅞in. or 1in. diameter. The back bracket of the mirror permits its adjustment in any desired position on the stem, while the latter may be placed in any one of five different positions (relative to the attaching clip), in each of which it is held rigidly by a positive locking device. This adjustment is effected without the use of tools, being obtained by means of a form of spring bolt operating in slots milled in the lug which supports the stem. The Clayrite mirror is to be sold at the moderate price of 11s. 6d.

THE ROSS LOCKNUT.

IN consequence of a remark made by "Ixion" in our issue of August 21st last, the Ross Locknut Co., Billiter Square Buildings, London, E.C.3, sent round a representative to explain the Ross locknut. There seems to be little doubt that this fulfils the purpose for which it is intended. It consists of a nut within a nut, one shallow and one of standard size, an extension on the flat nut being spun inside the other. The holes through both are slightly eccentric, and when the bottom nut has been screwed home it is only necessary to give the top one a quarter turn, when it is firmly locked. Its gripping powers were illustrated by two unthreaded nuts slipped over a piece of steel bolt. If the shallow nut is turned clockwise, it locks on the smooth bolt so securely that it cannot be turned or moved.



An efficient self-locking nut made by the Ross Locknut Co.

Both portions of the locknut have guide marks stamped on them, and when the nut has to be removed these two are brought opposite each other. The only tool required to fit this nut is an ordinary spanner. The chief advantage is that it does not damage either its own thread or that of the part on which it is screwed. Ross locknuts are made in all sizes and in all standards.

A SIDECAR CAB.

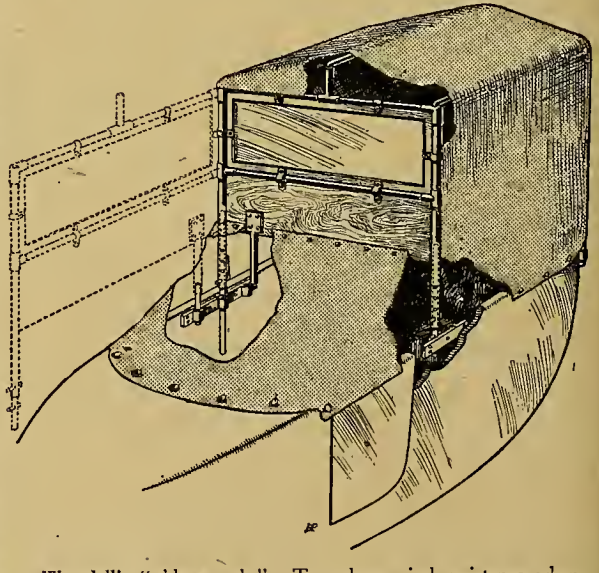
THE increase of pleasure-motor cycling during the past season has brought along quite a number of appliances for enhancing the comfort of the sidecar passenger, chief among which are the several windscreens now on the market. Probably quite 50% of sidecars now on the road are fitted with some form of screen, and quite a number have hoods also. Such equipment greatly adds to the comfort of sidecarring, and passengers who once have had these comforts will always demand them when the mount is changed.

Many makers, however, do not fit hoods and screens as standard equipment, and for some time to come there is every promise of success for those who market such equipment as accessories.

With this in mind, Mr. H. Worsdall, 102, Lady Pit Lane, Leeds, has designed what he terms a sidecar cab, which consists of an adjustable screen and an easily fitted hood.

The screen utilises only a small sheet of celluloid, in order that the cost of renewal is kept low. This screen is fixed in a wooden frame mounted in a tubular member, which is carried in a vertical position and is adjustable as to height. Below the window there is a panel of three-ply wood or metal, and the space between it and the forward end of the well is provided with an apron. The uprights are supported in sockets fixed to the side of the body, and by lifting the outer tube the driver may, without dismounting, swing the screen round to allow the passenger to enter.

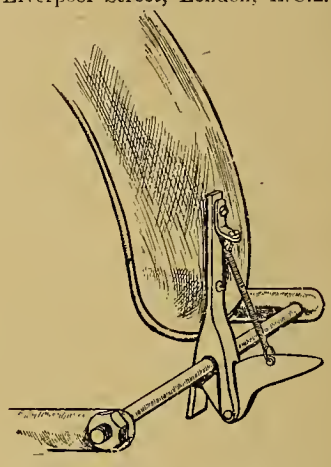
At the back of the body three sockets are fitted to carry upright tubes which connect with the screen frame by other tubes over which the hood is "stretched." When not in use, these tubes and the hood roll up together in a very compact form convenient for carriage.



Worsdall's "sidecar cab." To reduce wind resistance when riding with an empty sidecar the screen may be fixed, as shown in dotted lines.

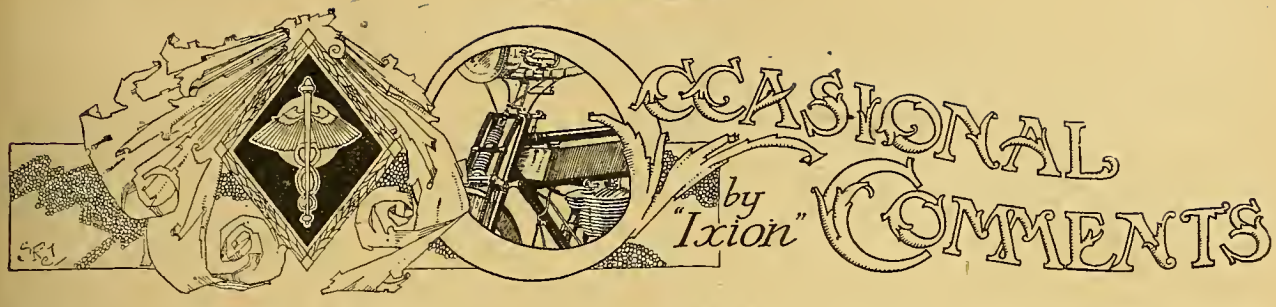
A USEFUL MOTOR CYCLE STAND CLIP.

A SIMPLE, well-made, and ingenious stand clip has been brought out by the London Engineering Company, 25, Liverpool Street, London, E.C.2. It locks the stand securely, is quickly engaged, and is as easily released. It is claimed that it will fit any motor cycle and does not damage the mudguard; it is said to be impossible for this stand to fall down through road vibration.



A readily-operated stand clip.

The device is worthy of commendation as a departure from the orthodox clip, composed of fierce and vice-like strips of strong spring steel. This arrangement is so designed that only the lightest possible spring is necessary for its correct action.



Speedman's Wobble.

NONE of our correspondents have really *explained* speedman's wobble in response to the invitation by "G.E.S.," though several readers have answered his letter. They are perfectly right in saying it is folly to whack an unfamiliar machine up to 65 m.p.h., especially upon our war-shattered roads. But they have none of them accounted for the phenomenon which attends such folly. The problem offered them may be restated as follows: When a motor cycle is ridden at very high speeds, it is apt to depart from the rectilinear track, and to inscribe a wheelmark on the road roughly resembling a gigantic corkscrew pulled out just short of straight. This wobble is often invincible. The radius of the elongated spiral steadily increases until at last the rider is flung. In certain cases control cannot be regained by applying the brakes or shutting the throttle. In other words, the situation is rather reminiscent of a spinning aeroplane. So far as a remedy is concerned, I know of none, other than to avoid such speeds on surfaces which are not true, *i.e.*, to reserve track speed for the track. The development of the wobble may usually be prevented by bracing wrists, back, and legs so stiffly that the front wheel is rigidly held true. Should the wobble develop, the only hope seems to rest in *gradual* reduction of speed, whilst muscular strength restricts the machine to such an approximately straight track that it remains steerable. Certain makes of machine are peculiarly liable to this dangerous habit; and tyre pressures appear to affect its development.

Bad Steering and Tyre Pressures.

I HAVE recently made several references to the unsatisfactory steering design of certain machines which have passed through my hands. I have since had reason to suspect that we bring trouble on ourselves by carelessness about tyre pressures. Quite accidentally I converted the worst steerer of the bevy into a good steerer by riding it with a softer back tyre. Apparently, whenever the back tyre was board-hard, the tail of the machine bounced heavily and cast an illegitimate leverage on the front wheel, thus deluding both the owner and myself into fancying that the frame was out of truth, or the forks bent, or the steering badly designed. Of course we motor cyclists are tolerably careless about tyre pressures. We do not use gauges as the careful type of car owner will do. We kick the cover, or press a careless thumb into the tread, let a little air out if the machine is bounceable, pump a little more in if we feel the road too acutely. But whether our tubes are blown up to 40 lb. or 70 lb. per square inch, motor cyclists as a class neither know nor care. Spring frames have made me exceptionally careless in such respects of late. The necessity for trying many new machines, which are quite unpardonably fitted with rigid frames, has now led me to pay a novel attention to tyre pressures; and I am learning—or relearning—a lot. Chief amongst my discoveries is the fact that a very slight variation in tyre pressures has a marked effect upon light and easy steering. I intend to make special experiments towards ascertaining whether tyre pressures affect speedman's wobble. So if next week's *Motor Cycle* comes out with a black edge and my photograph, you will recognise that I died in a good cause.

The Chain Shortage.

I HEAR that so many machines are under construction that most of the chain manufacturers have four or five times the number of orders which they were accustomed to in 1914. Spares are practically unprocurable, even in such small items as odd links. Most of the factory replacement departments are devoid of stocks, and a leading chain manufacturer has offered as a special favour to supply my own modest requirements in three months' time. Wherefore, I counsel users whose chains are growing ricketty to give the old ones every attention, and to place their orders in good time.

Failures on Hills.

MUSING over the hill failures in the A.C.U. Trial, I reflected what hill stops I had personally sustained this year. Let it be prefaced that I have repeatedly climbed practically every famous or infamous hill in England, Wales, and Scotland on all sorts and dates of machine. I can recall three hill stops this year. One of them at a Y bend, when I intended to take the left-hand road, and found I had to tackle the other: I was on top gear, and by the time I had lugged the bicycle round and changed down, the machine was stationary and I stopped the engine. Another on a plain straightaway hill, when my sleeve caught the ignition lever and retarded it fully; for a reason which is not to the present point, the magneto in question did not spark on full retard, and, before I knew what had happened, the machine had stopped. The third failure occurred on the kind of hairpin which Mr. Loughborough adores. To be quite honest, I was showing off; as there were spectators present, and I was not a competitor, I ought to have come down to bottom gear and crawled; but, having climbed millions of hairpins of this villainous type, I remained on second gear and charged. My front wheel hit a big stone, and in a tenth of a second I was broadside on across the road, and had to shut off to avoid ramming the bank. These incidents are typical of the causes which lose men medals in modern reliability trials, though none of them actually befell me while riding in a competition.

DISC WHEELS ON SOLO MACHINES.

Readers' Opinions For and Against.

IN our issue of September 11th we invited readers to submit their opinions on the effect upon steering solo machines fitted with disc wheels in a wind. These opinions are by no means unanimous either in favour or otherwise, but most of our correspondents agree that steering is in some degree affected. Several writers contend that it is possible to become accustomed to the effects upon the steering. On the other hand, it is suggested that the nervous solo rider will experience some difficulty. Generally, it may be said that only high winds cause inconvenience. It is unfortunate that high winds are most common at a time when the advantages of disc wheels should be most apparent, *i.e.*, when wet weather and muddy roads are encountered.

One correspondent advances the somewhat startling theory that a side wind tends to bring a machine into the wind, and so assists in righting the balance. On the face of it this appears to be doubtful, as the greater part of the wheel is in front of the line drawn through the centre of the steering head to the ground, and therefore a side wind should tend to turn the wheel away from the line of travel. The interest lies in the fact that this reader has noticed the tendency, and this suggests that it is a case where some other agency is at work. On this point it would be interesting to have other views.

Below we give a selection of the letters received:

A New Theory.

Sir,—Three months ago I had discs fitted to my 4 h.p. Sunbeam machine by the Ace Disc Engineering Co., of Coventry, and have since done about 1,200 miles, using the machine daily, on a terrible road, for business. They add much to the good looks of the machine, and reduce the time required for cleaning by one half, for greasy hubs and spokes are next to uncleanable, and are really an eyesore.

Against the many advantages there is only one disadvantage, in my opinion, and that is the added weight of steel discs, which might tell on a very light machine; but I think it is not worth consideration on a Douglas or any machine of 3 h.p. and over.

As a trial run after having discs fitted I went from Newcastle to Keswick, *via* Alston, Penrith, and Hartside, with a very strong and gusty wind blowing from the South (consequently on my left) the whole way, doing the journey comfortably in four hours. At the start of the run at one or two corners I felt a tendency for the front wheel to turn *into* the wind, which at worst could only assist in righting the balance.

A steady side wind did not trouble me in the least, as I rode in many places for several miles with one hand off the bars for a rest. After I had covered about twenty miles I forgot all about discs and wind effects through use, and came to the conclusion that with discs fitted windy weather does not incur the least danger: it merely affects the machine in a slightly different manner from a machine without discs, and this is quickly got used to, especially when riding a heavy machine. I had never ridden a machine with discs fitted before, and must admit that, even under the adverse weather conditions, I was perfectly at ease the whole way. The return was made *via* Kirkstone Pass, etc., in the same wind.

May I remark, finally, on the excellent attention I received from the Ace Co. and the thoroughness of its work? I sent the firm three wheels to fit, and asked for them by fourteen days. I was on my way to Keswick on the 15th, and have had absolutely no trouble since fitting.

With a light sidecar fitted the wind effect is practically nil.
Sunderland. W.H.D.

Not for the Nervous Rider.

Sir,—Apropos of your request for experiences with wheel discs on motor cycles, may I mention mine?

I own a 1919 4 h.p. countershaft Triumph with an extra large engine sprocket. I have aluminium discs fitted, and have used them for four months, almost daily, on very fast, long distance runs, with spells of town work—all solo.

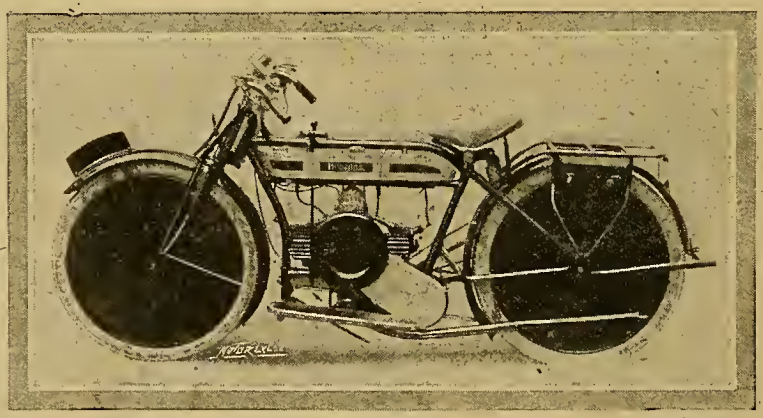
The chief points, in my opinion, are as follows:

FOR.—(1.) Ease of cleaning. (2.) Smartness and "finish." (3.) Nothing can pass between the spokes, thereby eliminating a source of accidents.

AGAINST.—(1.) With touring bars. *Dangerous* in gusty weather and high winds, especially on light machines. (2.) Difficult oiling of wheel bearings. (3.) After several months' usage, when spokes become loose, etc., the spokes, being hidden, escape the usual inspection and eventually lead to trouble.

Wide bars are a *necessity* in anything but calm weather, and one is very easily capsized by a wind coming from a side street, broadside on, unless well on the *qui vive*. A nervous rider is well advised to leave wheel discs alone.

I, myself, shall have them fitted to all my machines in future, especially passenger machines. W. MYLAM.



Disc wheels on a Douglas lightweight give the machine a very smart appearance. The discs fitted are known as the Chelsea, and are fixed by means of five studs in recesses, a speciality of Messrs. Vivian, Hardie and Lane, Ltd., of Woodstock Street, W.1, who also supplied the aluminium chain case shown.

Getting Accustomed to the Steering.

Sir,—Seeing an enquiry in *The Motor Cycle* of the 11th ult. *re* experiences of the effect of wind on wheel discs, perhaps mine would be of interest. I have covered 2,500

Disc Wheels on Solo Machines.—

miles on my 1919 4 h.p. Douglas, solo, and with discs fitted. At first the steering was rendered decidedly awkward on windy days, especially when side gusts round corners were encountered. A side wind of sufficient strength produces a marked tendency to turn the front wheel, and a head wind holds the wheel still, rendering swerving difficult. However, I have now got quite accustomed to it, and seldom notice the effect of the discs at all.

Still, judging by what others have told me who have tried my machine, I should be in no hurry to lend it on a windy day to anyone who is not used to riding solo with discs.

I may say I consider the steering of my machine excellent, and under ordinary conditions exceptionally easy.

Haywards Heath. E.K.

On a Solo Harley-Davidson.

Sir,—Respecting disc wheels on solo machines or combinations, they are certainly a vast improvement in the matter of appearance, and wheel cleaning is much simpler. I always dreaded cleaning spokes and hubs.

As regards wind affecting the steering on a machine fitted with wheel discs, it certainly does, and a machine is very awkward to steer in a strong wind. In 1915 I fitted wheel discs to my solo Harley-Davidson, and, riding one day in a storm, I found the steering so bad, especially on one or two corners, where I nearly came a cropper, that I dismounted and took the front wheel disc off, and proceeded without any further trouble. Since then I have ridden with discs only on the back wheel. That is my experience of discs on a solo machine. C. F. WALKER.

Disappointed in Results.

Sir,—Seeing an article in *The Motor Cycle* of September 11th, I should like to express my experience on the above subject. I have a 2¾ h.p. Douglas, which I use daily for riding to and from my business, which is several miles from here (Newport, Mon.), and as the winter riding gets the machine in a very dirty state, I thought I would fit a set of wheel discs to save the labour of wheel cleaning.

I consequently obtained a set of polished aluminium discs of a well-known make, and had them fitted, the result being that they affected the steering. What they would be like in the very bad and rough weather I should not like to hazard an opinion.

I was very disappointed with the result, and have since had the discs removed for safety sake. F. T. PHILLIPS.

The Experience of a D.R. in France.

Sir,—Perhaps the following facts may be of interest to you with regard to the discussion as to the advisability of fitting disc wheels.

While serving in France as a despatch rider with the R.A.F., I fitted discs to my P. and M., but found that when riding solo, if there happened to be a strong side wind blowing, it was very hard to keep a straight course. In whichever direction the wind was blowing, so it carried the machine. When it happened to be a head or following wind, I noticed no difficulty whatever in steering

When using a combination the same difficulty in steering was noticeable with a side wind, and speed was also very much affected. More so in the case of a combination than solo, as there was more wind resistance in three wheels compared with two.

The great advantage, of course, with discs is that your hubs and races are kept clean and dry, whereas, without, constant packing with grease is necessary, otherwise water and grit are bound to find their way in.

In view of the fact that the steering put such a strain on my wrists, I discarded the discs.

I have not used discs in this country, but should not think the same amount of trouble with steering would be so apparent, because our roads are sheltered by so many hedges, trees, etc., whereas French roads are completely exposed.

FRED U. MUNDY.

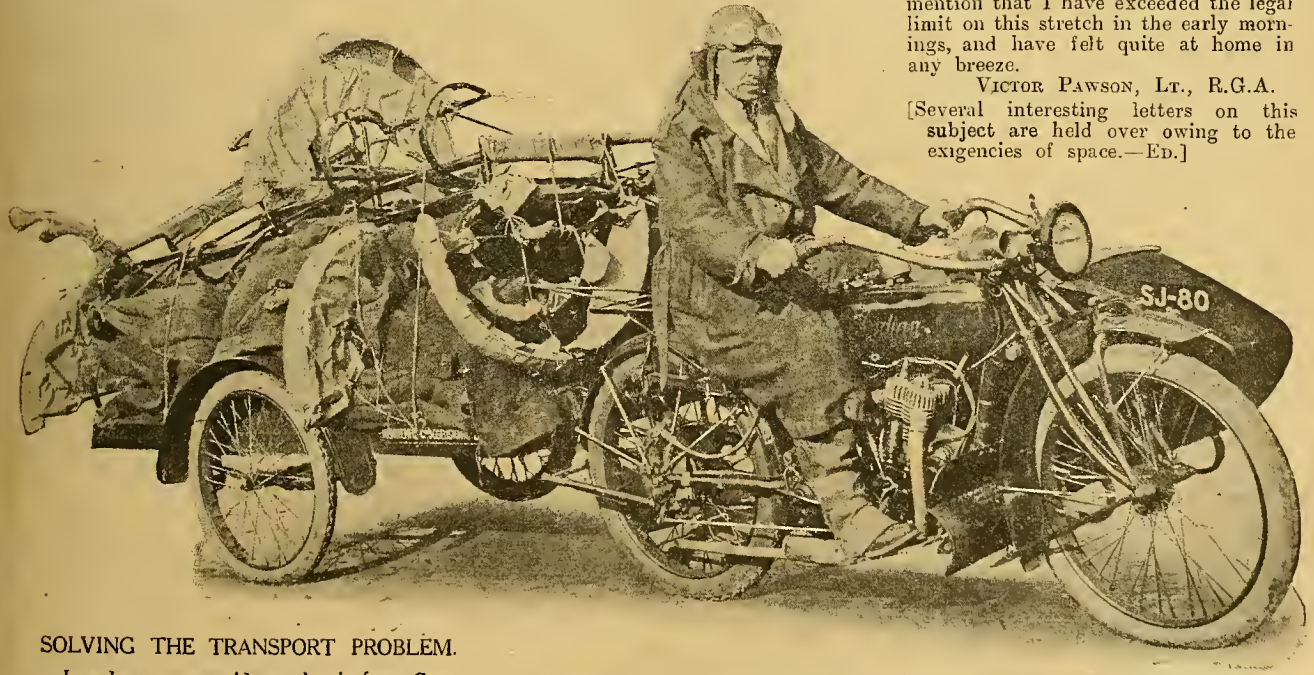
An Opinion from Malta.

Sir,—I see in a recent issue of *The Motor Cycle* that you invite any of your readers to state their experiences of disc wheels as fitted to solo mounts.

Well, shortly before leaving England, I repeatedly rode my T.T. Indian along the straight coast road from Worthing to Brighton, and, as no doubt some of your readers know, some fairly stiff breezes are encountered along there. At places the road is sheltered from the sea breeze, and it was upon coming from the sheltered part into the wind-swept portion that one noticed any difference between ordinary and disc wheels. The wind, I found, always had a tendency to cause the front wheel to assume a wobble, and it was only on my leaning my body and slightly tilting the machine into the wind that this was corrected. Of course, the wind came upon one in gusts and, personally, I have found that a stiff, steady breeze does not affect a disc-wheeled machine if the body is inclined slightly toward the wind. I may mention that I have exceeded the legal limit on this stretch in the early mornings, and have felt quite at home in any breeze.

VICTOR PAWSON, LT., R.G.A.

[Several interesting letters on this subject are held over owing to the exigencies of space.—ED.]

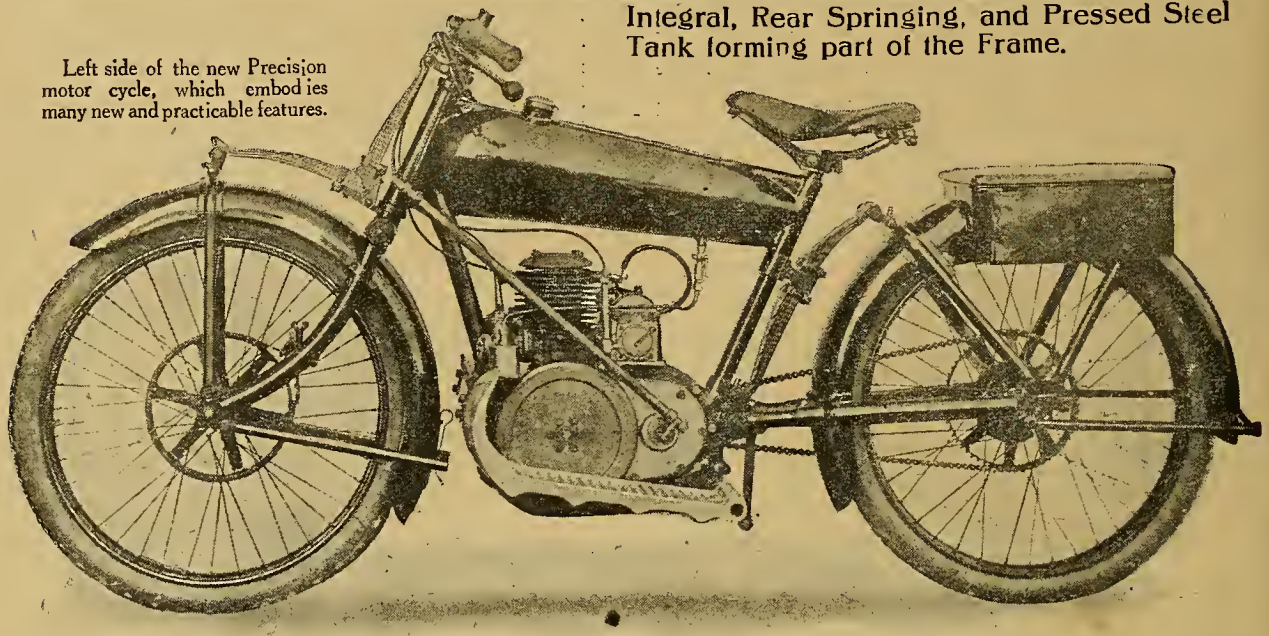


SOLVING THE TRANSPORT PROBLEM.

In order to convey sidecar chassis from Coventry to the London "Indian" depot, the above trailer was attached to a 1919 Powerplus outfit. Mr. E. Bridgeman is seen about to leave the City of Motors with a load of eight chassis, weighing altogether half a ton.

THE PRECISION MOTOR CYCLE.

An Unconventional Solo Machine, embodying 350 c.c. Two-stroke Engine, with Gear Unit Integral, Rear Springing, and Pressed Steel Tank forming part of the Frame.



Left side of the new Precision motor cycle, which embodies many new and practicable features.

ALTHOUGH we have known for some time that Messrs. F. E. Baker, Ltd., the makers of Precision engines, were experimenting with a novel design of complete motor cycle, we were not permitted to record this interesting fact until our issue of October 2nd. We may say we have watched the development of this design from its earliest stages, and are consequently in a position fully to appreciate the general idea behind the design.

Mr. F. E. Baker has often told us that he aspired to produce a motor cycle meeting his own requirements, which, he contended, would also find appreciation with a large number of potential purchasers who desired most of the comforts of a car combined with the undoubted advantages of the single track machine.

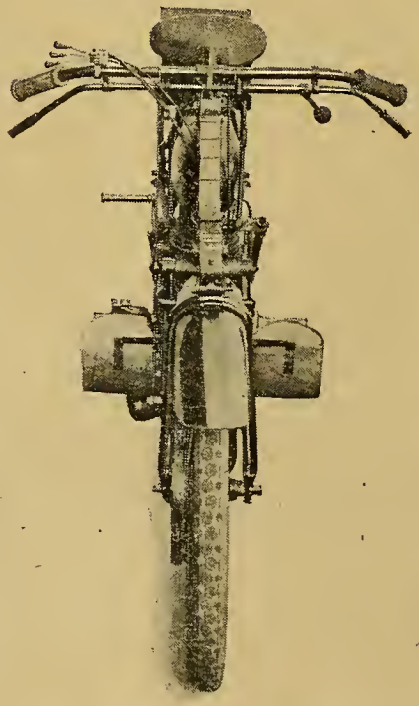
Mr. Baker has always been a motor cycle enthusiast, and for several years he has told us that, provided he could obtain the same comfort, as regards insulation from road shocks, as he had in a large car, he preferred the motor bicycle.

This first requirement meant a spring frame, which, taken in conjunction with other points considered to be essentials, was not quite so easy to design as its simplicity might imply.

Unconventionality.

Then other considerations were inspired by the road experiences of Mr. Baker and certain members of his staff on machines of all types. To produce a machine obviating the disadvantages and causes of irritation inherent with pre-war types was to be the aim. This, of course, was an engineer's ideal, but with these ideas on the one hand and manufacturing problems on the other, a very good compromise has been arrived at, which is a sound commercial proposition.

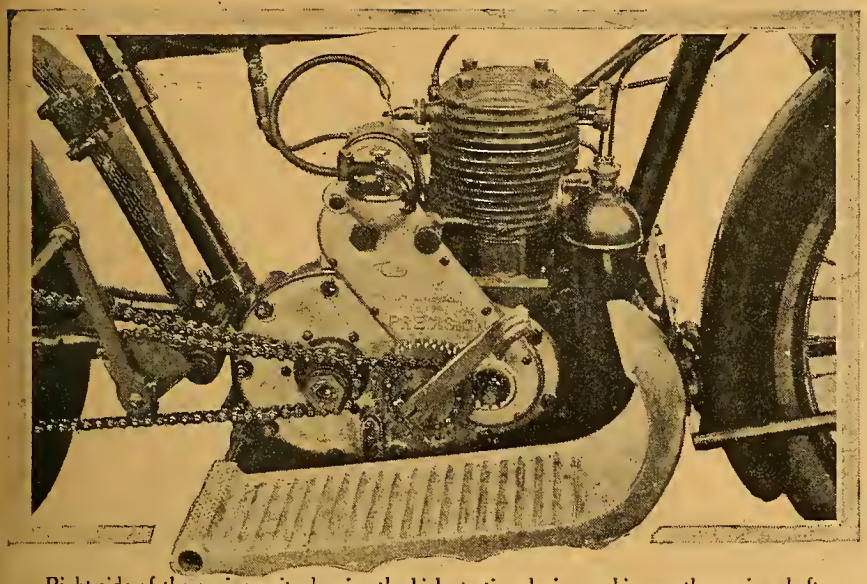
The new Precision motor cycle, while retaining the general outlines of the conventional machine, differs from it at almost every point, the main aim being to secure the essentials by the least number of units, with an entire absence of parts attached to the frame by clips. How far the designers have succeeded in this the reader will be able to judge from the illustrations and details of the machine which we are now able to give.



Front view of the machine. Note the roller lever system for operating the compression release and front brake and the short lever for changing gear

The Frame-tank Unit.

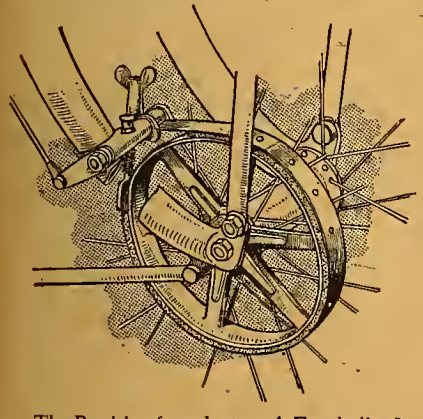
In the first place, the tank and mudguards form parts of the frame construction, and each is thus made to perform a double function. The tank is formed of two steel pressings, welded together, and takes the place of the two top girder tubes and detachable tank of the conventional machine, while the round section mudguards are made sufficiently strong to act as one of the sides in each of the triangulated wheel frames. While this is not the only instance of a tank being made integral with the frame, it is the first time steel pressings have been used in this manner. In building the frame, the head and front diagonal tubes are first welded together and then, with the seat tube, are enclosed by the two pressings forming the tank. The edges of the latter are machined before welding. For our especial benefit, Messrs. Baker had a stock frame cut through the centre in order that we might see the perfect joint so made, and we are able to give a photograph of these sections. It will be seen that such construction must be exceptionally strong without being unduly heavy. Two engine carrier lugs, another carrying the rear spring bracket, and the filler, are then brazed in their respective positions, and the main part of the frame is complete. The detail construction of the head and its bearings will be seen from the illustration on another page, the cups are pressed into position, but are renewable. The seat pillar is fixed by means of an expanding cone, similar to the almost general prac-



Right side of the engine unit, showing the kick-starting device working on the engine shaft and the pedal which operates the countershaft brake.

tice of fixing the handle-bars on first-class pedal cycles.

The present-day machine has frequently been criticised owing to cycle practice having been too slavishly followed. It is noteworthy that in the machine under review two points following cycle practice are embodied, which have either not been copied at all or copied but seldom in motor cycle construction. The first of these is the expanding cone fixing, just mentioned, and the second, the roller



The Precision front brake. A Ferodo-lined band contracts upon a 10in. drum.

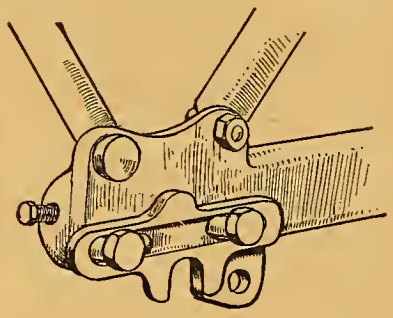
lever actuation of brake levers. These are the only points where the Precision follows previous cycle practice, and especially in the latter direction is the departure of interest, as it obviates the sharp bends usually present with cable front brake and compression release controls. Carried on a sleeve oscillating on the left hand lever, which operates the compression release, is another lever at right angles and fitted with a ball top. This actuates the gear change, and is sufficiently strong to be used for steering purposes while changing gear—a point which may be appreciated by the nervous solo rider.

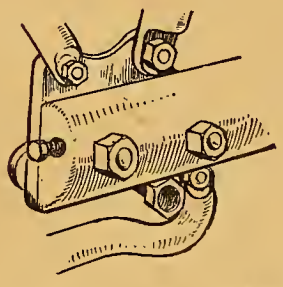
The Springing System.

Of the many springing systems reviewed in *The Motor Cycle*, the Precision design is one of the most simple. Both wheels are carried in triangulated frames, of which a portion of the mudguard in each case forms one side. The method of construction is good, and quite up to the work, perfectly rigid members being obtained. At one corner of the triangle the members are pivoted to the frame, the hub being at the second point, and the end of the spring at the third.

In the case of the front wheel springing, the wheel frame (or front fork) is pivoted to the steering tube by means of a long bracket fitted with ball bearings of the cup and cone variety. Immediately above this "joint," and forming part of the steering column, is the support for a V-shaped spring-saddle, to which the inner ends of the two-leaf springs are fixed by means of clips. This saddle is free to oscillate, and therefore gives the springs the same effect as would obtain were a single half-elliptic "cantilever" spring used as in the rear springing.

By this method the advantages of a long spring are secured in a compact form, and, in addition, the load is so distributed that heavy anchorages are not necessary. By an examination of the photograph, the reader will appreciate that, if a single longitudinal spring were used, the saddle would have to be fixed rigidly, and this would have to be extremely strong in order to withstand

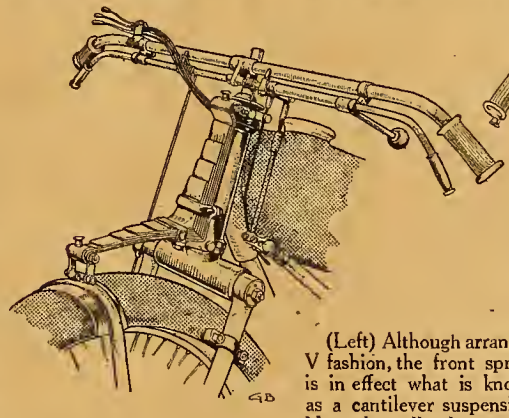


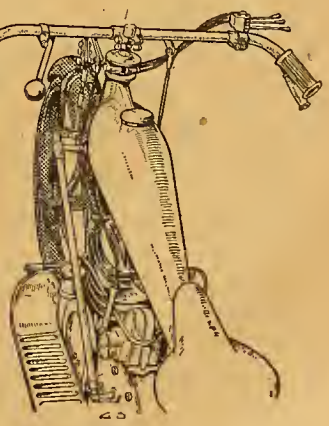


The rear fork end and sliding wheel carrier, by which the wheel may be removed without disturbing the distance between the chain sprocket centres.

the strains put upon it. The end of the two quarter-elliptic springs are shackled to the top of the steering tube and to the bridge on the mudguard, the shackle bolts being fitted with lubricators.

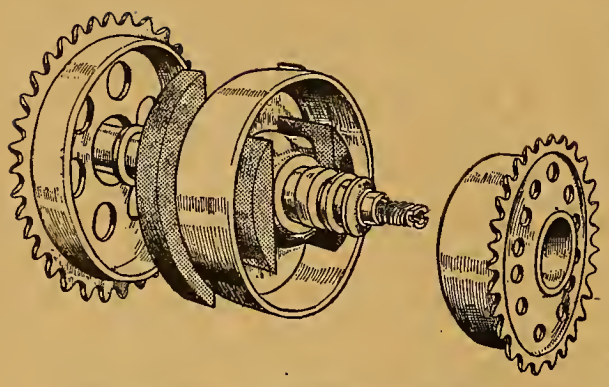
At the rear the springing is similarly arranged, but here a half-elliptic "cantilever" spring is used. The spring-saddle in this case pivots on a fixed member attached to the seat tube, and the lower and longer portion of the spring is shackled to the frame.





(Left) Although arranged V fashion, the front spring is in effect what is known as a cantilever suspension. Note the roller levers and front brake operating rod.

(Right) A rear view of the handle-bar and forward end of the pressed steel tank.



A perspective view of the gear unit, showing the segments which are expanded against the inner races of the drums connected to the two driven sprockets. The centre drum is the countershaft brake.

It will be seen that, apart from the shackles, there is only one oscillating part in each wheel frame, and as these are large bearings of ample dimensions, lateral rigidity is well provided. These bearings are capable of adjustment, but as the movement is so slight, and not to be compared in any way with the conditions prevailing in the case of a wheel hub, such adjustment should not be necessary very frequently.

The wheels fitted are 26 × 2¼in., and both may be dropped out of the fork ends in a vertical direction. The rear fork end particularly is worthy of mention, as the chain adjustment is entirely independent of the wheel fixing. This means that when the wheel is removed for any purpose it may be replaced exactly in the position it occupied before, the chain adjustment being undisturbed. This is obtained by the hub spindle being fixed in plates which slide on the fork ends, and are adjustable by draw bolts. The plates are secured by two bolts on each side, which are slackened off when chain adjustment is made.

Engine-gear Unit.

The 350 c.c. two-stroke Precision, which we described in our issue for May 29th this year, is more or less well known, and forms the main element of the power unit. This engine, it will be recalled, has a bore and stroke of 74 mm. and 81 mm. respectively, the capacity being 350 c.c., which makes it one of the largest single-cylinder two-strokes made at the present time.

In this engine there are several notable features, including automatic lubrication from a sump contained in the crank case casting, detachable head, and roller bearing big end. The new engine, however, embodies the countershaft within the base chamber, the transmission between the two being by chain on either side of the crank case proper, which is enclosed in the main casting. Chain adjustment is effected by two jockey sprockets, the bearings for which are mounted eccentrically and are accessible from the outside of the case, the flywheel having an aperture through which a special key can be inserted to adjust the sprocket.

The two chains drive sprockets which are free to revolve on ball bearings on the countershaft, which in turn carries, on the outside of the case, the small driving sprocket of the final transmission. Also fixed to the countershaft is the drum of the band brake, which takes the place of the more usual rear wheel brake. The band is of steel, anchored to a lug approximately on the centre line of the unit, and is actuated by a lever on a shaft to which, on the outside, is fixed a long pedal lever.

In principle, the gear is reminiscent of the old De Dion clutch, but is quite new in motor cycle practice, and probably unknown to the majority of motor cyclists. In principle, the gear is of the expanding clutch type, so that both gears are equally direct. The driven sprockets each carry a drum, against the inner faces of which are engaged, as desired, the clutch members revolving with the countershaft.

Expanding Clutches.

These clutches, consisting of two segments, are expanded by means of a rack running through the centre of the spindle and engaging with toothed wheels operating right and left-hand "jack screws." Provision is made for independent clutch adjustment, for which purpose the rack, which takes the form of a thread, is made in two parts, so that either may be rotated in order to give a worm and worm-wheel effect to the toothed wheels, and so open or close the clutch blocks. To prevent unintentional rotation of the rack, spring-operating plungers engage with flats on the side of the racks, and ensure the flats on each being in line, the threads of the two so mating that the joint between the two may pass either toothed wheel. The racks are held together by the actuating rod, which passes through the centre of both, balls being interposed between the nut on each end of the rod, and the outer end of each rack to form journal bearings to carry the rod and thrust bearings for the endwise movements. To effect adjustment, the parts are so proportioned that when either clutch is in operation, its rack protrudes from the spindle to allow of turning it by a suitable tool, and the amount it protrudes is an indication of the correctness of the adjustment.

The top gear of the machine at present is 4 to 1, on which ratio it is claimed that 50 m.p.h. has been attained, but probably a 5 to 1 ratio will be standardised.

As previously mentioned, the gear change lever is on the handle-bar. The actuation of this is quite simple, and merely involves slightly turning a diagonally disposed shaft extending from the centre of the countershaft to a support behind the lower ball race of the head. On the lower end is a small crank, which is connected to a toggle operating the rack engaging the worm wheels in the segment carriers.

The final transmission is by chain, which in finished production models will be protected by a guard. The difference between the respective positions of the countershaft and the pivoting point of the wheel frame is perhaps a little greater than is to be desired by the fastidious engineer, but is no more than is the case with the majority of spring frame designs, the ideal, of course, being to have the driving sprocket and the fulcrum of the wheel frame on the same centre.

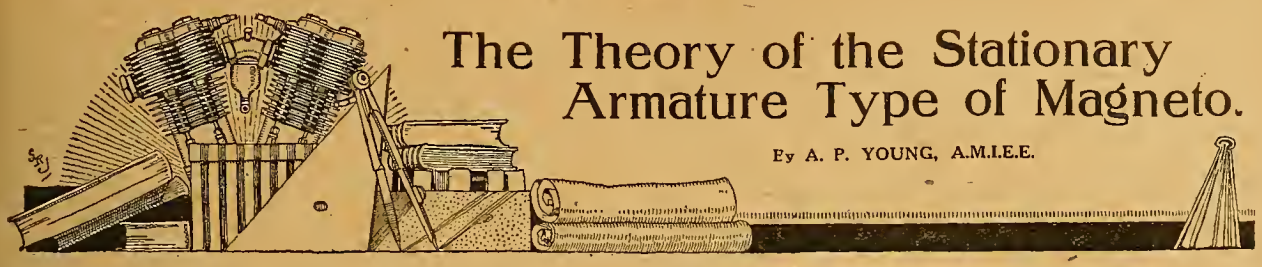
Other Notable Features.

Several other features are worthy of note, including the three lever fitting for operating the throttle, air, and magneto. For these three controls Bowden wires are used, the cables for which will be enclosed in a single tube.

Aluminium footboards of generous dimensions, a metal tool box with wooden lid integral with the rear mudguard, a Brooks B210 leaf spring saddle, and a large undershield form part of the equipment. The tank capacity is two gallons.

As regards its performance on the road, we await with interest an extended test, but from our five miles ride on it over rough and pot-holed roads we were very favourably impressed by its running and the efficiency of its springing. To those who have not ridden a spring frame mount, undoubtedly the extra comfort provided will come as a revelation and a new sensation in road transport. Probably it has only been the difficulty of providing a frame laterally rigid that has deterred many makers from abandoning the rigid frame. These difficulties appear to have been overcome in the Precision, and if, in the opinion of conservative motor cyclists, its appearance is not so graceful as perhaps it might be made, it must be remembered that designers who too closely study conventionality restrict their scope in bringing motor cycle design to finality.

For the especial benefit of *The Motor Cycle*, a frame was cut through the centre to reveal the construction. The above is an "untouched" photograph, and shows the perfect joints made by welding.



The Theory of the Stationary Armature Type of Magneto.

By A. P. YOUNG, A.M.I.E.E.

A Lucid Description of the Polar Inductor Magneto, in which the Windings do not Revolve. The Effectiveness of Laminated Pole Pieces.

IN a recent article on "The High-tension Magneto" appearing in *The Motor Cycle*, the theory of the rotating armature type of machine which is generally adopted on motor cycle engines was dealt with in a lucid and interesting manner. The main purpose of this article is to give a similar explanation of the working of the stationary armature type of magneto, to which the name polar inductor has been assigned by the writer.

A magneto with a stationary armature is no new thing, and a close study of the patent records of the past twenty years will reveal the interesting fact that in the very early days of the art, even before the familiar rotating armature machine had been perfected, the trend of magneto development (on paper, at any rate!) was in the direction of an inductor machine.

A British Pioneer.

Although the polar inductor magneto was first built commercially in America within the past few years, magnetos (of the low-tension type) were actually designed and constructed in this country some thirteen or fourteen years ago, by Dr. B. Murray, of the Albion Motor Car Co., and fitted to the engines manufactured by his company at that date. To Dr. B. Murray must go the credit of having first disclosed the basic principle (in his patent No. 14,737 of 1906) underlying the construction of the polar inductor magneto.

This form of magneto has not so far been seriously applied to motor car and motor cycle engines in this country, although during the war period it was used extensively on large multi-cylinder aeroplane engines having more than six cylinders. The B.T.H. Co. some two and a half years ago developed a magneto

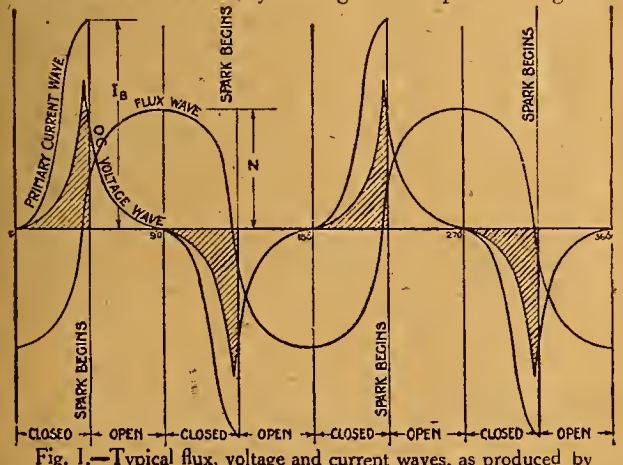


Fig. 1.—Typical flux, voltage and current waves, as produced by a high-tension magneto.

of this type, known as the type A.V., which has been standardised for use on most of the eight and twelve-cylinder aeroplane engines of British manufacture. This particular type of machine is designed to give four sparks per revolution, but the polar inductor principle is very flexible, and it is possible to build a magneto on these lines to give two sparks per revolution, corresponding to the orthodox two sparks rotating armature machine, or, on the other hand, a magneto can be designed to deliver six, eight, or even a greater number of sparks per revolution.

Every form of high-tension magneto has certain features in common, and these can be briefly classified as follows:

1. A magnet.
2. A laminated iron core carrying a primary and a secondary winding.
3. A mechanically operated contact breaker so designed that the primary winding is short circuited and open circuited at regular intervals, giving some

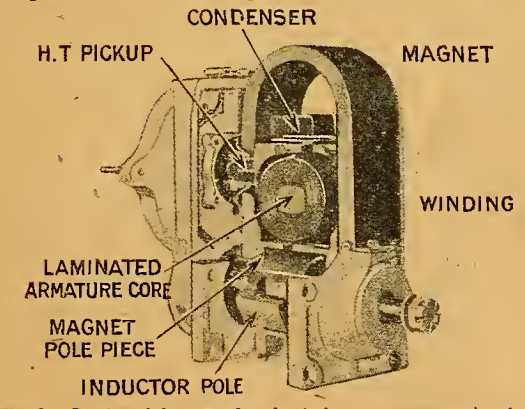

Fig. 2.—Sectioned four-spark polar inductor magneto, showing internal construction.

definite ratio between the period of short circuit and the period of open circuit.

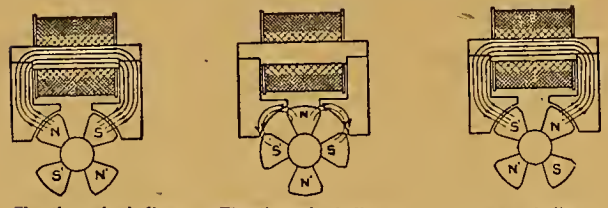
4. A condenser connected in parallel with the contacts for the purpose of wiping out arcing.
5. A high-tension distributing mechanism whereby the end of the secondary winding is connected to the particular sparking plug which will fire the charge, at the moment when the contacts separate, and the high tension spark is generated.

Basic Principles.

These features are embodied in every design of high-tension magneto, although the detailed construction of each component and their general arrangement in the form of a complete unit may be widely different. Apart from this consideration there is only one other

The Theory of the Stationary Armature Type of Magneto.—characteristic that may differ, namely, the method of generating an electric current in the closed primary circuit during the period when this winding is short circuited by the contacts. It should, of course, be understood that during this period, current gradually builds up in the primary winding as a result of the induced voltage produced by rotation, so that when the contacts are separated, a current of the order of four or five ampères is suddenly destroyed. The magnetic field associated with this current, which is interlinked with the large number of turns in the secondary winding, produces a very rapid "cutting" of the magnetic lines in suddenly collapsing, and thereby causes the voltage induced in the secondary winding to rise instantly to a very high value sufficient to initiate a spark at the electrodes of the sparking plug.

In the rotating armature magneto, the flux change in the armature core necessary to create a current in the closed primary circuit is produced by simply



Flux through windings, a maximum. Flux through windings, zero. Flux through windings, a maximum (reversed).

Fig. 3.—Flux changes in four-spark polar inductor magneto.

rotating the armature with respect to two fixed pole pieces. In the polar inductor machine, the armature core is fixed, and the flux change in it results from the rotation of a number of polar members which co-operate with fixed magnet poles on the one hand, and with the fixed laminated poles of the armature core on the other hand. For either construction the curves given in fig. 1 are typical. The flat-topped curve shows how the flux threading the armature core when the windings are open circuited is varied by rotation, thus giving us an alternating voltage in the primary winding which follows the peaky curve. The flux reaches the maximum value "N," and during the period when the primary is short circuited, the induced voltage generates a current which builds up in the manner indicated to the value "1B," this being the current broken by the contacts.

The Mechanical Details.

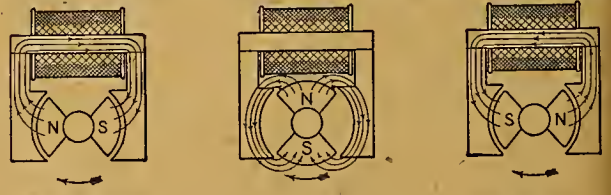
The general constructional details of a polar inductor magneto can be well understood by reference to fig. 2, which is a photograph of a B.T.H. type "AV" machine that has been sectioned. The rotating member comprises a straight-through shaft of non-magnetic nickel steel, which carries two inductors made of malleable iron. Each of these has two axial projections 180° apart, linked to a cylindrical boss which revolves with very fine clearance in the pole piece attached to one end of the magnet. Taking a sectional view of the rotor, therefore, as indicated in fig. 3, it is clear that there are four inductor poles spaced exactly 90° apart, these being alternately north and south.

In position 1, indicated in fig. 3, the flux from the north pole of the magnet flows through one of the corresponding inductor poles, across a small intervening air gap to one laminated pole of the armature core, through the armature core, back again to a south inductor pole, and thence to the south pole of the magnet. In position 2, after the rotor has revolved through 45°, the flux in the armature core is zero, whilst in position 3, corresponding to a further 45° movement, the flux in the armature core has reversed. Whenever the rotor takes up the position indicated in the middle diagram, the flux in the armature core is in process of reversing, and as this occurs four times in each revolution, there are in consequence four reversals of flux, and the design permits of the contact breaker opening and closing four times per revolution, thus enabling four high-tension sparks to be produced.

In the case of a machine designed to give two sparks per revolution, such as the type that has been developed in America for motor cycle work, there are two inductor poles only, and the laminated poles, fixed to the armature core, instead of being spaced 90° apart, are 180° apart. With this construction, the flux in the armature core reverses twice per revolution, thus enabling two sparks to be obtained, as clearly indicated in fig. 4.

Lamination of the Magnetic Circuit.

The construction of a polar inductor magneto permits of the thorough lamination of the whole of the iron circuit carrying the primary and secondary windings, and it is even possible to modify the design of the rotor so that the iron inductors can be laminated as well. The effect of thoroughly laminating the iron circuits through which the magnetic flux passes is to reduce the eddy current damping to a minimum, and in consequence the rise of the secondary voltage at "break" is particularly rapid. Ignition experts are now inclined to the opinion that one of the determining factors in the process of ignition is the rate of voltage rise in the secondary; and, other things



Flux maximum (positive). Flux reversing. Flux maximum (negative).

Fig. 4.—Flux changes in two-spark polar inductor magneto.

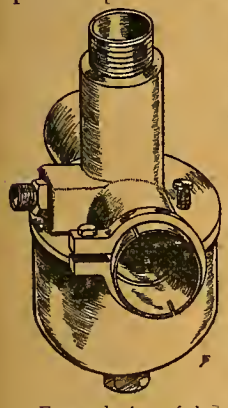
being equal, the machine that gives the most rapid voltage rise at "break," or, in other words, the steepest secondary voltage wave, will produce the best results from a purely ignition standpoint.

This feature of the polar inductor design has no doubt contributed largely to the great success that has been achieved with these machines in service on aeroplane engines. It should be pointed out, however, that in the latest designs of rotating armature magnetos now being built in this country, the solid cast-iron pole pieces, standardised by the Germans, have been replaced by laminated poles, with the result that the magnetic circuit for the flux is laminated almost as thoroughly as in an inductor machine. The electrical performance of this type of magneto has been greatly improved by this innovation that has been introduced by English designers.

The Mills Automatic Carburetter.

A One Lever Instrument with Adjustable Jet Float and Mixing Chambers Integral.

A CARBURETTER which dispenses entirely with the air lever is, if accurately designed, not only simpler in operation than the two-lever pattern, but is capable of providing approximately the correct proportion of petrol vapour and air most suitable for the engine at varying speeds. There is no doubt that the increasing number of single-lever carburetters goes to prove that this type is gradually coming into its own.

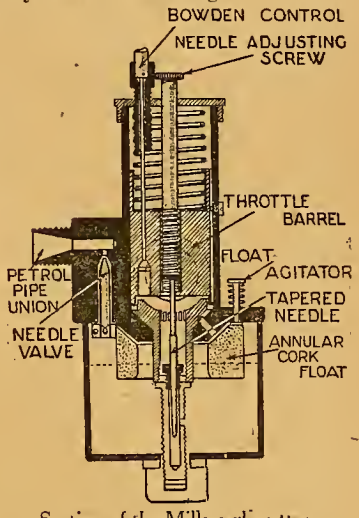


External view of the Mills carburetter showing the throttle slide removed

Simple in construction and provided with a variable jet which can be regulated whilst in the saddle, a single-lever carburetter has recently been produced by M. F. A. Mills, 19, Chalk Farm Road, Hampstead, N.W. The float chamber, located beneath the mixing chamber, considerably decreases the area usually monopolised by the conventional type of carburetter. The cork float at present employed is pivoted at one side on a small pin fixed to the body casting, which allows the float to rise and fall and at the same time withdraw a tapered needle, attached to the float lever, from a hole in the body casting connected with the petrol pipe, and consequently allow petrol to flow from the tank to the float chamber. At the base of the throttle barrel is a plug, curved in the centre to conform with the shape of the inlet pipe. Below this plug, through which five holes are drilled, the centre one to accommodate the jet needle, is attached a threaded brass tube, the lower end of which passes through a hole in the base of the float chamber and by means of a nut holds the latter in position. The hollow centre of this tube accommodates the lower end of the tapered needle, which, passing through the jet located above, permits the suction of the engine to draw a small quantity of spirit from the float chamber through a hole in the side of the jet tube, and out through the jet. The petrol is then drawn through the five holes in the base plug and, coming in contact with the air entering the mixing chamber, forms a gas which passes through the induction pipe to the cylinders. The cylindrical throttle slide is drilled and tapped in the centre, and accommodates the adjustable jet needle screw. The tapered needle is attached to the lower end of this screw, a small coil spring being placed below the screw in order to hold the needle in tension.

The tapered needle and throttle barrel showing how the needle is adjusted.

As the throttle slide is raised to admit a greater quantity of air to the cylinder, the needle is raised accordingly. The taper of the needle, however, is accurately turned, in order that a proportionately larger quantity of petrol may be liberated to mix with the air, and form the correct proportion of petrol vapour and air most suitable at various throttle positions. The Bowden wire attachment is located at one side, the nipple being inserted in a hole on the under side of the throttle slide. A return spring is placed between the slide and the milled cap screwed to the top of the throttle chamber. The tapered needle can be withdrawn from the jet with the greatest ease, by turning the milled head of the needle screw located on top of the throttle barrel, and consequently the mixture can be enriched or attenuated at any time while riding.



Section of the Mills carburetter.

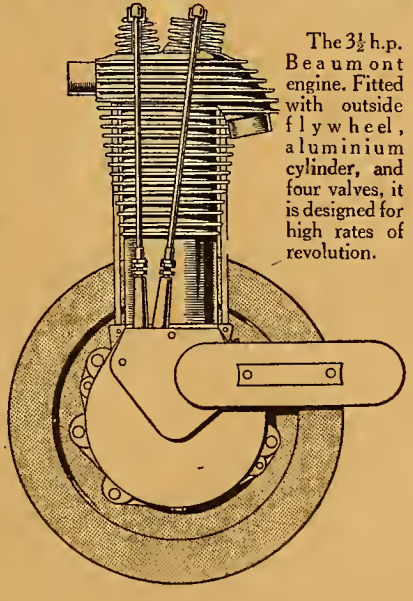
Our trial of the Mills carburetter on Mr. Mills's 4 h.p. Douglas was altogether satisfactory, notwithstanding the fact that he had an earlier pattern of vaporiser than that described here. Both acceleration and slow running were all that could be desired, while hill-climbing was highly satisfactory.

A High Speed Single Cylinder Engine.

The Beaumont Engine: Long Stroke (75 mm. × 113 mm. = 498 cc), Outside Flywheel, Aluminium Cylinder, and Four-valve Head.

THE influence of aero design is gradually extending itself into all branches of light internal combustion engineering, and many of those who came intimately in contact with aircraft engines during the war period are now crystallising their ideas in the shape of 1920 models.

Such a one is the designer of the 3½ h.p. Beaumont engine, which will shortly be incorporated in a motor cycle built by Beaumont Motors, Ltd., 78-82, Elland Road, Leeds. This engine is laid out on most modern lines with the object of obtaining the maximum speed from a unit of its capacity. An outside flywheel is employed, and the cylinder, which is fitted with a detachable head, is made of aluminium and contains a shrunk-in steel liner. The detachable head is also of aluminium, and has cast-iron valve seatings shrunk in.



The 3½ h.p. Beaumont engine. Fitted with outside flywheel, aluminium cylinder, and four valves, it is designed for high rates of revolution.

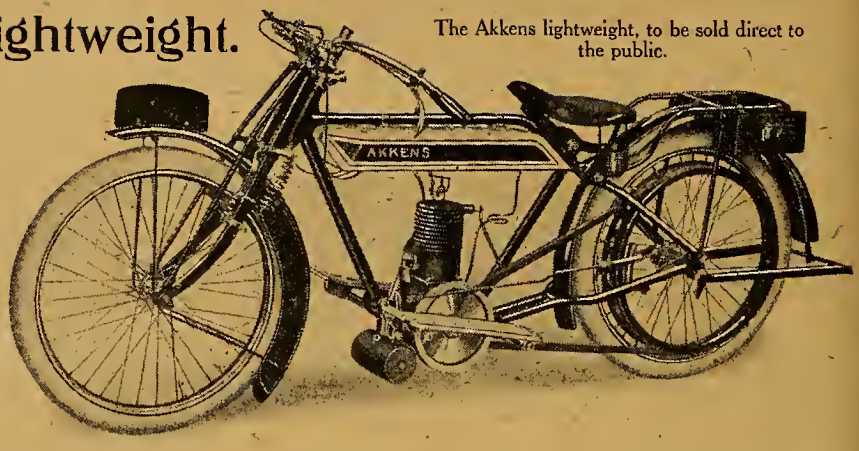
There are four valves per cylinder, all overhead, and the exhausts are inclined so as to provide the easiest possible exit for the gases. The head is interchangeable with a two-valve head, which is more suitable for ordinary road work. The use of the two-valve head necessitates the use of a cam of slightly different contour.

A decompressor is included in the timing case, and both valves are worked from the same cam. On the test bench the engine has proved itself capable of extremely high speeds, well over 5,000 r.p.m. having been attained. This result is, no doubt, due to the scientific lightness of the reciprocating parts, the connecting rod being of H section, suitably drilled, and the piston of aluminium of the Ricardo slipper type.

The engine will be built up in a light solo specification, and we look forward to its performance with great interest. The makers are also advancing well with their three-cylinder radial engine, which will shortly be incorporated in a three-speed solo lay-out of great attractiveness.

A Low-priced Lightweight.

The Akkens Two-stroke which will be Marketed Direct to the Public.



The Akkens lightweight, to be sold direct to the public.

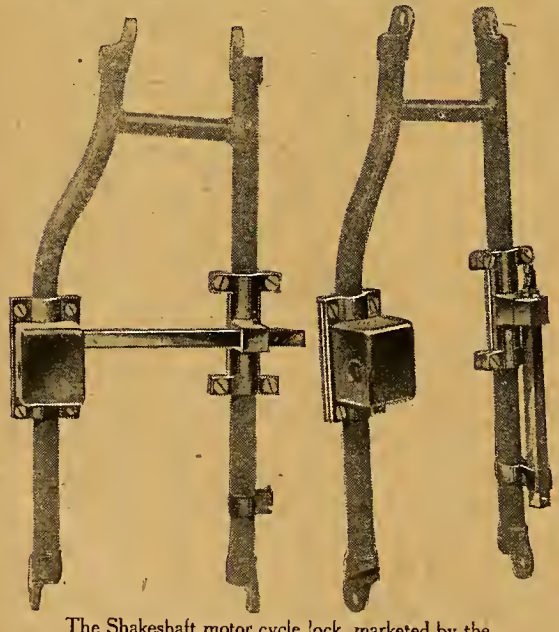
TO produce a motor cycle for sale direct to the public is perhaps a daring undertaking considering that throughout the development of the motor cycle industry the value of the "agent" as an intermediary has been recognised by the great majority of manufacturers. Notwithstanding, Messrs. Thomas and Gilbert, of Union Street, Smethwick, consider that, with manufacturing costs at present figures, there is an opening for a machine of good quality sold on the "cut price" principle direct to the user, and that there are sufficient potential buyers who prefer dealing direct to absorb their output of twenty-five motor cycles per week.

The "Akkens," as the machine is called, is built and equipped throughout in first-class style, the specifications including Druid, Brampton, or Saxon forks, Ericsson or E.I.C. magneto, Amac carburetter, Leatheries *De Luxe* saddle, Dunlop 26in. × 2in. studded tyres, Dunlop belt, and aluminium footboards. The engine is a 2¾ h.p. two-stroke having roller bearings, internal flywheels in addition to the usual external flywheel, and an adjustable pulley. The magneto is driven direct by the engine-shaft. Raised or semi-T.T. handle-bars are fitted as desired. The price has been fixed at thirty-nine guineas, at which figure undoubtedly it is a very attractive proposition.

To Foil the Motor Cycle Thief.

A New Wheel Lock capable of being fitted to any type of Motor Cycle.

SINCE the theft of motor cycles has become almost an epidemic, one is constrained to wonder why there have not appeared on the market locks to circumvent the thief. True, many readers have thought out ingenious devices to prevent a motor cycle from being stolen, but few firms have introduced a lock capable of being fitted to any existing machine without structural alterations. For this reason no doubt many readers who have lived in fear of losing their machines will be pleased to learn that a company has been formed—known as the Coventry Motor Lock Co., Ltd., with temporary offices in Queen's Road, Kenilworth—to manufacture motor locks of various types, among which two motor cycle models are included.



The Shakeshaft motor cycle lock, marketed by the Coventry Motor Lock Co.

5,000 Different Keys.

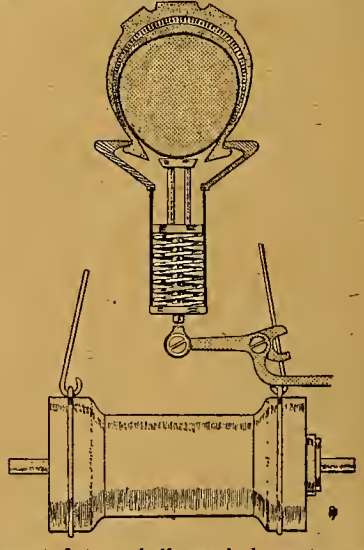
Briefly, the device consists of a Yale box lock, which is made to suit no fewer than 5,000 different keys, and a swivelling cross bar for inserting between the spokes of the wheel. The lock is fixed to the left side stay by means of four screws which are riveted into the recesses provided in the attaching member. When this is done it is utterly impossible to remove the lock without cutting it completely across on both sides, which, of course, is more than even the most enterprising thief could do in the time usually at his disposal.

Quickly Operated.

On the right side stay a swivel bar carrier is fixed in a similar manner, the bar of which is of hardened steel, having no shoulders or other abutments by which the lock could be forced. When not in use this bar falls into a position parallel to the stay, to which it is secured by a steel clip. The largest model of this lock, which is suitable for full and medium-powered machines, weighs about 3 lb., and is being marketed at £2 2s., but smaller and lighter types will shortly be available for lightweights and pedal cycles.

A PUNCTURE WARNING DEVICE.

THE invention which we illustrate is described in our French contemporary, *L'Auto*. It consists of a rod provided with a spring which abuts on the inner tube, so arranged that when the tyre is deflated it allows a short rod, connected to a bell crank lever to come into contact with a metallic disc, enabling the driver to stop the machine the very moment the tyre is deflated. It can be so adjusted that it comes into operation before deflation is complete.



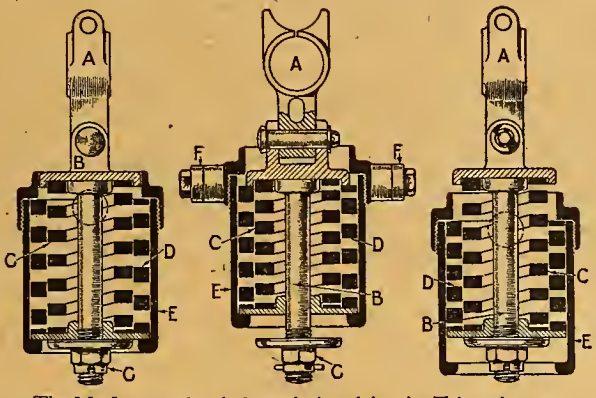
The MacLean Fork Spring System.

A Self-contained Self-damping Spring applicable to Many Standard Makes of Motor Cycles.

IN these days of rough roads, the question of springing is a most important one. Not only is good springing essential for the rider's comfort, but it saves the wear and breakage of parts, and prevents the shaking loose of nuts. Up to the present time, the MacLean fork spring has been specially adapted to Triumph and James spring forks, while an adaptation has also been manufactured for scooters.

In the form fitted to the Triumph motor bicycle, two helical springs are employed—a small diameter strong spring placed inside one of larger diameter. Both are totally enclosed, and the small spring butts up against a disc at the end of the head clip casting at one end, while at the same end the large spring butts up against the screwed cap on the spring casing. At the other end both springs rest against a large disc. Behind this disc is a washer, and behind the washer a nut, by means of which the tension of the inner spring may be adjusted so as to suit the weight the motor cycle has to carry.

In the MacLean system, which is sold by Tilston Engines, Ltd., Albion House, New Oxford Street, London, the springs are held in such a manner that they are *always* in compression, which cannot be the case when a spring is anchored at each end. The coils, moreover, are all of equal size, so that each one can do its full duty. In the case of springs with tapered ends the centre coils do the greater part of the work. In the MacLean system, however, the strong spring carries the principal load, while the large diameter spring comes into operation only when a serious pot-hole is encountered; consequently the spring system should cause the fork to be extremely sweet in action, since the large spring should act as a useful damper, effectively preventing rebound and dither, keeping the front wheel on the road, and thus saving excessive tyre wear and breakages of fork springs or mudguard stays. In the event of a broken spring, little harm can ensue, as it is unlikely that both springs will break at once, while it would not be difficult to render the fork rigid.



The MacLean spring fork, as designed for the Triumph motor cycle.

A. Head clip
B. Eye bolt hinged to head clip
C. Inner main spring
D. Light auxiliary and recoil spring.
E. Adjustable cylindrical casing
F. Fork ends (Triumph)
G. Nut for adjusting spring to suit load

Referring to the illustrations, fig. 1 shows the arrangement in the normal position. The inner spring is already slightly compressed by the weight of the machine, while the outer spring is at rest, and does not come into operation until the inner spring has moved ¼in., which is practically equal to ½in. on the front wheel.

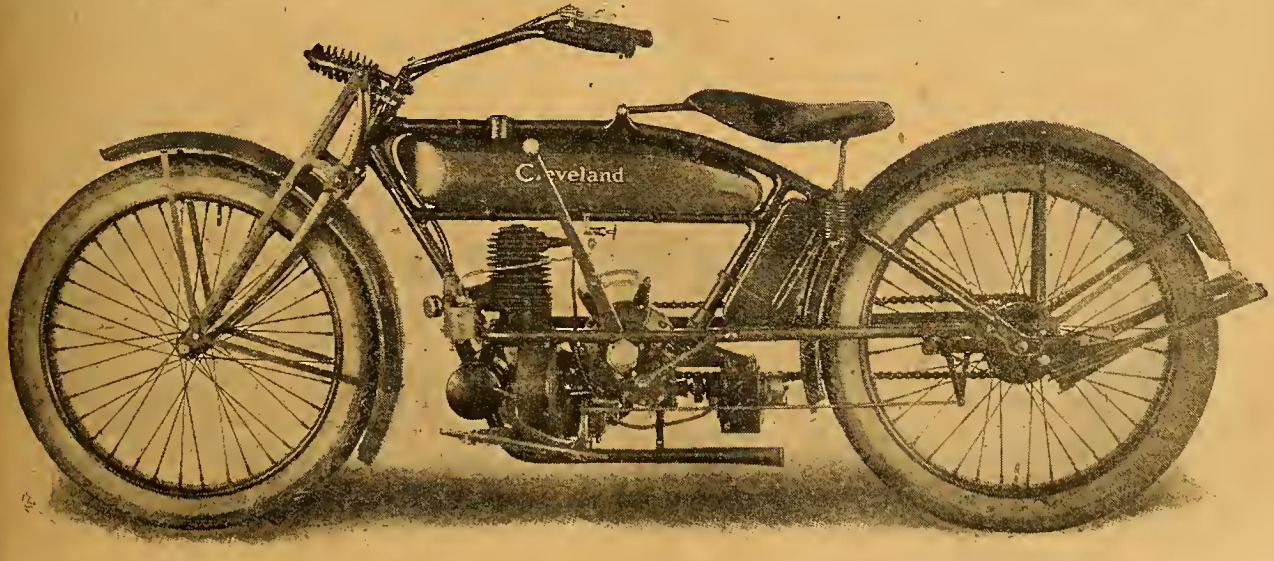
Fig. 2 shows what happens when a severe bump is struck. The inner spring is now compressed ½in. plus the original adjustment, while the outer spring has been compressed slightly.

Fig. 3 demonstrates what happens during the rebound. The inner spring returns to its normal condition, and the soft outer spring damps the recoil.

The device described can be fitted to Triumph motor bicycles in a few minutes.

The 1920 Cleveland Two-stroke.

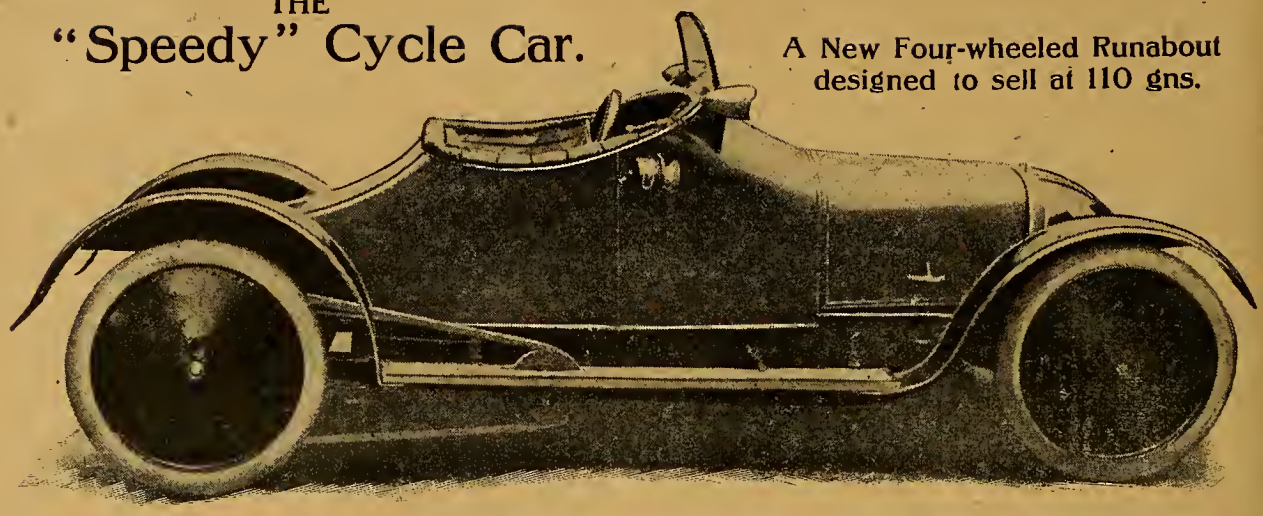
THE Cleveland two-stroke is America's leading lightweight, and, although it is not marketed in this country, our readers are more or less familiar with the appearance of the machine. For 1920 the general outlines have been altered—and improved—a so-called streamline tank being fitted, which is of two-piece steel construction. The frame has been strengthened by the addition of an extra horizontal tube, and the top tube is curved, giving a saddle position 28in. from the ground. Steel pressings are used for the front fork, which is of the Triumph type as in previous models. The power plant remains unaltered, and consists of a two-stroke engine placed across the frame, driving a two-speed gear box by shaft and worm; the magneto is shaft driven. The final transmission is by chain over sprockets of equal size.



The 1920 Cleveland, one of the few two-strokes made in America, in which the gear box is integral with the engine.

THE "Speedy" Cycle Car.

A New Four-wheeled Runabout designed to sell at 110 gns.



The "Speedy" cycle car, a newcomer in the runabout world, fitted with an 8 h.p. Chater-Lea air-cooled engine, two speeds, chain and belt transmission.

AS was to be expected when the prices of small cars rose into figures exceeding £300, a number of designers have realised that there is an opening for light four-wheelers on runabout lines. One of the latest machines in this class of vehicle will shortly appear on the market from the factory of Messrs. Pullinger and Co., Latona Works, Peckham, and will be known as the Speedy.

The weight of this new proposition is said to be 5 cwt., which, for a vehicle of this type and specification, is exceedingly light. The engine is an 8 h.p. air-cooled Chater-Lea, with its crankshaft across the frame. The primary drive to the gear box is by chain from a leather-to-metal cone clutch, which is located on the near side of the engine and connected directly to the engine-shaft. A decompressor is fitted to each cylinder with the object of dispensing entirely with the exhaust valve lifting mechanism. A single lever carburetter is supplied, and is operated, either by means of the Bowden lever in the centre of the steering wheel, or the accelerator pedal.

A Simple Specification.

Direct steering gear is employed, the steering column being clamped to a sleeve which is capable of revolving on the front cross member, thereby providing an adjustable rake. The gear box, containing two speeds forward and a reverse, is rigidly held to one of the tubular cross members. The gear change lever, operating in a gate, is situated in the centre of the floor, adjacent to which is a brake lever, sliding in a quadrant, operating a contracting band around a drum mounted on the countershaft. The foot brake, however, actuates two brake blocks on the belt rims of the rear wheels.

The countershaft, driven by chain from the gear box, consists of two separate shafts, one sliding within the other. The outer one, to which is attached the *inner* flange of the belt pulleys, rotates on two plain bearings bolted to the longitudinal chassis members. The inner one, however, which carries the *outer* flanges of the pulleys, is allowed to slide within the outer shaft by means of the longitudinal slot in which a key on the outer sleeve is fitted. The differential action of the countershaft is automatically actuated by the road wheels in turning a corner, expanding and contracting the pulleys.

Extensive premises at Clapham have recently been purchased entirely for the production of this cycle car, which will be manufactured in large numbers.

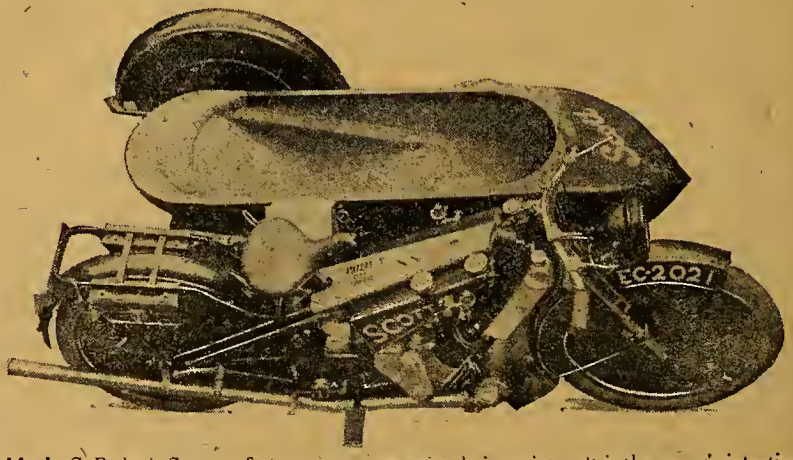
A Sporting Sidecar Outfit.

A Converted Scott with a Remodelled Engine.

KENDAL is a favourite rendezvous for North-country motor cyclists, many of whom are well acquainted with Mr. L. S. Parker, the enterprising agent at that town. Recently, when returning from a North-country trial, we paid Mr. Parker a visit, and were very much interested in his converted Scott machine, which was described fully in this paper some months ago.

A Rotary Distribution Valve.

As our illustration shows, this machine, with its low sporting sidecar, presents a most attractive and racy appearance, and could not but make a strong appeal to the younger generation of riders. It was therefore with considerable interest that we learned of there being a possibility of Mr. Parker's dreams materialising in the way of placing a similar mount of his own design and covered by his own patents on the market. Mr. Parker has



Mr. L. S. Parker's Scott outfit from an unconventional viewpoint. It is the owner's intention to market a two-cylinder rotary valve two-stroke motor cycle.

absolute faith in the two-cylinder rotary valve two-stroke, and certainly the results he has obtained from this mount, the all-round efficiency of which, both as regards running and fuel consumption, is exceedingly satisfactory, warrant his belief.

The rotary valve employed in this remodelled engine has stood prolonged tests without undue wear, its success being due perhaps to the lubricating system, which consists of drip feed into the induction pipe—attaining the same end as petroil without its objectionable features.

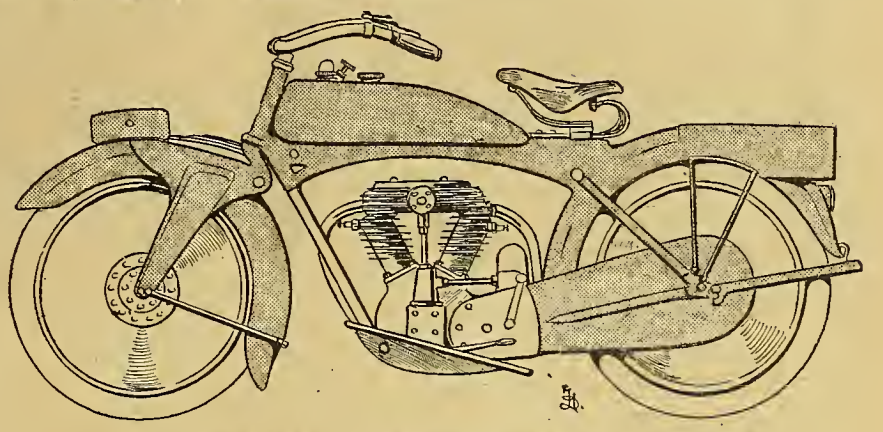
MOTOR CYCLES AT THE PARIS SHOW.

Notable Improvements in Design.

Up-to-date Machines exhibiting Great Originality introduced by New Firms.

Rear Springing Systems Common.

FOR some years past the motor cycling community of this country has shown but a lukewarm interest in the French motor cycle productions. Though our *confrères* across the Channel have often proved that they can produce excellent racing engines, they have, generally speaking, failed to produce complete motor cycles of outstanding merit. This promises to be altered now, and to those who have an opportunity of visiting the exhibition in the Grand Palais, which closes on the 19th inst., the enormous improvement in French motor cycle design must come as a considerable, though welcome, surprise. It is true that there are not a great many exhibitors, and that some of the most interesting machines are not attractive to the British eye. Yet such is the striking originality of the designs that our manufacturers would do well closely to observe the trend of French thought. Several of the 1920 models show a combination of the best points of British and American machines, with an admixture of truly French ingenuity, which marks a milestone in the history of Continental motor cycle manufacture. After half-hearted measures, the French industry is undoubtedly at last tackling seriously the problem of catering for the enormous potential market, and although British machines are still the most common on the streets of Paris, a change is more than likely to be effected in the immediate future.



The Louis Clément, one of the most advanced designs shown at the Paris Salon.

Clean Design.

Three-wheelers are attracting some attention, and four designs of pedal cycle attachments and one scooter are displayed. In the main, however, real lightweights seem to be disappearing, and giving place to medium or heavyweight machines, capable of hauling a sidecar with ease and comfort.

Perhaps the most noticeable feature to students of French motor cycle design is the absence of loose control rods and badly-fitted Bowden cables. The change is so complete that quite a large proportion of manufacturers have adopted twist-grip control. A further noticeable feature is that specially neat fixings for tool bags, speedometers, and other extraneous fittings are the rule rather than the exception. A stand-to-stand inspection reveals so many points of minor interest that only the more salient features are dealt with in the following review of the motor cycle exhibits in the Salon, the first important after-the-war show, and, incidentally, the first European exhibition for six years.

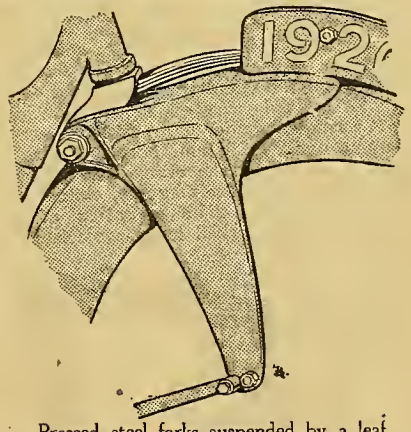
Louis Clement.

This machine, which is one of the most original motor cycles in the show, must not be confused with the well-known products of Clément Frères, who have unfortunately decided to retire from the motor cycle trade.

The whole of the Louis Clément motor cycle is extremely novel, and shows a careful study of the more advanced section of British thought combined with excellent design and ingenious construction.

A V type twin-cylinder engine having a bore and stroke of 62×90 mm. respectively is formed as a unit with a three-speed gear box of the sliding type. The clutch and front chain are entirely enclosed in the crank case casting, and the gear-driven magneto is mounted on the top of the gear box.

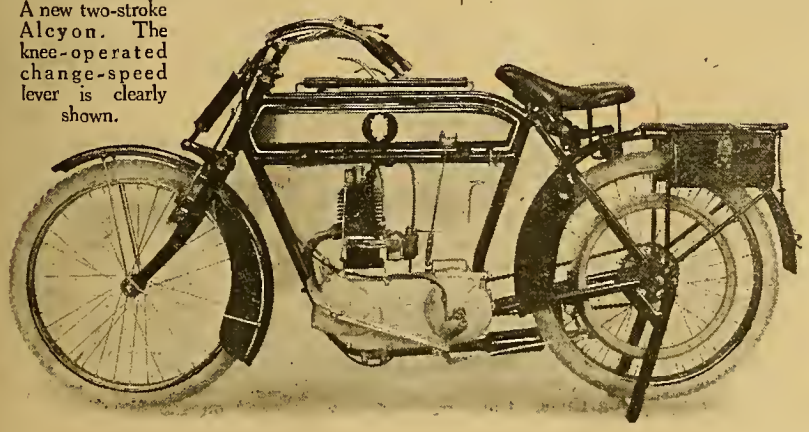
At first sight it would appear that the cylinders are joined by a common combustion space, but in reality the well-ribbed casting which connects the detachable cylinder heads forms a cover for the enclosed overhead valve gear and camshaft. The camshaft lies across the frame and vertically above the crankshaft. It is driven from the crankshaft by a vertical shaft and suitable bevels, the overhead valves being operated therefrom by rockers.



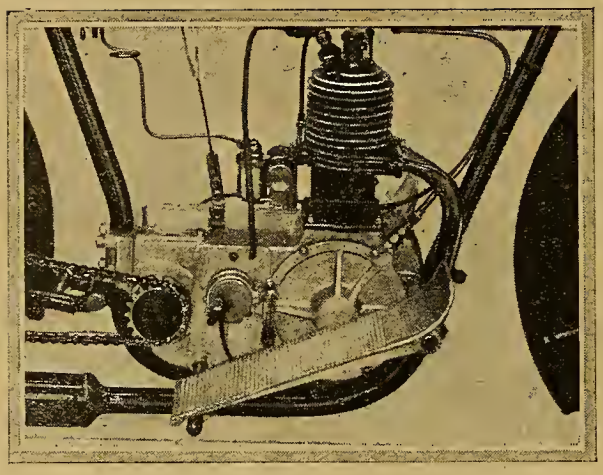
Pressed steel forks suspended by a leaf spring are part of the equipment of the Louis Clément.

The final drive from gear box to rear wheel is by means of a chain fitted with a shock absorber, and all wheels, which are of the disc type, are interchangeable, and fitted with internal expanding brakes. At present the engine is lubricated by a sight-feed drip, but it is intended to adopt a mechanical oil pump.

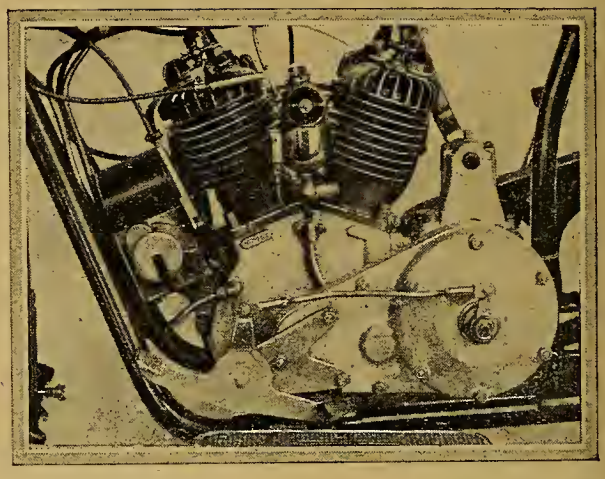
The frame is constructed partly of tube and partly of steel pressings. Pressed steel forks, whose motion is controlled by



A new two-stroke Alcyon. The knee-operated change-speed lever is clearly shown.



The combined engine and gear box of the Alcyon two-stroke. Note the magneto contact-breaker.



A view of the power unit of the new 4 h.p. Indian "Scout" model.

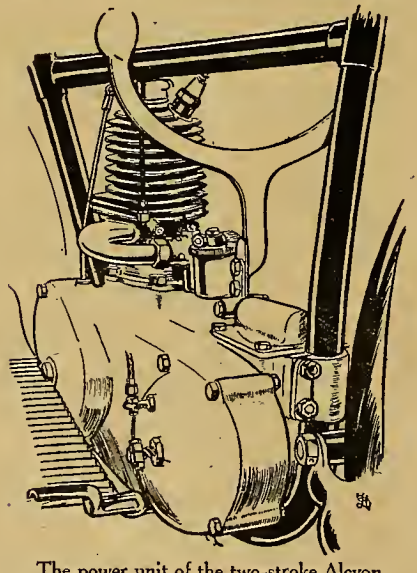
a leaf spring, are fitted to the steering head, which is solid with the main frame pressing. On this pressing, which extends rearwards to form the rear mudguard, saddle stay, and tool box, rests the tank and the saddle, the latter being mounted on three leaf springs. Aluminium footboards are extended to form a very complete undershield and a speedometer is neatly let into the tank.

Alcyon.

The Alcyon is one of the best known makes of French motor cycle, and the firm staged a small single and a twin of more or less orthodox design. But the feature of the stand was undoubtedly the Ballot-engined two-stroke. This machine has a single-cylinder three-port two-stroke engine of 75 × 80 mm. bore and stroke. An extension of the crank case encloses the silent chain, the magneto, clutch, and two-speed gear. The operation of the gears is by a forked lever projecting on either side of the tank, so that the rider can effect a change of ratio by the pressure of his knees. A hand control is provided for the clutch, and the magneto, which lies between the engine and gear box, is driven by the primary transmission chain, and, as mentioned above, it is entirely enclosed, except for the contact breaker, which projects through one side of the crank and gear box housing.

A feature of this very ingenious unit is that the right side footboard acts as a kick starter. This footplate is hinged at the front, and when depressed it causes the engine to rotate, and simultaneously brings the decompressor into action at the necessary period.

Final transmission is by roller chain, and, a loop frame being adopted, the machine has a very neat appearance. In addition to these models, a twin-cylinder four-stroke combined with two-speed gear box was to have been shown, but had not arrived at the time of our visit.



The power unit of the two-stroke Alcyon, showing the unusual type of change speed lever.

Gratieux.

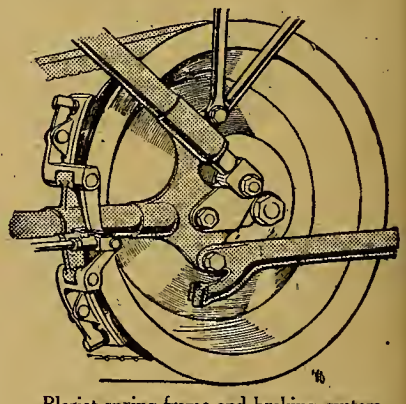
The 2¼ h.p. Gratieux two-stroke was described in our issue of the 9th inst. Three of these little machines are displayed.

Bleriot.

Quite one of the most important features of the Show is the fact that the well-known aircraft firm of L. Blériot have decided to enter the motor cycle market. Their production is well worthy of its originators, and though some may cavil at the type of engine selected, and the somewhat "stumpy" appearance of the complete motor cycle, there can be no two opinions as to the ingenuity of the design, or the excellence of the construction. The engine is a vertical side by side twin, having a bore of 60 mm. and stroke of 88 mm. (499 c.c.), having both connecting rods attached to a common crank pin.

The two cylinders of the engine are mounted close together, the exhaust valve being set in front and the inlet behind, both being of exceptional size. The valve springs are neatly enclosed by split covers, held together by spring rings. Combined with the motor is a two-speed gear box, having both trains of gears in constant mesh, a selective clutch mechanism being employed to determine the ratio. The change is normally carried out by means of a lever, but when the high gear clutch is in use a pedal provides an alternative method of declutching.

Lubrication is to a large degree automatic, a considerable quantity of oil being carried in the engine base. This oil is splashed to all working parts, including the clutch box, draining back to the base, and replenished when necessary through a sight feed drip. The final drive is by belt running over a very large front pulley.



Bleriot spring frame and braking system. Disc wheels form part of the standard equipment.

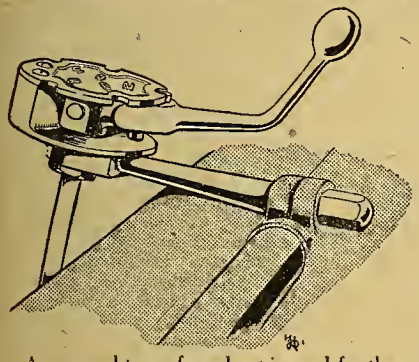
The frame is a sound piece of work, suspended in front by coil springs through a trailing link action, and the machine can be supplied with or without a spring frame. This springing is so neatly arranged as to be almost imperceptible, all springs being enclosed in the rear down tubes, and the necessary link action occupies but a small space. Both disc wheels are shod with 650 × 65 mm. tyres, and the rear mudguard is extended over the top of the belt rim.

Duplex tanks conceal the tank rails, and are joined on the lower sides by a combined tap and priming device.

As is the rule on French motor cycles, both brakes act on the belt rim, one above and the other below the chain stay, and the actuation is controlled by twin pedals placed side by side, so that either one or both brakes can be applied as desired. A refinement which will be appreciated by many is that the angle of the handlebars is easily adjustable. Twist-grip controls are installed, and a special compartment for tools is arranged in the tank.

Motosacoche.

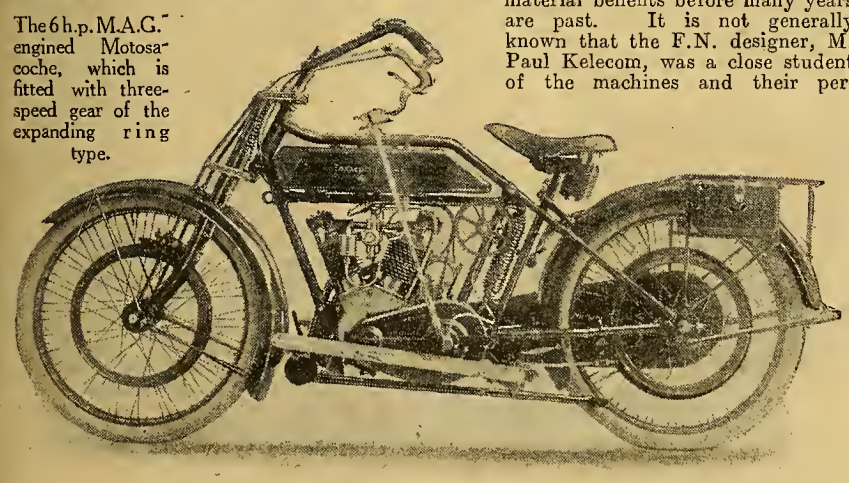
Our readers need no introduction to the Motosacoche either as regards its leading features or the excellence of its workmanship. There are, however, some interesting details incorporated in the new models, the chief of which lies in the new three-speed gear. This gear is similar to the Enfield two-speed in general layout; there are, however, three primary chain drives and three expanding clutches, the adjustment for each of which is independent and easily accessible. Another important feature is the springing system, which is arranged somewhat on the lines of the Bat and insulates the rider only, the saddle tube and footrests being supported by a large tension spring placed behind the down tube. All wheels are



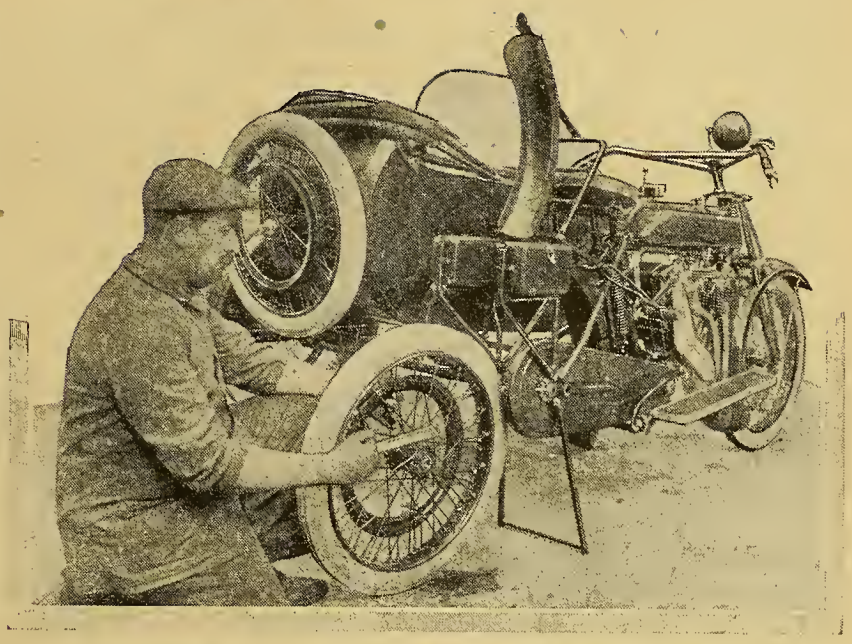
An unusual type of quadrant is used for the three-speed gear of the new Motosacoche.

now detachable and interchangeable, and fitted with special dummy belt rims in which both front and rear wheel brakes act. 4 h.p. and 8 h.p. models are shown, the former being a twin of 64×77 mm., and the latter a twin of 82×95 mm. All models are, of course, fitted with the well-known M.A.G. engine, which has undergone practically no alteration.

The khaki finish, combined with first-class fittings and entirely armoured tool-bags, gives the machine a very pleasing and clean appearance.



The 6 h.p. M.A.G. engined Motosacoche, which is fitted with three-speed gear of the expanding ring type.



The rear wheel of the 8 h.p. Motosacoche is quickly detachable. Note the neat tool-boxes.

F.N.

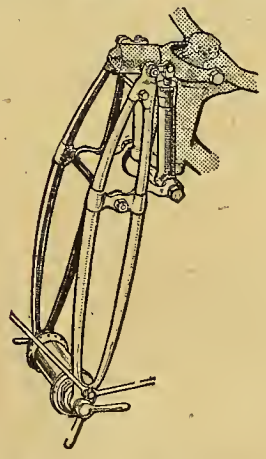
Everyone interested in the motor cycle industry must be glad to see an exhibit by the Fabrique Nationale, whose Liège factory is now emerging successfully from a most trying war-time experience. Both the 7 h.p. four-cylinder and 2½ h.p. single-cylinder models were on view at the Salon—and we have it on excellent authority that a revised edition of the four-cylinder machine will make its appearance before long. This firm has always been associated with the shaft and bevel transmission, in which respect it has suffered the usual lot of pioneers, but will undoubtedly reap material benefits before many years are past. It is not generally known that the F.N. designer, M. Paul Kelecom, was a close student of the machines and their performances in the A.C.U. Six Days Trials at Llandrindod, and the result is bound to be reflected in future F.N. designs.

Yvel.

Single-cylinder two-strokes, built almost entirely of British parts, form the attraction of this stand. A Villiers engine and Albion gear box are installed in an orthodox frame.

G.L.

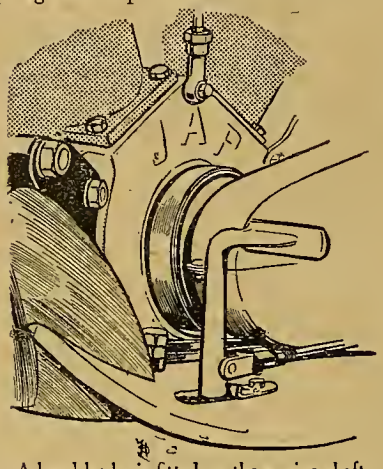
A most attractive exhibit was staged by the G.L. Both motor cycles and sidecars are beautifully finished. The machine was described fully in our issue



The G.L. front forks, which have a double movement.

for August 21st, and put up a good performance in the recent Six Days Trials in Wales. It will be remembered that the salient features are 4-5 h.p. twin J.A.P. or M.A.G. engines, Sturmey-

Motor Cycles at the Paris Show.—
Archer gear, all-chain drive, engine-shaft brake, and well designed spring fork and spring saddle pillar.



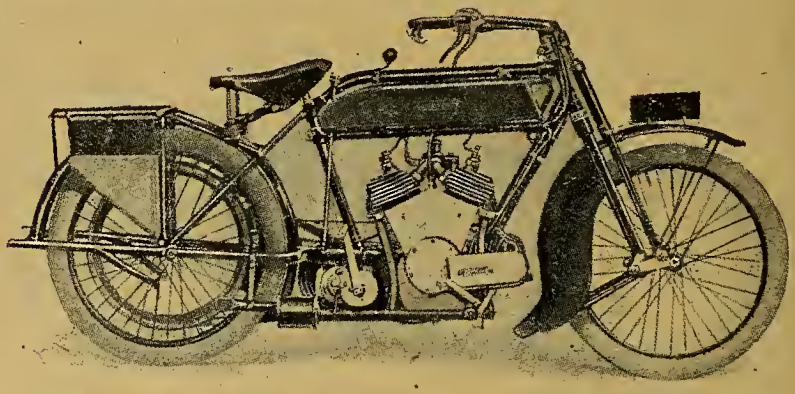
A band brake is fitted on the engine-shaft of G.L. machines.

Louis Janoir.

A large horizontally-opposed twin (85 × 85 mm.) forms the power plant of this very unorthodox vehicle. A disc clutch transmits the power to a three-speed gear box bolted to the frame just below the saddle (or front saddle, since the machine is designed for tandem use if desired). Final transmission is by roller chain, a sprocket for the speedometer drive being held in engagement with the driving side. Two internal expanding brakes are fitted one on either side of the rear wheel, and the wheels are quickly detachable and fitted with 750 × 85 mm. tyres. A very stoutly constructed tubular frame is suspended in front by powerful spring forks and at the rear by cantilever springs. Large detachable boxes for luggage are fitted on either side of the rear wheel, and very complete leg shields protect the rider from mud. Both crank and gear shafts are mounted on ball bearings, and the lubrication is effected under pressure by a gear pump.

Peugeot.

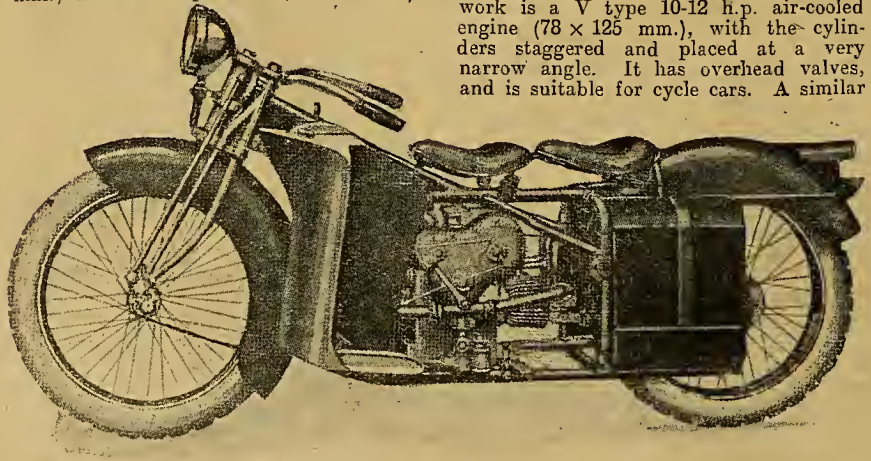
Two specimens of Peugeot motor cycles are shown, viz., a 3½ h.p. twin (56 × 70 mm.) and a 6 h.p. twin (70×96 mm.). Both machines are similar in layout, being fitted with primary chain drive, three-speed countershaft gear box, and final belt transmission. The valves are placed side by side and protected by a metal shield. Sidecar lugs are built integral with the frame of the 6 h.p. model, and the frame is somewhat unusual in that, though it is constructed on standard lines with a dropped top tube, the front is considerably higher than the rear. Both brakes act on the belt rim, and 650×65 mm. tyres are fitted. Armoured tool bags, adjustable foot rests, and a spring fork having single tubes and an enclosed spring are items of interest.



The 6 h.p. Peugeot, an exhibit conforming in general appearance to British design. A three-speed gear is fitted, and chain-cum-belt transmission.

Anzani Engines.

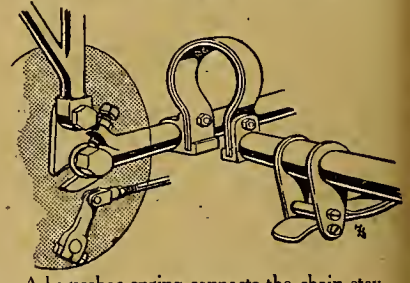
In addition to complete motor cycles several engine makers exhibit a goodly display of engines. No greater variety can be found than that on the stand of A. Anzani. They are beautifully finished, but in these and other engines we noticed an absence of adjustable tappets. The smallest Anzani engine shown is the 2-3 h.p. 75 × 80 mm., a single-cylinder, with a gear-driven magneto set at an angle. Another single-cylinder is the 3-4 h.p., 85 × 87 mm., fitted with a mechanical oil pump and crank case sump. A twin-cylinder of the same dimensions is made, and has the magneto placed in front, as on the Morgan-Jap. A particularly interesting example of Signor Anzani's work is a V type 10-12 h.p. air-cooled engine (78 × 125 mm.), with the cylinders staggered and placed at a very narrow angle. It has overhead valves, and is suitable for cycle cars. A similar engine of 12-16 h.p. (105 × 120 mm.) is also shown. The exhibit also contains several water-cooled models, both single and twin-cylinder. One of the most attractive engines on the stand is the side by side twin, the cylinders of which are cast in a pair, with an air space between. The dimensions are 60 × 90 mm. The magneto is placed at the rear, and the two-speed sliding gear is in the crank case. This is one of the few Anzani engines provided with adjustable tappets. A noticeable feature of most French motor cycle engines is the small diameter of the valve springs.



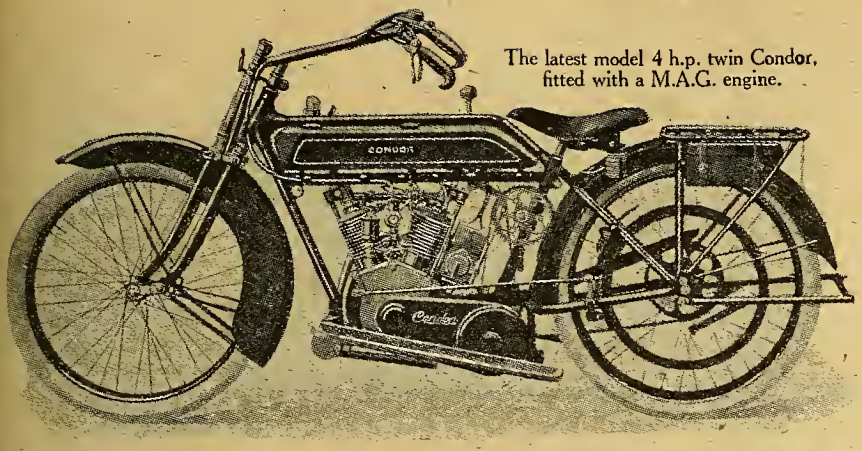
The 8 h.p. Janoir flat twin, designed for tandem use. Note the ample protection afforded the rider, and the large detachable luggage boxes.

A.B.C.

As already announced in *The Motor Cycle*, the A.B.C. is being manufactured in France by the Gnôme and Le Rhône Cie. The differences between the French and English machines are in detail only. Briefly, these differences lie in the fitting of a front stand, a new kick starter, stiffer springing, a Zenith carburetter, and a system of oiling in which the flow of oil from the tank to the pump is controlled. The novelty on this stand consisted of the new French sidecar constructed specially for the machine. It has a chassis composed of channel steel side members and tubular cross-members, rigidly attached to the frame of the motor cycle. The axle, however, is suspended on long leaf springs, a radius rod being fitted on the outer side. In addition, the axle is attached to the chain stay by means of a stiff leaf spring in the shape of a horse shoe, which is designed to give just sufficient flexibility to save the frame from undue strain. A comfortable sporting body is fitted to this smart outfit.



A horseshoe spring connects the chain-stay to the axle of French A.B.C. sidecar.



The latest model 4 h.p. twin Condor, fitted with a M.A.G. engine.

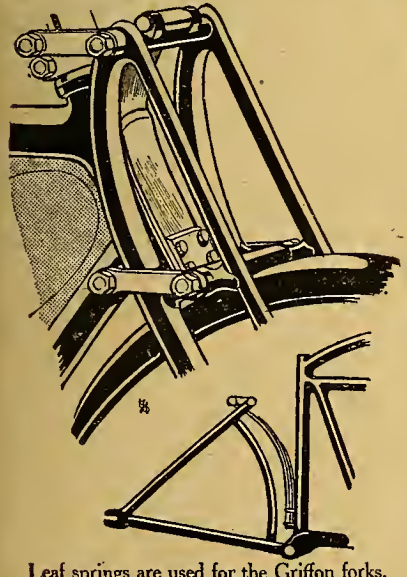
Condor.

Both single and twin-cylinder models are shown fitted with M.A.G. engines. For the purposes of description, the most fully equipped motor cycle will be used.

A primary chain drive with engine shaft shock absorber transmits power to an external band clutch, and a constant mesh two-speed gear, the control of which ensures clutch withdrawal when a change of ratio is made. The final drive is by belt, and both brakes act on the belt rim. Handle engine starting is employed, and the most striking feature of the frame is the use of double tubes wherever possible. A spring fork of the single or non-girder type insulates the front portion of the machine, and a combined spring saddle pillar and footboards may be obtained as an extra. It is interesting to note that the final drive leaves the gear box on the right hand side, and that the rear mudguard and carrier are quickly detachable from the back stays.

Griffon.

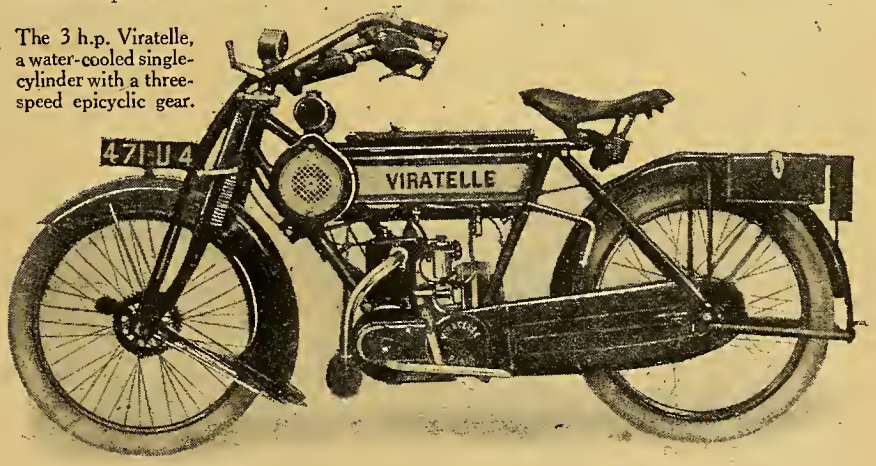
A 3 h.p. twin two-speed, with chain and belt drive, a 3½ h.p. single (ZL engine), single geared, and a 6 h.p. twin (Anzani engine), with Sturmey-Archer gear, comprise the models displayed on the Griffon stand.



Leaf springs are used for the Griffon forks. Inset, a diagram of the rear springing.

The 6 h.p. machine is the most interesting, having a very neat spring frame and forks. The rear part of the frame is pivoted behind the gear box, and the shocks are taken by a long leaf spring anchored to the base of the saddle tube. The rear portion of the frame is stiffened by an auxiliary down tube, on the lines of the new Clyno. A fork similar to the Druid is employed, but its action is controlled by a leaf spring lying parallel to the head and curved over at the top.

Staggered side by side valves are a feature of the Anzani engine fitted to this machine, the motor being a commendable piece of work.



The 3 h.p. Viratelle, a water-cooled single-cylinder with a three-speed epicyclic gear.

Viratelle.

A solitary example of water-cooling for motor cycles was the 3 h.p. Viratelle, an interesting machine having a single-cylinder engine with enclosed side by side valves behind the cylinder. The engine forms a unit with a very simple and ingenious three-speed epicyclic gear. This gear is the outcome of years of road experience, and runs on ball bearings throughout. A circular radiator is arranged in front of the tank, and inside the two halves of which it is composed lies a fan driven from the engine by a long belt.

A similar machine having two side-by-side cylinders is also manufactured, and drawings of a simple leaf spring fork were displayed. Combined spring footrests and saddle pillar may be fitted if desired.

Motosolo.

A very neat little two-stroke is shown under the above name. The engine is of the three-port type, but, contrary to usual practice it has the inlet and exhaust located at the rear of the cylinder. A chain-cum-belt drive is employed, a two-speed gear box being fitted to the bottom bracket. The frame has a sloping top tube, and Druid forks, with Terry links, are used.

Bianchi.

The new Bianchi described in our last issue was shown for the first time.

Moto Reve.

No very startling innovations were to be seen on this stand, but it was a pleasure once more to see a continental motor cycle which at one time obtained considerable popularity in this country. A small twin-cylinder machine with overhead inlet valves and a single with both valves in the head were staged. We noticed also a neat little engine shaft clutch.

Cyclotracteur.

Cycle attachments appear to be attracting the attention of French designers. The Cyclotracteur is a neat little four-stroke engine (50 × 55 mm.) with automatic pressure lubrication. The motor is carried by special front forks, and drives by friction on to the front tyre. A clutch is obtained by moving the friction wheel away from the tyre in a lateral direction.

Motor Fly.

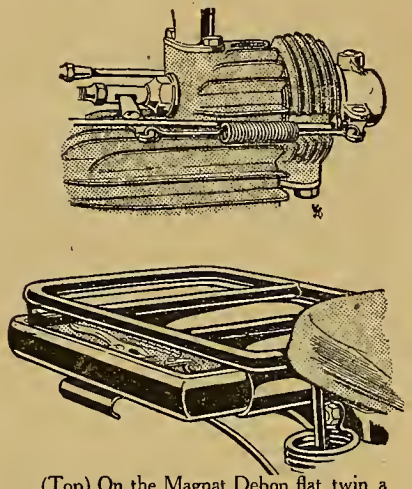
Another ingenious cycle attachment takes the form of a small inverted two-stroke, which drives by friction on to a fabric-faced drum on the rear wheel. This wheel is specially constructed, and consists of a disc dished back to one side of the wheel so as partially to enclose and protect the engine.

Rene Gillet.

The chief features of the production of this well-known firm are the very clean and well designed twin-cylinder engine and the two-speed epicyclic gear housed in a circular bottom bracket casting. Beyond these points the machine follows more or less conventional lines, and presents few novel features, but appears to be well constructed throughout. The gears are operated by pedal.

Magnat Debon.

A flat twin engine embodying several novel features is carried in a cradle attached to an equally unusual frame. In the sump of the engine is a simple two-speed gear, and a cone clutch is mounted externally, the final drive being by belt. Opposed valves are employed, the exhaust being overhead, and a single tension spring working through rockers



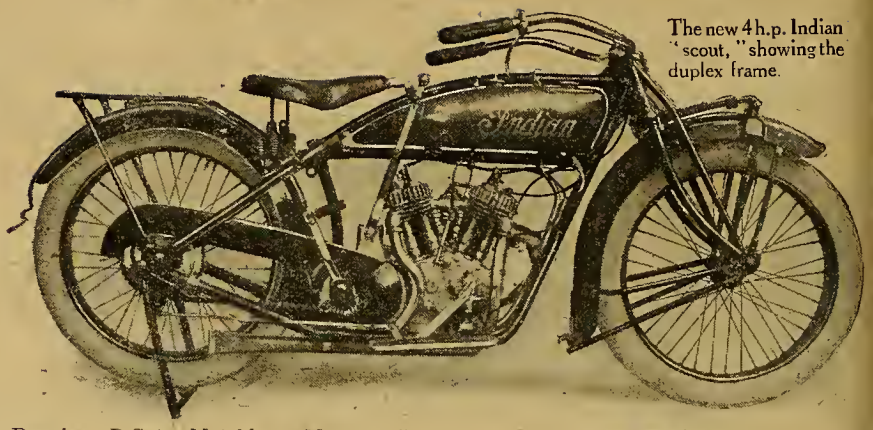
(Top) On the Magnat Debon flat twin a single tension spring returns both valves to their seatings. Below is shown the tool drawer under the carrier.

is utilised to return both inlet and exhaust valves. Mechanical lubrication is used.

In addition to spring forks both saddle-pillar and rear portion of the frame are sprung, and all springs are totally enclosed. An extremely neat metal tool drawer is fitted directly below the carrier and contains a very complete outfit of spares, as well as the necessary tools, each in its own special compartment.

British Machines.

There was a very representative display of British machines, which seem to have got a firm hold on the French market. Amongst the many were the Triumph, Douglas, B.S.A. Matchless, Morgan, P. and M., Triumph, Coventry Eagle, and Hobart, while the Velocette and New Imperial were amongst those which were unfortunately delayed by the railway strike.



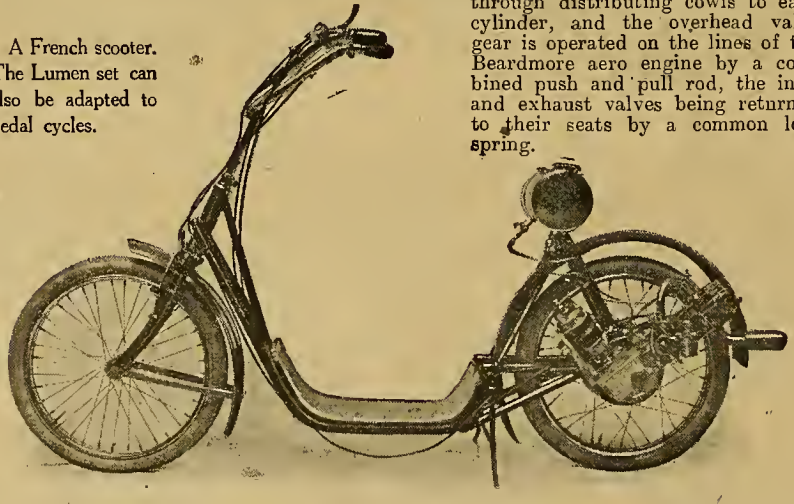
The new 4 h.p. Indian "scout," showing the duplex frame.

American Motor Cycles.

Two new comers from across the Atlantic were on view—the flat twin Harley-Davidson, which has already been described in these pages (August 14th), and the new 4 h.p. Indian, of which type we were able to illustrate the forerunner in our issue of September 11th. This is a very attractive medium weight machine with a smaller edition of the Powerplus engine built up into a unit with the gear box. The unit is carried in a duplex frame, the rear portion being unsprung and the front fork spring being modified.

Le Triauto Godet.

This is an interesting experiment in three-wheelers of the type which employs a twin rear wheel. A four-cylinder air-cooled engine (62 × 90 mm.) drives a two-speed bevel wheel gear box by shaft. The gear box is located at the rear of the channel steel frame, the final drive being by chain. The front suspension is by means of a long transverse leaf spring with auxiliary coil springs at the ends. The most notable features of the engine are the cooling and the valve actuation. A fan driven from the engine forces air through distributing cowls to each cylinder, and the overhead valve gear is operated on the lines of the Beardmore aero engine by a combined push and pull rod, the inlet and exhaust valves being returned to their seats by a common leaf spring.



A French scooter. The Lumen set can also be adapted to pedal cycles.

Train Engines.

One or two attractive motor cycle engines are shown by the Etablissements E. Train. They are chiefly conspicuous for their excellent finish. Two types of two-strokes are shown, the 2½ h.p., 65 × 74 mm. (245 c.c.), and the 3½ h.p., 76 × 76 mm. (345 c.c.). These engines can be had with either air or water-cooling. Three types of four-stroke engines are also shown by this firm—a single-cylinder 4 h.p., 80 × 90 mm. (498 c.c.), a 5-6 h.p. twin, 74 × 87 mm. (748 c.c.), and a 7-8 h.p., 80 × 99 mm. (995 c.c.). These models may also be obtained with water-cooling. The firm also produces a three-speed gear box, provided with enclosed kick starter, in which the change is effected by dog clutches. A mechanical oil pump of the piston type, driven by means of a worm and designed to work at $\frac{1}{16}$th of the engine speed, is also shown.

Moteurs Bi-temps.

Moteurs Bi-temps, Paris, specialise, as their name implies, in two-stroke engines, both air and water-cooled. These engines have ball bearings in the main bearings and big ends, and are of 2 h.p.

Lumen Scooters.

Scooters were represented only by the Lumen, a neat little power unit which is made in a form applicable to attachment to pedal cycles.

A small overhead valve motor of 55 × 60 mm. is attached to the rear forks in such a manner that the crankshaft passes through the hub, the flywheel being on the opposite side to the engine. The drive is through an epicyclic gear.

A circular magneto is used for ignition purposes, and in the case of the cycle attachment, both oil and petrol tanks form part of the rear mudguard.

Motor Cycle Accessories.

Very few accessories are to be seen, and the few that are visible are of British manufacture. The nearest approach to a well made motor cycle head lamp was to be seen on the stand of Willvey-Bottin, a Belgian firm with a London branch in Long Acre. Of ingenious tools and labour-saving devices, we saw none, but it is interesting to note that there are one or two cheap dynamo systems which can be adapted to motor cycles.

A neat acetylene lamp, primarily intended for pedal cycles, but none the less

Motor Cycles at the Paris Show.—

useful for motor cycles for short journeys in towns or as a sidecar lamp, is the Magnetic, sold by H. Picard. On the *lucus a non lucendo* principle, it is called the "Magnetic" because its source of light is calcium carbide.

Cycleauto.

A three-wheeler with a single steering wheel in front is by no means a new proposition, but the lay-out of the Cycleauto is unusual in many respects. A heavy motor cycle type spring fork is employed for the front suspension, and long semi-elliptic springs attached to the tubular frame are responsible for absorbing the road shocks at the rear. The engine is a two-cylinder water-cooled two-stroke, having side-by-side vertical cylinders. Transmission is by chain to an epicyclic gear on the countershaft, and two long belts running over large front pulleys provide the final drive. Driver and passenger are accommodated side by side in a comfortable body, provided with hood and screen. Steering is direct through a wheel and link motion. A radiator is placed in front of the engine.

Barrellier.

A quaint little three-wheeler with a single small front wheel is displayed on this stand. The *tout ensemble* is reminiscent of an invalid chair (for which type of vehicle the manufacturers are famous). Both single and two-seaters are made, and both are engined by horizontally-opposed two-stroke air-cooled engines combined with two-speed gears and fully enclosed magnetos. The final drive is by shaft and worm gear to a neat live rear axle.

Diable.

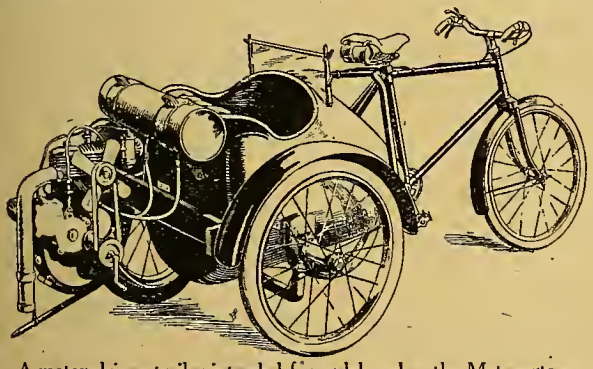
Possibly the neatest and most practical three-wheeler in the exhibition is the Diable, which is fitted with a remarkably clean looking 8 h.p. air-cooled V type engine. The engine forms a unit with a two-speed and reverse gear, a clutch being located behind the box. Shaft drive is employed throughout, the shaft being articulated at the point where the main pressed steel frame is joined to the spring rear portion. The final drive is by bevels, and the wheel is easily detachable. Suspension is by semi-elliptic springs in front and long cantilevers at the rear. One engine arm forms the steering gear bracket, and though the chassis was unfinished the vehicle displays a neatness and compactness which is more characteristic of French automobiles than of their lighter types of wheeled conveyances.

The Sulky.

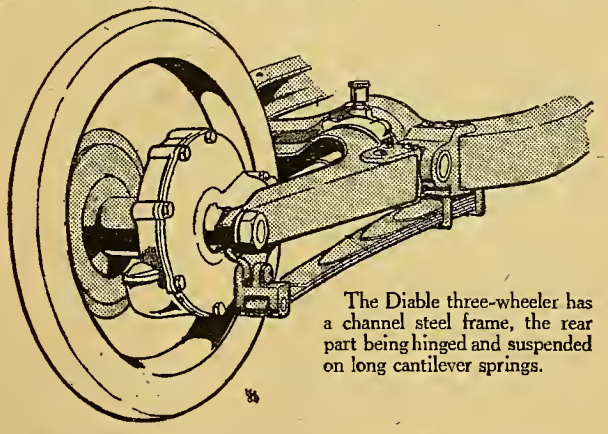
One of the many curiosities in cycle cars at the Show is the Sulky, made by the well-known aeroplane firm of Voisin. Its motive power is a two-cylinder engine fixed to the side of the frame, with the cylinders placed tandem fashion, and equipped with overhead valve gear. Thence the drive is by propeller-shaft to a small friction wheel, which engages with the inside of the near side wheel disc, the only wheel that is driven.

Motoporteur A.R.M.

One of the most curious vehicles in the motor cycle exhibit was a self-propelled trailer intended for attachment to pedal cycles. A small sidecar body contains the passenger, and the outfit is propelled by a single-cylinder Anzani engine through an almost incredibly short belt drive.



A motor-driven trailer intended for pedal cycles, the Motoporteur A.R.M.



The Diable three-wheeler has a channel steel frame, the rear part being hinged and suspended on long cantilever springs.

CLUB NEWS.

Future Events.

Manchester Hill-climb.

The hill-climb originally arranged by the Manchester M.C. for October 5th will be held on the 19th. Members will assemble at 2 p.m. at Sparrow Pit.

Petrol Imports.

During September 14,770,911 gallons of petrol were imported into this country, a quantity 1,500,000 gallons in excess of August figures. More than 20,000,000 gallons of what is described as fuel oil was also brought over last month. These are very satisfactory figures, and there is very little question that the temporary shortage of petrol at various garages throughout the country will soon be remedied.

The First Motor Cyclist Police.

The fact has already been made public that motor cycles are to be used in the Metropolitan Police Force. Now the Metropolitan area, which is protected by the Metropolitan Police, is a very large district consisting of numerous divisions. These divisions vary considerably in size, and the outlying ones occupy a far greater area than those in the heart of London, and it is to enable certain inspectors in these outlying areas to perform their duties that it has been decided to mount them on motor bicycles.

The idea at the present time is to provide ten sub-divisional inspectors with Douglas motor bicycles, as the authorities feel that this means of transport will be more rapid and more effective than that of inspectors mounted on horseback. It will be very interesting to see how the scheme develops, as we are given to understand that the authorities have further plans in view to develop the use of motor cycles.

IMPORTANT DATES.

Athens Motor Show	Oct. 13th to Nov. 14th.
Olympia Car Show	Nov. 7th to 15th.
Olympia Motor Cycle Show,	Nov. 24th to 29th.
Brussels Show	Dec. 8th to 13th.
Paris Aero Exhibition	Dec. 19th to Jan. 4th.
New York Show	Jan. 3rd to Jan. 10th.
Paris-Nice Trial	Feb. 13th to 16th.

The Institution of Automobile Engineers.

The inaugural meeting of the Institution of Automobile Engineers, which was postponed from October 1st owing to the strike, will now be held at the Royal Society of Arts, John Street, Adelphi, W.C.2, on Wednesday, October 22nd, at 8 p.m., when Mr. Thos. Clarkson will deliver his presidential address.

The meeting of the Midland Centre will be held on Thursday, October 23rd, in the hall of the Chamber of Commerce, New Street, Birmingham, at 7.30 p.m.

An inspector of the Metropolitan Police on one of the fleet of Douglas motor cycles which will be used by inspectors for work in outlying districts.

Special Features.

PARIS SHOW.
AN UNCONVENTIONAL BRITISH DESIGN.
POLAR INDUCTOR MAGNETO.

A New Four-cylinder American Machine.

An American contemporary reports that Mr. W. G. Henderson, the designer of the Henderson four-cylinder motor cycle, has left the Excelsior-Henderson Co., and is associated with a new company, which will introduce a new four-cylinder machine, which was mentioned in our American news letter in the issue for October 9th.

Lighting Regulations.

The necessary lamps which the motor cyclist should display in order to comply with the law (existing at the moment) are as follows: A solo machine must carry a head lamp and a rear light. If the latter illumines the rear number plate the front plate may be ignored. If the rear numbers are not easily legible the front plate must be illumined *on both sides*. A sidecar outfit, in addition, must carry a second lamp facing forwards to show the extreme width of the vehicle, and the rear light must be placed at the off side.

Six Days Motor Cycle Trial.

The publication of the Judges' Report of the Auto-Cycle Union's recent Six Days Reliability Trial is being urged on as rapidly as possible, but, owing to the difficulties encountered in securing attendance at meetings due to the railway strike, there has been some little delay in this work. The official report will deal with every aspect of the Trial, and will give to the public all information possible as to the reasons for the Judges' deductions of marks and award of medals. It should prove of great value and interest to motor cyclists and intending purchasers of machines.

Surplus Army Motor Cycles in U.S.A.

A total of 1,341 American surplus army motor cycles have been transferred by the War Department to other departments. Thirty-one Cleveland lightweights and 1,057 Indians have been turned over to the Post Office authorities, 140 Indians to the Public Health Service, fifty-seven Indians and forty-seven Harley-Davidsons to the Navy and Marine Corps, and several smaller lots to other departments. Over 34,000 machines were delivered to the War Department, including 15,000 Harley-Davidsons and 18,000 Indians. 1,476 Cleveland lightweights were delivered. Altogether the American Army used over 30,000 sidecars.

Police Trap.

We are informed that a police trap is working between Kentish Town Station and Camden Town Station (Hampstead Tube).

An American Six Days Trial.

The motor cycle world in the U.S.A. are enthusiastic about our Six Days Trials, both the English and Scottish, and an attempt will be made to hold a trial of a similar nature in that country next year.

Flying Kilometre Races in Belgium.

In flying kilometre races held by the Antwerp Motor Club, on the 6th inst., the solo motor cycle class was won by Vanheurck (Indian), and the sidecar class by Depret (Rudge). The Indian rider won the special cup offered for highest speed, and rode the kilometre with flying start at the rate of 65.8 m.p.h. Flying kilometre races were held on Sunday, and a good entry was secured. Among the British machines were Douglas, Clyno, Rudge, Triumph, B.S.A., Rex-Jap, and James. America was represented by Harley-Davidson, Indian, Reading Standard, and Excelsior.

Imports and Exports.

The imports of motor cycles for September did not vary greatly from the previous month. Twenty-two more complete motor cycles were sent over, but fewer parts and accessories.

IMPORTS, SEPTEMBER.

	1917.	1918.	1919.
No. of motor cycles	—	—	188
Value of motor cycles, including parts, tyres, accessories, etc.	£1,144	£2,421	£16,581

The export figures for September did not reach the level of those of August. Certainly there was only £1,500 difference, but it would have been more satisfactory to have found the export curve upwards instead of downwards.

EXPORTS, SEPTEMBER.

	1917.	1918.	1919.
No. of motor cycles	952	166	664
Value of motor cycles, including parts, tyres, accessories, etc.	£79,006	£27,415	£108,390

Spanish Championship.

A motor cycle race, over a distance of about 250 miles, was to have taken place on Sunday last, for the motor cycle and sidecar championship of Spain, the winner to receive a challenge cup presented by the King of Spain.

Benzole Prices.

The National Benzole Co. has issued the following authorised list of retail prices of National benzole: Two-gallon tins 2s. 9d. per gallon; fifty-gallon drums 2s. 8d. per gallon. The deposit for a steel barrel or drum is 70s. In Scotland 1d. per gallon extra may be charged.

Average Second-hand Prices.

The subjoined list of average second-hand prices is not nearly so complete as the last one published in the issue of October 2nd. Many well-known makes, which are usually well represented in the second-hand market, are noticeably absent at the moment—the strike, no doubt, inducing many to retain machines which would have otherwise changed hands. On the whole, prices show a decided upward tendency, especially so in the case of certain much-sought-after makes.

A.J.S., 1916 and later, 6 h.p., sidecar	£165
Ariel, 6-7 h.p., sidecar	£155
Bradbury, 4 h.p., single-speed, solo	£26
,, 4 h.p., 2-speed, and sidecar	£48
B.S.A., 4¼ h.p., 3-speed, sidecar	£111
Calthorpe-J.A.P., 2¾ h.p., 2-speed	£35
Clyno, 2-stroke, 2-speed	£40
,, 5-6 h.p., 3-speed, sidecar	£110
Douglas, 2¾ h.p., W.D.	£61
,, 4 h.p., 3-speed, sidecar	£112
Enfield, 1917, 3 h.p., twin, 2-speed	£64
,, 6 h.p., sidecar	£132
Harley-Davidson, 3-speed, sidecar	£159
Humber, 3½ h.p., 2-speed, sidecar	£54
Indian, 1914, 7-9 h.p., 2-speed, sidecar	£107
Matchless, M.A.G., sidecar	£147
New Imperial, 2¼ h.p., 2-speed	£47
P. & M., 1919, 3½ h.p., solo	£95
,, 1919, 3½ h.p., sidecar	£105
Rover, 1918-19, 3½ h.p., T.T.	£80
,, 1919, 5-6 h.p., 3-speed, and sidecar	£130
Rudge-Multi, 3½ h.p.	£89
Scott, solo	£64
,, and sidecar	£82
Sunbeam, 3½ h.p., and sidecar	£152
Triumph, 3½ h.p., single-speed	£32
,, 3½ h.p., 3-speed hub	£54
,, 4 h.p., 3-speed, countershaft, solo	£90
,, 4 h.p., 3-speed, countershaft, sidecar	£127
Zenith, 6 h.p., solo	£77
,, 6 h.p., countershaft, and sidecar	£91

Storage of Fuel.

The following regulations concerning the storage of petrol and benzole were issued in June. We repeat them for the benefit of readers whose knowledge on the subject is vague, and who may be anxious to keep a quantity of fuel in stock, in view of the recent disturbances.

Notwithstanding anything in No. 10 of the regulations dated 31st July, 1907, petroleum spirit may be kept for the purposes of light locomotives in iron or steel drums or barrels of a capacity not exceeding fifty gallons, provided the following conditions are observed:

(*a*) The storehouse must be situated at a distance of at least twenty feet from any other building or any highway or public footpath.

(*b*) Provision must be made by excavation or by the erection of retaining walls to prevent outflow of the spirit in the event of fire if such outflow would be likely to endanger life or cause damage to the property of others.

(*c*) Notice shall be given to the local authority, and the duly authorised officer of such authority shall be allowed to inspect the spirit in the same manner as is provided in No. 7 of the said regulations.

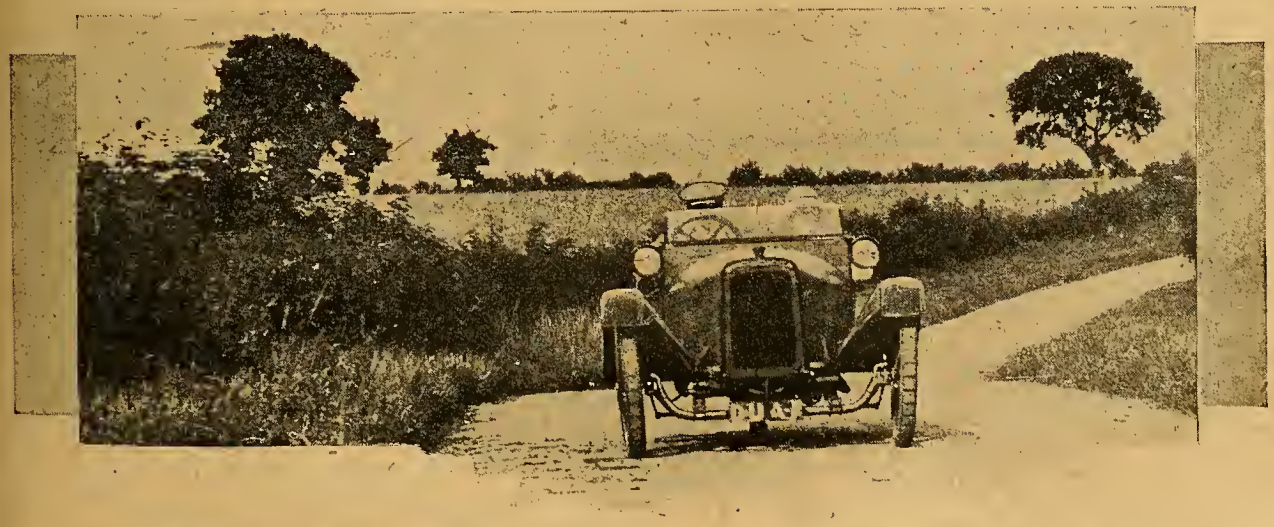
This regulation shall remain in force until 31st December, 1923, unless sooner revoked.

Standardisation of Chains.

The Association of British Driving Chain Manufacturers announce that they have now completed the standardisation of roller chains up to ⅜in. pitch. For the convenience of chain users, and to ensure complete interchangeability, they have also standardised chain wheel tooth forms. These new tooth forms, while not being identical with any of the existing forms, incorporate the essential features of each.

Particulars of the standards set up by the Association of British Driving Chain Manufacturers are to be published in pamphlet form, and will be obtainable from the secretary of the Association of British Driving Chain Manufacturers, Bassishaw House, Basinghall Street, London, E.C. The Association comprises the following well-known firms: Alfred Appleby, Ltd., Birmingham; Brampton Bros., Ltd., Birmingham; "The Coventry" Chain Co., Ltd., Coventry; Perry and Co., Ltd., Birmingham; Hans Renold, Ltd., Manchester.

Full details of the cutter dimensions for the manufacture of standardised chain-wheels are being prepared, and will be made public as arrangements proceed.



The new Premier runabout on the road. A detailed description of this little three-wheeler will appear very shortly.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

BELT PUNCHES.

Sir,—Looking through the advertisements in your paper, I notice that belt punches are never mentioned by any firms advertising accessories. Are these tools unnecessary nowadays, or are they still banned by D.O.R.A.?

W. G. CARDEW.

EASY STARTING.

Sir,—A very successful method of starting my motor cycle, which I have discovered, and may be of use to others who have the same trouble, is to carry a small oilcan full of petrol. As my engine has overhead valves, no compression taps are fitted and, priming being impossible, flooding is resorted to. To avoid this waste, I squirt petrol through the carburetter intake, which effectively drenches the gauze and slides, enabling a very easy start to be made.

Hoping this may be of some use to other of your readers.

Monmouth. M.O.H.V.

PRICES AND PRINCIPLE.

Sir,—There has been a lot of correspondence lately in the motor papers about the exorbitant prices asked for new machines, and I think it only fair that the names of agents who have stuck to list prices should be made known.

No doubt most of your readers know that I am one of the largest motor cycle dealers in England, and, as such, it has cost me hundreds of pounds to turn away the many enticing offers I have received. Nevertheless I have not sold a single new machine above the makers' list price, and hope that when things become more normal the public generally will not forget this important fact. S. JULIAN.

DISSOLVED ACETYLENE.

Sir,—The remarks of Mr. B. H. Davies in *The Motor Cycle* of September 18th on lighting arrangements lead me to the conclusion that he has never tried dissolved acetylene.

Since taking this into use in 1912 I have had no lighting troubles whatever, and it is difficult to understand why the majority of competitors in such arduous trials as the old London to Exeter night run prefer to carry two generators or a pocketful of carbide, when a D.A. cylinder, which will burn for twenty hours, would last out the longest night and require no attention at all.

To the normal rider it is very economical, as there is no waste, and an exchange will only be required every few months, depending, of course, on the amount of night riding.

When I stored my machine in 1914 my D.A. cylinder was about half exhausted, and on taking it into use again early this year it showed the same pressure, and I got a further two months' use from it.

No more messy carbide and water for me.

J. W. PEPPER.

COMPRESSION RELEASE V. EXHAUST VALVE LIFTER.

Sir,—The frequent references to driving on and burning exhaust valves raises the following question to me—Why fit exhaust valve lifting mechanism at all? Handle-bar controlled decompressors (two-stroke method) would fill the bill with advantage in lieu of lifting exhaust valves. Many inexpert owners are deceived when adjusting by poorly designed valve lifters partially lifting tappets, so that when the "postcard clearance" is obtained the valve is often deprived of its correct lift. Again, could we not expect better braking effect from the engine?

Running downhill with throttle closed and decompressors slightly opened (determined by experience), would not this give a retarding "dash-pot" effect to the pistons for three out of the four strokes, viz., suction, compression, and explosion? Also, a Bowden cable, releasing compression by this method, would give longer trouble-free service than one that has to compress two powerful exhaust valve springs.

Cylinder priming could be accomplished *via* this device even if fitted with pipes to silencer. GEO. MAGGS.

MOTORPHOBIA IN SWITZERLAND.

Sir,—I have just read in Current Chat your lines about motoring restrictions in Switzerland, and beg to inform you that the information does not apply to Geneva.

I am Genevese myself, and an old motor cyclist, and can tell you that there is no place where motor cycling is in such favour as in Geneva.

The mentioned prohibition refers to the neighbouring canton of Vaud, where restrictions have always been in vogue, as well as all sorts of taxations and prohibitions.

Kindly rectify, for the sake of the birthplace of the M.A.G. engines. CHARLES J. DE LAPALUD.

MOTOR CYCLING IN ASSAM.

Sir,—I have just received an appointment as engineer and general assistant to a tea company in Assam (India). As I have never been East before, I should be glad to receive information from any of your readers who have had experience with motor cycles in that part of the country.

(1.) I propose taking out an A.B.C. and sidecar, if I can obtain delivery before sailing in November or December. (I have had one on order since last March.) Would this type of motor cycle prove satisfactory in a hot climate?

(2.) Failing delivery of the A.B.C., would a Triumph be satisfactory, or is a chain-drive preferable?

(3.) Can insurance be effected in this country, or should it be done on the spot?

(4.) Will the machine have to be re-registered?

E. T. LYCETT BURD.

HAND BRAKES.

Sir,—Why, in these days of new models and altered design, do not makers fit a band brake with the orthodox quadrant and pawl as fitted to all cars? The foot brake may be accessible, but for my own part I should prefer a hand brake which could be put to stay on, on a long hill with a loose surface where the foot is being constantly jerked off the small area of the brake pedal, which makes a heavy machine with a big load no easy thing to handle at places like the Blue Bank, for instance, on the Whitby Road. I have never seen a standard machine yet which is fitted with this undoubted safeguard.

GILBERT T. COPP.

BUTSER HILL.

Sir,—I should very much like to know if any of your readers have experienced an apparent loss of power when ascending Butser Hill, and, if so, can they give a possible reason? I have done this ascent on very many occasions on really fine machines, but yet all seem to find a little trouble in getting up.

There is a slight down hill run from a railway bridge to this hill, and although I have "blinded" down this slope, and barely taken the bend at the foot of Butser, I find my speed reduced to almost 20 or 25 m.p.h. Yet I have made good ascents considering what others have been doing whenever I met anyone. (Perhaps someone with a "posh" machine will lie in waiting for me now.)

Now about a mile or so after Butser there is another similar hill, yet all machines positively roar up that one without any trouble whatsoever. B. S. NORTSUNBEAM.

Gosport.

SIDECAR SPRINGING.

Sir,—I notice on page 377 of October 2nd issue of *The Motor Cycle* a letter and illustration dealing with sidecar springing, signed by "C.M."

No doubt the conversion from the old type of springs on this sidecar to the type illustrated has been a vast improvement.

I feel it necessary, however, to point out to you that the suspension shown has been used on one of the Henderson model sidecars for the past four years, a patent being granted to me for this in 1915, patent number 2,514.

Although your contributor has used this type of suspension very effectively, I would point out that it seems hardly fair for users to use special features such as the one referred to, which are only associated with Henderson sidecars, in an attempt to make some other type of sidecar serviceable.

HENDERSON SIDECARS,
LEONARD B. HENDERSON, A.M.I.A.E., Managing Director.

SPARE PARTS.

Sir,—Regarding recent letters published in your valued paper *re* makers' attention in supplying spares, I hope you will publish this as it takes some beating. I undertook a journey from Leeds to Bridlington, and on arrival had it pointed out to me that the top part of my front fork spring was broken. I may say here that the machine acted so well with the spring broken that had I not been told I should not have noticed it. However, it being a 1919 model, I felt a little disappointed and wrote to the makers who sent me, by return, *free of charge*, a new spring, and new nut and bolt I had also lost (or, perhaps, had it begged). My machine is a 4¼ h.p. B.S.A. The Leeds agent, Mr. Armitage, has also shown most prompt attention to a little adjustment I wanted, although the machine was not supplied by him. Usual disclaimer. C.N.S.

Leeds.

Sir,—Many motor cyclists are now stating their experiences in regard to obtaining spare parts, and I would like to add mine.

I purchased a 2¼ h.p. Levis in December, 1915, and have ridden it continuously ever since; it has been a marvel. The makers, Messrs. Butterfields, Ltd., have treated me very well indeed. Stock spares have been sent by return of post, and I had a new double stay made leading from the seat-pillar to the back fork, fitted to the old frame, and delivered in seven days. I broke the threaded portion of my oil tap, and, as they had no similar taps, they offered to repair the old one. I posted it on the Friday, and had it back on the next Thursday, and no charge made.

I have been highly satisfied with Terrys, Ltd., who replaced a broken spring link by return. Also with the Lodge Sparking Plug Co., who promptly repair plugs at a very small charge, and who have replaced free of charge two defective plugs, one of which had been in use some time.

I may have been lucky, but I have not yet encountered a bad case of service up to now. J. FAIRLAM HORN.

Sir,—I have, in the immediate past, had occasion to require from the following firms various spares: Messrs. Alldays and Onions, Ltd., and Messrs. John Marston, Ltd.

Not only have I received the spares to time, far in excess of most optimistic expectations, but really courteous treatment as well.

I would specially mention the Sunbeam Co. for doing nearly the impossible for me, and by so doing making possible an enjoyable 1,000 miles tour. I would add the usual disclaimer. W. J. DARBY.

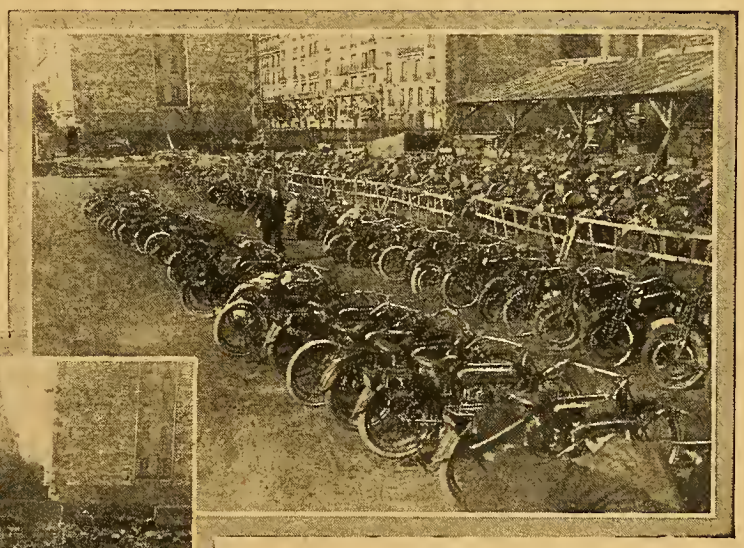
Rotherham.

Sir,—Recently I purchased a Big Four Norton, which has created a very good impression on all my friends, although in Bilbao singles are being superseded by twins.

During my first trip to San Sebastian the petrol tank began to leak, and was repaired on the road. As the job was not very well done, on my second trip the faulty tank leaked again.

I wrote a letter to Messrs. Norton, asking them for a new tank, and I am glad to say they have already forwarded a new one free of charge, not even trying to ascertain the truth of my complaint. As things are nowadays, we seldom hear that commercial firms treat their customers in this way, and, thinking this is very nice on their part, I shall always praise Messrs. Norton for their treatment towards me.

I have no interest in the above firm, but I am a satisfied owner of a fine machine.



SURPLUS MOTOR CYCLES OF THE AMERICAN ARMY.
(Left) Harley-Davidson sidecar outfits to be sold by auction in Paris.
(Right) Some of the British-made solo mounts used by the American Army.

If any of the English motor cyclists should ever come touring near the Spanish frontier of the Cantabrian coast, let them not be afraid of passing across. It may be that somebody will tell them that they will be murdered on the road, but these are eighteenth century stories. As long as they pass through villages with low speed they have nothing to fear. In a small town near San Sebastian several cars have been attacked with stones, but it must be stated that in a fortnight one person was killed by a car and two children injured on account of the terrific speed.

The roads of Guipuzcoa and Vizcaya are as splendid as the best roads in England, and scenery is very beautiful, abounding in hills four to six miles long. San Sebastian in summer time is one of the most attractive towns in Europe.

Bilbao, Spain. JOAQUIN URQUIJO.

BENZOLE IN THE ISLE OF WIGHT.

Sir,—In the interests of benzole users in the Isle of Wight, perhaps I may call the attention of the National Benzole Association to the absolute non-existence of their fuel here.

Occasionally, small consignments of the Anglo-American Oil Co.'s benzole arrives, but for the last two or three weeks there has been no benzole whatever in the Isle of Wight.

Merston, I.W. BENZOLE.

STANDARDISATION OF CONTROLS.

Sir,—May I suggest a precedent for the adoption of the carburetter control lever which opens outwards?

Consider the throttle and the air slide as valves (which, of course, they really are). Now the average valve used in general engineering practice is controlled by a wheel. When this wheel is rotated in a clockwise direction it closes the valve, and *vice versa*. This practice is almost universal, the history of it being, of course, its convenience for incorporation with the right hand screw thread. If the control lever is now considered as one spoke of the valve wheel, it is obvious that to move it outwards is equivalent to the anti-clockwise rotation, and should open the valve, while the inward movement, being clockwise, should close the valve.

Practically, I believe your contributor "V.A.H." makes a very sound case for the outward opening lever with his anatomical reasons, as I think anyone who has had experience of the Senspray thus arranged will agree.

S. LATOUR HORDLE.

Sir,—I am glad to see the interest you and your readers are taking in this matter. The subject of the standardisation of controls is one of the many points that are under the consideration of the British Engineering Standards Association.

I have the honour of being a member of the sub-committee dealing with this matter of the standardisation of controls on automobile vehicles, and shall be glad to see any further views that are expressed on the subject in connection with motor cycles, not only as to the carburetter control, but also brakes and clutches.

I may say that my view at present is that, apart from other considerations, the best arrangement in connection with the carburetter control is to make the movement of the throttle lever outward or upward to increase speed, and to make the movement backward or downward to decrease speed. But in these matters a great predominance in the use of an opposite form of control should have considerable weight. These, as I say, are my own private opinions, and I am quite prepared to consider and be swayed by what may be, in fact, standard by prevalence of practice.

Those of us particularly who are accustomed to ride a number of different machines, realise the necessity for some standardisation of control, as we often find that, having got used to one style, a change to another is very liable to lead to serious accidents if the controls are materially different in direction and operation.

DOUGLAS LEECHMAN.

THE A.C.U. TRIALS.

Sir,—I am rather surprised to see that "Ixion," in his "Occasional Comments" of October 2nd, rather suggests that a manufacturer should fit special engines and gears for the Six Days Trials. At any rate, that is how I interpret his remarks. Now, I have always understood that the A.C.U. set out, by means of this trial, to perfect the motor cycle, and, as clearly stated in their advertisement in your issue of September 23rd, to show the public which machines would be "good investments to the potential purchaser." This can only mean that the A.C.U. design their trial to test machines as and in the coudition that they are sold to the public, which object would be at once defeated by adopting the plan suggested by "Ixion."

The obvious deduction is that "Ixion" does not think the trial suitable to standard productions, and this is certainly supported by the fact that specially low gear ratios were adopted by some manufacturers for the trial. It would be an interesting addendum to the official results to have published a comparison of gears used in the trial and those issued on similar machines for public sale.

We must, however, ourselves plead guilty to a slight alteration of our machines, as the three which obtained silver medals had a low gear of 8 to 1, instead of 7½ to 1, which we usually use. Incidentally, our machines were geared higher on low gear than any others in the trial, and we are gratified to note that *The Motor Cycle* says that they "climbed marvellously."

Now the point I am coming to is this. As the A.C.U. advertises that machines which in this trial gain *premier* awards are good investments, it should take steps to see that only standard productions are used with standard engines and standard gear ratios, and, as a logical preface to this, it should select such a route as would be ordinarily used by ordinary riders. Freak hills and practically unused tracks necessitate freak machines, and so the A.C.U. itself defeats its declared object.

If I may impose upon your space a little further, I should like to mention one or two other matters connected with this trial.

1. DR. LOW'S AUDIOMETER.—It is not reasonable to introduce a new feature of this description into a trial which has world-wide influence without previously allowing manufacturers to test their machines against it. I submit that it has yet to be shown exactly what effect is produced on this instrument by varying the "note" of the exhaust. It is quite conceivable that a high note may lose a competitor more marks than a low note; but what manufacturer could possibly determine this? The test is obviously unreasonable, in my opinion, even though our machines came off excellently as compared with some others. I see that your photograph shows the instrument placed on the "near" side of the road, and I would like to ask whether *previously* a sidecar machine was tested both from "near" side and from the "off" side, and, if so, what difference could be noticed from the interposition of the sidecar which should have a dampening effect on the noise.

2. C.D.T.—This again defeats the object of the trial as defined by the A.C.U. advertisement, as it is purely a test of the judgment of the driver.

3. MARKS DEDUCTED FOR BRAKES.—It appears that marks were not deducted solely on the score that the brakes did not function effectively, but on the grounds that at least one of the judges did not approve of the type. If any particular type was going to be penalised notice should have been given, or marks should only have been deducted on actual results.

4. FINAL EXAMINATION.—I have asked the A.C.U. what allowance, if any, was made for the age of a machine, and await its reply with interest. Capt. Charlesworth states that his Zenith was four and a half years old, and he feels that he has a genuine complaint, as in the actual running he only lost four marks (and that on the C.D.T.), but lost his gold medal on the points deducted for silence (5) and final examination (7).

There are several other points in the trial which one could mention, but those above stated should perhaps open up a very interesting discussion as to the usefulness of this trial from the point of view of the private purchaser, in whose interests the A.C.U. says it designed and held this trial.

W. G. BOWER,
Director and Manager Zenith Motors, Ltd.

SUMMARY OF CORRESPONDENCE.

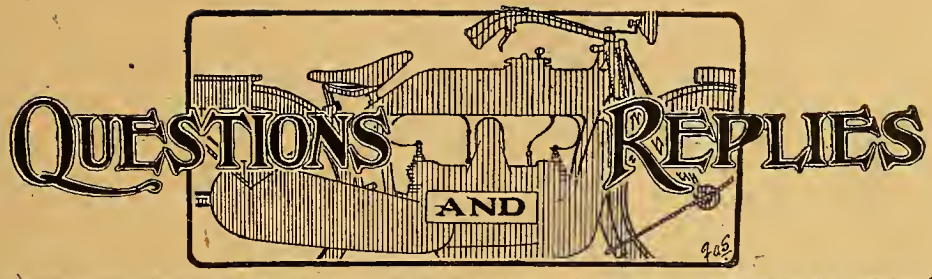
"A.C.H." has picked up a tool roll between Dover and Deal, and would like to return it to the owner.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with "*The Motor Cycle*."

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle, its care and management. Twentieth Edition. 286 pages. 400 illustrations	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Sixth Edition. (Second Reprint.)	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS. England and Wales. Scotland. London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case	4/6	4/10

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Broken Forks.

My mount is a 1913 3½ h.p. single, and I have had the misfortune of the fork breaking right across at the fork crown. Can it be brazed to be safe for sidecar work? If it is likely to be unsafe when brazed, can Druids be fitted?—P.S.

The fork could be repaired by refitting a new blade, if one could be obtained. Alternatively, you could fit Druid forks. The makers of the latter will supply you with all the information you will require regarding dimensions.

Welding a Gear Box.

I have a 1913 8 h.p. combination, and the gear box is cracked. It is impossible to get another, as the makers say they are now obsolete, and advise welding. Do you consider this will be entirely satisfactory?—S.H.P.

We should certainly recommend you to have the gear box welded. Several firms who are experienced in this work advertise regularly in *The Autocar* and *The Motor Cycle*.

A Story of Good Intentions.

I was travelling at 12 m.p.h. on a byroad which is in bad condition, and a cyclist was coming towards me on his wrong side. The road was badly rutted, but just where I was it was better than the part where the cyclist was. I put out my hand to show him that I would pass him on his wrong side, and thought he understood, as he did not alter his course until I started to go in the middle of the road to be able to pass him. He did exactly the same thing, so we crashed, and his machine was damaged considerably, but he himself was unhurt. My motor cycle was not damaged at all, but I was bruised and shaken up. He admitted his carelessness and went off. Ten days later he came to my father and claimed 30s. for the damage done to his cycle; this was paid to him, much to my annoyance. Was his claim legal, as he threatened to take the matter to court if he were not paid? He has no witnesses to call, as the place was deserted at the time of the accident.—H.E.R.

In the case you describe the cyclist was clearly to blame, but in the event of an action your case has been seriously prejudiced by the payment made by your father.

Speeds at Weston.

I should be obliged if you could tell me the record speed done by a motor cycle on Weston-super-Mare sands, also the type of machine and year when it was done?—E.C.

The record speed on a motor cycle on Weston-super-Mare sands in 1913 was one mile in 1m. 14⅖s. This time was accomplished by George Clarke (Rudge) and George Griffiths (Zenith), the Rudge in the 500 c.c. class, and the Zenith in the Unlimited class.

Gear Ratio.

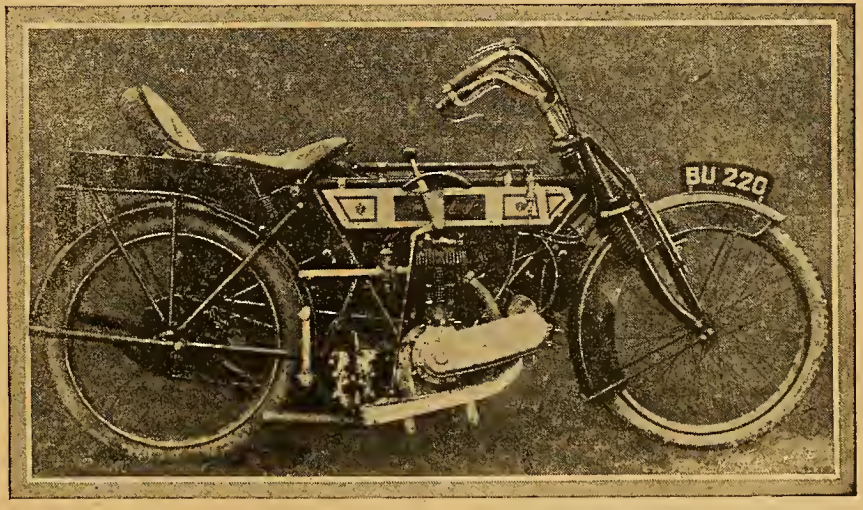
I have a 4½ h.p. coachbuilt outfit, all-chain drive, through a B.S.A. gear box. The numbers of teeth on the sprockets are as follows: Engine shaft 15, gear box (1) 35 teeth, gear box (2) 14 teeth, back hub 35 teeth. This makes a top gear of 5.8 to 1. (1.) What top gear do you advise if the machine is used chiefly for solo work? (2.) How many teeth on the second gear sprocket would be required to effect the change of ratio? (3.) The clutch slips, and all efforts to remedy it have failed. Are new plates needed?—W.A.B.

(1.) A top gear of 5 to 1 should be suitable. (2.) By the second gear sprocket we presume you mean the one giving the final drive. Seventeen teeth would give 4.8 to 1; sixteen teeth 5 to 1. (3.) Clutch slip may be due to the use of unsuitable oil, wear of the clutch plates, or weakness of the clutch springs. The most suitable oil to use in the B.S.A. gear box is the light gear oil specially made for the purpose. Heavy engine oil should on no account be used. If the plates are worn new ones will be required. See also "Reader's Reply" from A. E. Seamans, on next page.

Rudge Questions.

I have ordered an I.O.M. Rudge Multi. (1.) Of what speed should it be capable on the level and under fair conditions? (2.) Is it possible to lower the ratios, so as to give, say, a 4 to 1 top gear without making any structural alterations? (3.) Given fair treatment, is the multi gear entirely satisfactory as regards—(*a*) wear on belts, (*b*) belt slip, (*c*) its own wearing qualities?—R.A.G.

(1.) The T.T. Rudge-Multi should be capable of any speed up to 60 m.p.h. on the level. (2.) It is impossible to lower the ratios without making alterations to the machine. (3.) (*a*) If used judiciously without making sudden changes from low to high gear, the wear on belts is quite normal. (*b*) Provided the belt adjustment is kept in order, you will not experience slip under normal weather conditions. (*c*) The wearing qualities of the multi gear are quite good.



A new 4 h.p. single-cylinder Bradbury seen at a recent hill-climb in the North. Three-speed gear with chain drive is employed, and Mark II. Druid forks are fitted. The engine has been largely redesigned, having a simplified timing gear and detachable head.

R. Blackburn, 7-9 h.p. Harley-Davidson, who came in third in the recent Johannesburg-Durban handicap race. He covered the distance of 421 miles in 11h. 16m. 8s., an average of 36·8 m.p.h., establishing a new record for this blue riband event of South Africa.

Gear Adjustment and Jet Sizes.

I have a 3½ h.p. Premier combination. It has an Armstrong three-speed hub gear, which has two oil caps on the hub. (1.) Does one oiler supply the gears and the other supply the clutch, which is contained in the hub, or are both gears and clutch in a common chamber? (2.) What is the best oil for this type of gear? (3.) The quadrant carrying the three-speed lever has a notch between middle and high which does not appear to have been caused by wear, although it is very slight, but yet sufficient to keep the lever in that position. I have tried several adjustments to find out if the lever in this notch gives neutral, but there is nothing doing, and I can see no advantage in a neutral position when a clutch is fitted. What is the purpose of this notch? (4.) Can I obtain drawings of the gear, and, if so, where? The engine is fitted with a Senspray carburetter (without pilot). (5.) What is the size of correct jet? (6.) What would be the size of a pilot jet suitable for a 3½ h.p. single-cylinder engine? (7.) What are the approximate lowest revolutions obtainable on such an engine (running light) —*(a)* without pilot jet, *(b)* with pilot jet? (8.) What is the relation between numbered sizes of jets and diameters of holes in them, in, say, $\frac{1}{1000}$ths of an inch?—A.A.H.

(1.) That on the right supplies the clutch; the other, on the near side, the gears. (2.) Use rather thin lubricating oil. (3.) The notch X is a neutral position, and is used for adjusting the gear control. When the lever is in this notch the gear should be free—that is, with the clutch in. The back wheel should revolve quite freely and without noise. (4.) We do not suppose you can obtain drawings anywhere, as the company is no longer in business. (5.) A 38 jet. (6.) A pilot jet suitable for 3½ h.p. single-cylinder engine should be about .008in. in diameter. (7.) With a good carburetter on a single-cylinder engine in good tune, you should get perfect slow running without the use of a pilot jet; about 300 r.p.m. (8.) The carburetter jets are usually numbered according to the size in $\frac{1}{1000}$ths of an inch, although the numbering is not always strictly accurate.

Unobtainable Parts.

When placing grease in the gear box of my two-stroke Triumph motor cycle some metallic substance was apparently contained in the grease, which has stripped the pinions. Failing the ability of the makers to supply immediately, could you recommend any firm specialising in gear cutting where I could have the work done fairly quickly?—H.E.G.M.

We think it would be far better to wait for the manufacturers' parts for your Triumph gear box than to attempt to have them made by any other firm, as in all cases the makers are better able to secure interchangeability.

READER'S REPLY

Clutch Slip.

Re the enquiry from "C.W.R.E." in *The Motor Cycle* dated September 25th, in connection with "Clutch Slip," I think my experience of identical trouble in a 1915 B.S.A. machine may prove useful in effecting a cure. I repeatedly tried flushing with paraffin, fitting new plates, new springs, also additional plates and varieties of oil without making any appreciable difference. As a final resource, and to avoid returning the gear box to the makers, I removed the clutch drum and shaft from the gear box and made an examination, with the following result: I found that the keyways in the clutch drum were not smooth, and also discovered that the bronze plates were an easier fit in a certain position with regard to the keyways. I came to the conclusion that the trouble was caused by a binding of the plates in the keyways causing a slight buckling to take place when the spring pressure was applied, thus preventing the full area of all the plates to come into operation. As the clutch drum is hard, it is rather a difficult matter to remove any roughness that may be present, but a slight improvement can be made by rubbing the sides of the keyways with a small square stick of carborundum or similar abrasive. I carried this out until each keyway was without any roughness likely to prevent free movement of the plates, and then carefully selected the easiest position for each bronze plate, if necessary removing a little metal from the plates, also any burrs that could be detected on the plate keys. As a test, I made each plate free enough to fall through the keyways by its own weight, having the shaft in position to keep the plate square. The clutch drum and each plate should be marked to ensure that correct assembly is made when fitting into the gear box. Any plate that is not flat should be discarded. This method effected a perfect cure in my case, and I am now able to carry heavy loads up the steepest of hills without any difficulty. I was several months in finding out a cure for this annoying trouble, and feel sure your correspondent would be glad to have the full power of this splendid machine available once more. As a final suggestion, I would advise "C.W.R.E." to make quite sure that the clutch slip is not aggravated by belt slip.—A. E. SEAMANS.

RECOMMENDED ROUTES.

CONGLETON TO GLOUCESTER.—W.P.A.

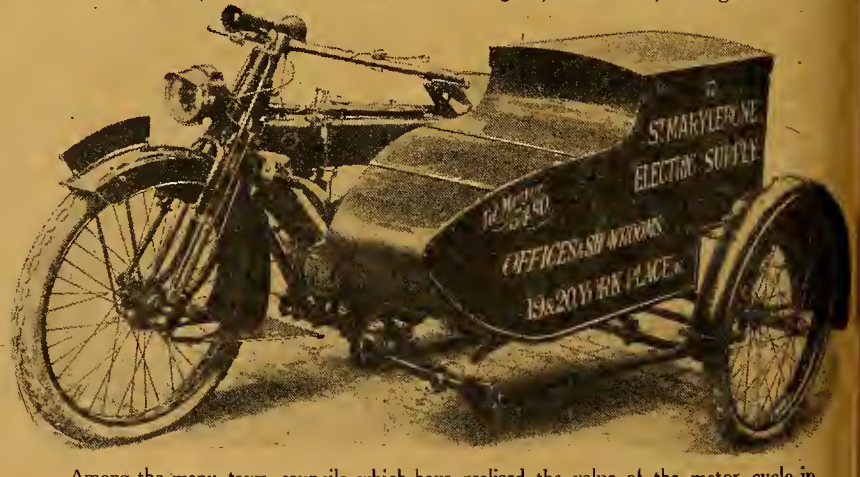
Congleton, Newcastle, Eccleshall, Newport, Shifnall, Bridgnorth, Bewdley, Stourport, Worcester, Tewkesbury, Gloucester. Approximately 120 miles.

BARGOED TO PORTMADOC.—A.D.

Bargoed, Abergavenny, Hereford, Leominster, Ludlow, Montgomery, Welshpool, Llanfair Caereinion, Dinas Mawddwy, Dolgelly, Barmouth, Harlech, Portmadoc. Approximately 140 miles.

LEICESTER TO GLASGOW.—I.M.

Leicester, Melton Mowbray, Grantham, Newark, Retford, Bawtry, Doncaster, Ferrybridge, Sherburn, Tadcaster, Boston Spa, Collingham, Harewood, Otley, Ilkley, Skipton, Gargrave, Settle, Kirkby Lonsdale, Kendal, Shap, Penrith, Carlisle, Longtown, Lockerbie, Moffat, Abington, Hamilton, Glasgow.



Among the many town councils which have realised the value of the motor cycle in municipal work may be mentioned that of St. Marylebone. The P. and M. shown is an outfit purchased for use in emergency service in connection with the repair o breakdowns in the Corporation's electrical circuits.

The *Indian* and GODFREY'S.

IT was in 1910 that Godfrey's entered into their first contract for "Indian" machines.

Ridden by the late O. C. Godfrey, the red "Indian" became a feature on the Brooklands racing track, and at all important trials, winning innumerable prizes and medals, and finding its way into favour with the motoring public all over the country.

For ten years Godfrey's, Ltd. have represented the "Indian"—each year contracting for larger numbers as the merits of the machine became more widely known.

It is gratifying for us, as agents, to look through our file of old advertisements, and to note how the laudatory descriptions written years ago have been borne out by time. Here is one advertisement written before the War, and not a single word needs revising:

There are motor cycles which proclaim their horse-power by roaring, reverbrating explosions.

There are machines where power is the master, and refuses to be governed in traffic.

With other motor cycles the sale price is not the whole price, and one has to spend money for speedometer, lighting set, and horn.

The "Indian" passes these on the road in dignified silence.

With the "Indian" power is the servant, and, governed by the pilot jet, makes riding in traffic an easy task for the veriest novice.

The "Indian" is fully equipped with electric head light, electric tail light, electric horn, and speedometer.

Godfrey's have contracted for a very large number of the 1920 models, and can with every confidence recommend them to their friends as the last word in power, efficiency and comfort

There will be two models :—

7 h.p. Spring frame, power plus twin, with electrical equipment,
4 h.p. Rigid frame, power plus twin,

and illustrations and specifications will shortly be available.

Don't delay placing your order. If you order at once you insure delivery in the early Spring, and the satisfaction of possessing a machine equal to any and every demand.

As a combination you will find our description (in 1913) "The express de-luxe of the road" not a mere figure of speech, but a statement of fact which experience will confirm.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1 %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

The Lighting Regulations.

WE never imagined that the absence of the red rear light on vehicles would be tolerated in this country for very long, but the return to sanity has come even more quickly than we thought. It behoves us to be very careful of what we write on this subject, for the vials of abuse have already been poured upon us from certain quarters, and statements which we never made and were never likely to make have been attributed to us, and then demolished with bitter logic (a method of carrying on an argument which always betokens a very bad case).

Because accidents have happened occasionally to cyclists and others carrying rear lights, it has also been argued that a rear light is no protection. This is, of course, absurd. It is true that some accidents have happened when rear lights have been carried (accidents have also happened in broad daylight, and are by no means always the fault of the overtaking motorist), but it must also be true that very many accidents have been prevented by the presence of a red light. When meeting a very bright light, such as is carried by many cars, it is almost impossible to see what else is on the road, unless it is lighted, and the head lights carried by cyclists can only occasionally be seen from behind. The pedestrian, certainly, is unlighted, but for some reason or other he is more easily seen than the cyclist; moreover, he can easily step on to the grass or footpath when occasion arises, which the cyclist cannot do.

We welcome also the return of the regulation making two head lights showing the full width of the vehicle necessary upon cars, sidecars, and other vehicles having two tracks. A single light should always denote a single track.

While on the subject of lighting, we should like to suggest to car owners the desirability of turning out their head lights while their cars are standing at the side of a road. A car standing on its right-hand side of the road and having dazzling lights is a very real danger, since there is a danger of oncoming traffic keeping to the left of the lights and colliding with the bank or footpath, whichever happens to be there. The same danger also exists in less degree when approaching from the rear, owing to the position of the tail lamp. Indeed, we think that it should be illegal for vehicles to remain stationary on the "wrong" side of the road after dark.

Olympia.

ALL keen motor cyclists and a mass of prospective buyers are looking forward with interest to the forthcoming exhibition at Olympia. November 24th, the opening date, is not far ahead, and this year's Show will undoubtedly be the most important event of its type ever held. The numbers of motor cyclists are constantly increasing, and manufacturers will have a difficult task to keep up with the demand. This fact must be borne in mind when studying 1920 models, for it forms one of the most powerful arguments in favour of the "no change" policy.

It is not suggested that no novelties will be exhibited, for we know of several ingenious and practical inventions which will be seen. On account, however, of the delay which would be caused by introducing entirely new models, many of the best-known British makers will stage machines which differ only in detail from previous models.

Startling departures from pre-war standards will largely be confined to young firms who have no production models to scrap. In future years this may prove a handicap to the old-established concerns, but this need not be the case provided that such firms get to work at once on experimental work and try out their ideas during the forthcoming year, so as to have something ready when the right moment occurs. Those who do not adopt this policy are likely to be left in the lurch, for the development of motor cycles will proceed by leaps and bounds.

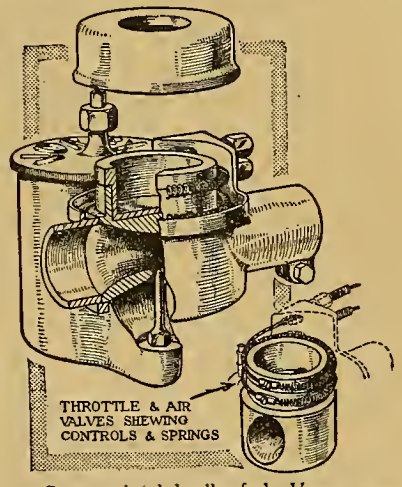
An index to the advertisements in this issue will be found on the page facing the back cover.

A SIMPLE CARBURETTER.

A VERY desirable form of carburetter for motor cycle use is, in our opinion, one which is to all intents and purposes automatic in its action, but yet provides a handle-bar lever for the occasional control of the air supply. Several carburetters on this principle have already been designed, and the Vortex carburetter, which we are about to describe, is a further addition to the list.

The throttle is a revolving barrel, through which an orifice is cut in the shape of a venturi tube. In the centre of the tube, at the bottom, is a small hole, below which the jet is situated, and at the top, sloping towards the engine at the full throttle position, a larger hole to admit extra air. When the throttle is fully open the venturi tube is in no way obstructed, as the jet does not project into it, as usual, but is placed just below. Throttle and main air, of course, open and close together, but the air closes slightly before the throttle. This causes a greater flow of air through the jet orifice, and provides a small amount of rich mixture, which is ideal for starting purposes and slow running.

The extra air is controlled by a smaller cup-shaped barrel which revolves in the



Constructional details of the Vortex carburetter. The inset shows how the throttle and air barrels are operated.

throttle barrel. This can also be used for priming the engine through the extra air orifice.

As the throttle, when wide open, provides a venturi tube to the engine without any obstructions the air will pass the jet at a high velocity and ensure complete atomisation of the fuel.

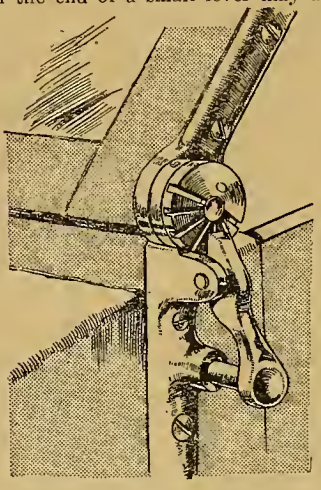
Supposing the engine is running at a moderate speed with full air, and it is desired to slow down for a corner, closing the throttle cuts off the extra air and provides a stronger mixture momentarily just when it is needed.

The float chamber is large, and is hollowed out right under the jet. There is, therefore, no small tube which might accumulate dirt.

We are promised an extended trial of one of these carburetters shortly, and shall then have something more to say of its performance.

A POSITIVE LOCKING WINDSCREEN JOINT.

A NEAT and simple locking device for the hinge of a windscreen is incorporated in the products of the R.V. Sidecar Co., 92, Humber Avenue, Coventry. It is designed to replace the usual joint which embodies wing nuts in conjunction with friction or serrated washers. The registering and locking arrangement consists of a disc having radial slots, into which the end of a small lever may drop.

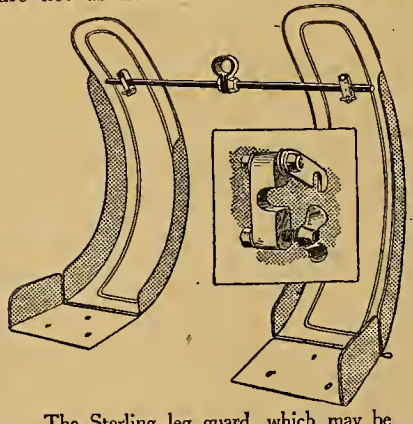


The R.V. windscreen joint which may be rigidly locked at various angles.

The lever is attached to the fixed part of the joint, and the disc rotates with the movement of the screen. The lever is normally engaged with the slots by means of a spring, and, in consequence, the screen is permanently retained in position, but is instantly released by pressure of the thumb on the outward end of the lever.

THE STERLING LEG-GUARD.

IT is at this time of the year that motor cyclists think of matters appertaining to mudguarding, and as the value of leg shields has long been recognised, it is rather surprising that such fitments are not as numerous on the market as



The Sterling leg guard, which may be fitted to any make of machine. Inset shows the method of fixing the guard to the cross-bar.

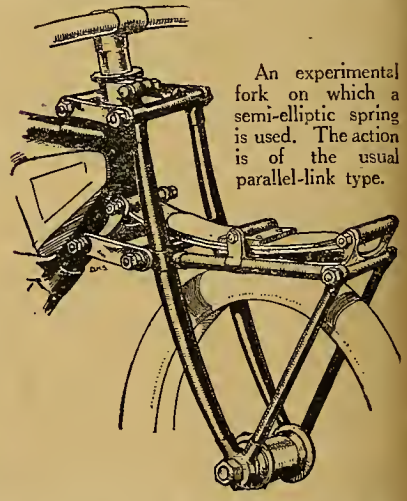
other necessities. Devices of this character are usually the product of the experienced rider, and the Sterling leg-guard illustrated is the patent of Mr. R. E. Wintle—a competition rider well known in the Midlands as a James exponent—who has a garage, known as the Highgate Motor Co., at Highgate Road, Moseley Road, Birmingham. The great advantage of this guard is the fact that it can readily be fitted to any make of machine, and once fitted can be removed and refitted in a few seconds.

As will be seen from the illustration, each guard consists of two parts coupled together by a simple form of hinged joint. The lower portion is fixed to the footboards, and the upper part may be swung round towards the rider to the most convenient position, and fixed by a crossbar clipped to the tube under the tank. A single nut fastens the crossbar to the tube by means of a split lug.

In the case of a machine fitted with footrests, the hinged portion is replaced by a long stud fixed on the end of the footrest support bolt. The guards are very well made (no solder being used in their construction) of rolled section, much after the fashion of some car wings, which adds to their strength and enhances their appearance. The retail price of the complete set is 50s.

A LEAF-SPRING FORK.

THE spring fork illustrated in the accompanying sketch is one which has lately been noticed on the road in the Midlands. It will be seen that a semi-elliptic spring is employed, and this is shackled at one end to the steer-



An experimental fork on which a semi-elliptic spring is used. The action is of the usual parallel-link type.

ing column and at the other to the forward portion of the triangulated wheel frame. The load is applied to the centre of the spring through a trunnion bearing. The design is quite neat and sturdy, and with suitable provision for greasing the shackle bolts, following car practice, should be long wearing and noiseless in action. Being above the position which the mudguard will occupy, the spring may be amply protected from mud and water. Since the motion follows the usual parallel-rule action, the only advantage appears to be in the elimination of coil springs, with their bouncing propensities and tendency to occasional breakages.

A Point About O.H.V.

THE technical experts have reminded us *ad nauseam* that valve steels have improved to a pitch at which a maker can guarantee there will be no valve fractures. Public timidity may or may not require these assurances; personally, I think we all perceive no maker dare sell overhead valves by the thousand unless he knew none of them would ever break. On the other hand, the user requires a word of warning. An overhead valve can do in a cylinder and piston without a fracture occurring; if the locking device of the valve spring comes adrift, there is nothing to stop the valve from dropping into the engine. Of course, the maker fully grasps this possibility, and guards against it by testing samples taken from every batch of springs, and also by using a suitable metal for his cotters or other locking devices. For absolute safety, therefore, it is essential that the user should not experiment with odd springs in the endeavour to get more power, nor improvise emergency cotters if he mislays the original fitting during an amateur overhaul. The toughness of these two parts is quite as essential to safety as the material from which the valve itself is made, and only the official spares should be used.

A Bag for Overalls.

I HAVE just paid some four guineas for a waterproof motor cycling suit. The tailor concerned assures me it is worth the money, for it is not only guaranteed to keep one bone-dry in a Scottish Six Days, but has a cut calculated to bring the most disdainful flapper to heel at the first wireless. If all this is true, I marvel much that it does not occur to the motor cycling tailors to supply dustproof cases in which such suits may be packed on the carrier. I am, therefore, now busy flaying an old armchair of its American cloth to construct such a case for the overalls as any practical manufacturer would supply with the clothes. This will, I think, fill the bill; but a murrain on that tailor, notwithstanding.

Waterproof Caps.

WHILE I am on matters sartorial, may I suggest to some artist in the tailoring trade that we motor cyclists generally look dreadful objects in wet weather. Omit the adjective "wet" from the last sentence, says some cynic. Pardon me, under normal circumstances we are distinctly handsome as a class. Our chins show determination, our nostrils courage, our eyes have a far-away, do-or-die expression. But in wet weather our typical beauty is camouflaged by a headgear. Who can appear presentable with half a yard of sodden tweed sagging over his scalp-line? Who can inspire romance when the slip-stream is hoisting the tailplane of his sou'wester so that the stout elastic hooked under his chin scarce restrains the hat from doing a vertical climb? The last rain-storm caused me to throw one of Tress's best tweed caps in the dustbin, and the one before had inspired me to present my sou'wester to the postman. I then splashed 10s. on a waterproof cap, replete with a neck apron and ear flaps. When it is fully rigged, I look like a cross between a hoopoe and a Bisley prize-man. When it is furled, I look such an appalling little tick that a newsboy would never call me "sir" if I gave him half a crown for a *Star*. Will somebody please design a headgear that will keep us moderately dry without making acquaintances ashamed to recognise us in the street? Incidentally, my expensive purchase does not ward the stinging raindrops off my eyes, nor yet stop icy rivers from trickling down my back. Its sole merit is that you can wear it more than once without its losing all semblance of being a cap. I ought to add that I had to purchase it by post, since no local garage or tailor had ever heard of the kind of maniac who takes a motor cycle out when rain is falling.

On Kick-starters.

A FEW weeks ago, I penned a note about the imperfections of the average kick-starter, and since then I have been carefully observing the conduct of the amateur riders among my neighbours. Not one of them ever uses his kick-starter unless he has to. It is obvious that anything is preferable to a push start if one is burdened with a heavily laden sidecar or stalled with a big solo mount in a dip between two fierce hills. Under these circumstances, anybody would try to operate the least effective kick-starter rather than employ the alternative method. On questioning the owners, their evidence was that their kick-starters were uncomfortable and uncertain. The pedal was usually either so high up or so far back that it was awkward to administer a hearty kick, and, as a consequence, the kick was generally feeble, and the engine failed to start. Take one of my own mounts as an example of bad practice. I can kick-start at the first attempt with some certainty if (a) the engine is warm, or (b) if the machine is tilted over sideways so that the pedal is not too high off the ground. Modern machines in the Six Days Trials, I was glad to observe, showed considerable improvement in the matter of kick starter design; one or two machines had entirely new mechanism—we progress! By the way, what are the A.C.U. judges doing with that much overdue Six Days Trial report?

Extraordinary enthusiasm is shown by the American public in motor cycle speed events. As will be seen from the illustration, a big crowd witnessed the start of the 200 miles "World's Championship Race" at Marion, Indiana, when riders of Harley-Davidson machines secured the first three places.

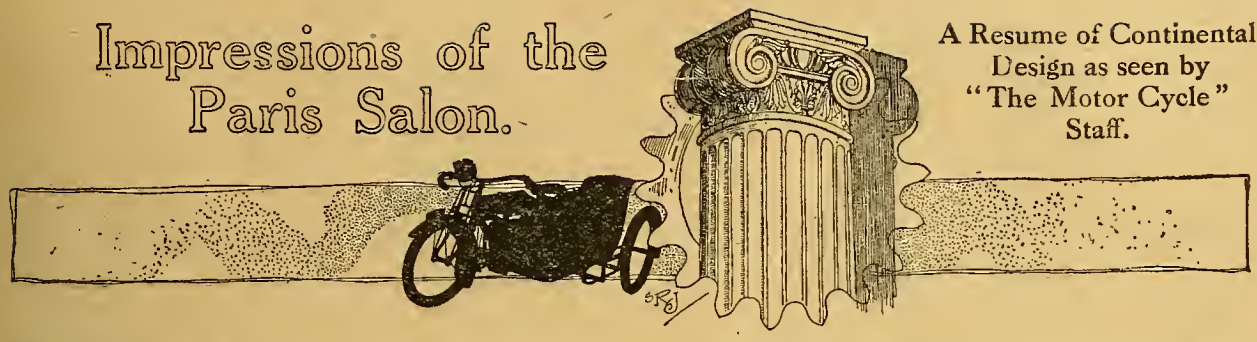
Reserve of Power.

IT seems only yesterday that I used to write and descant on the delights of reserve power. The biggest tourist machines of that era were always a little scared by the approach to any renowned hill; and no lightweight owner ever tackled more formidable going than the Great North Road. We have changed all that. At the termination of any big trial, freely sprinkled with the freakiest of freak hills, judges, reporters, and riders announce that they never opened their throttles fully on second gear; the most cumbrous and fully-equipped sidecar outfits come through the most searching routes without ever demanding full throttle on bottom gear, quite possibly without dropping below second gear. These novel experiences suggest two allied lines of thoughts. The first is that some of our bigger touring machines are either overpowered, or undergeared on their lower ratios. If a medium-powered touring car is put at a hill like Sutton Bank, it never has a great deal left in hand—certainly not a whole gear plus half the throttle opening. Smaller engines or higher emergency gears would fill our bill in very many cases. Secondly, the value of the gear box as a substitute for engine power is thrown into high relief. In 1914, when air-cooling was still crude, there were limits to the lowness of a gear ratio, or at least to the time for which an ultra-low gear ratio could be kept in engagement under load. These limits have been largely extended: and the outlook for lightweight machines is correspondingly bright. Excessive horse-power and under-gearing are the offspring of the dual-purpose machine, intended for solo and sidecar work indiscriminately. There is seldom a rational difference between the gear ratios supplied for the two kinds of service with any given engine.

Variations in Steering.

IN recent weeks I have described in some detail how enormously machines of several first-class makes differ as regards ease of steering. On normal roads and at normal speeds these variations are not tremendously obtrusive. But if a rider strays into rough by-lanes, or if he opens his throttle lavishly on main highways, he soon learns to distinguish between one make and another. There appear to be several factors in these variations; and as some of our correspondents display interest in the matter, I set the points out as they appear to me. The first is the efficiency of the front fork springs. It is obvious that a rider cannot coax his machine delicately if his front tyre is only making periodic contacts with the ground. The second is the distribution of weight; one and the same machine may evince different steering qualities according as it is fitted with dropped or raised bars, the former throwing more of the load on the front wheel, and thereby accentuating the leverage which it exerts over the hinder part of the machine. The third is unquestionably the design of the fork, irrespective of its springs. Wheelbase should probably be added to this list. Translated into practical terms, the difference may be such that on machine A one never thinks of steering, but performs it as subconsciously as one walks; whereas on machine B any patch of awkward going—ruts, grease, stones, etc.—puts the wind up a rider and makes him tighten his wrists.

Impressions of the Paris Salon.



A Resume of Continental Design as seen by "The Motor Cycle" Staff.

SINCE the earliest days of motor cycles, when Continental manufacturers led the way and British experimenters copied, there has been a steady reversal of *rôles*. Design in this country, after a period of difficulties, went ahead by leaps and bounds, whereas Continental designers appeared to concentrate on cars, and the motor cycle industry lost ground.

As a direct result of the improvements in motor cycles, an important industry sprang up in England, and its products reached almost every corner of the globe. More recently America became a serious rival, but though a few first-class motor cycles have been produced in France, Belgium, and Italy, British machines have been adopted as patterns by most European designers.

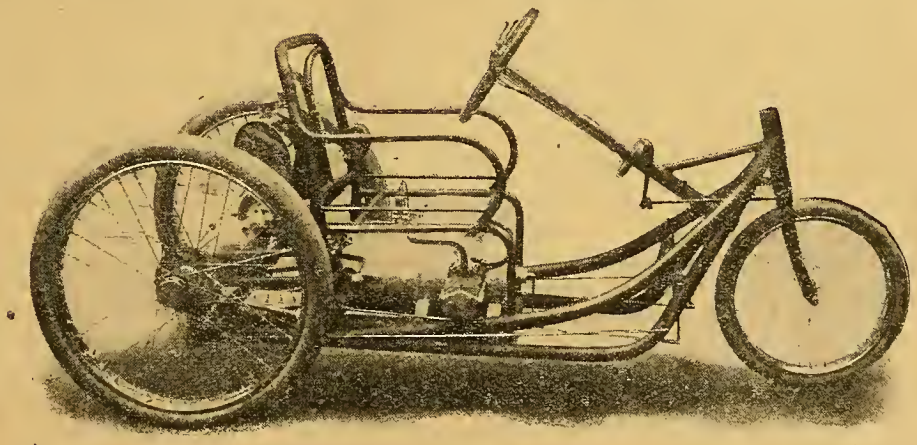
The war has been responsible for many changes, and has brought into prominence the extraordinary capabilities of the motor cycle to such an extent that we find that France is once again taking a lively interest in the production of two-wheelers, and not only is she taking advantage of British and American improvements, but also she has introduced many original features of her own.

This is only as it should be, for a country of such brilliant mechanical genius is not likely to allow other nations to have things all their own way in the world's motor cycle market. So great are the differences that it is not an easy matter to compare the motor cycle exhibits in the Grand Palais exhibition of 1913 with those of the 1919 Salon.

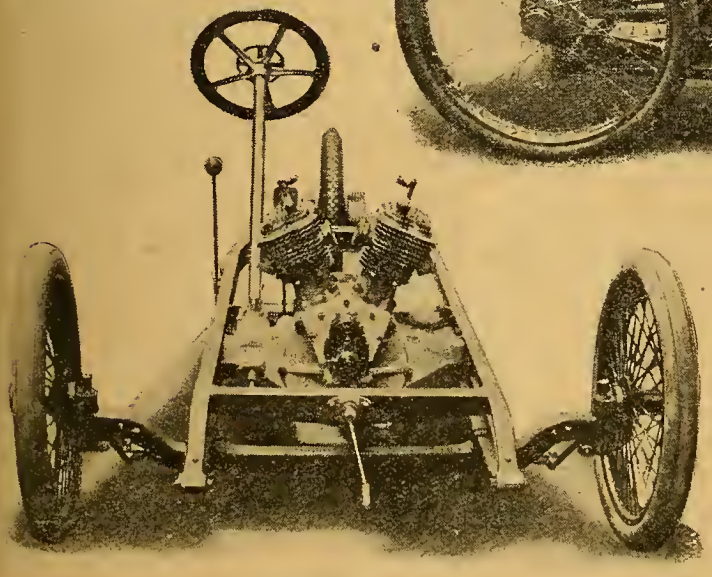
In 1913 there was, it is true, much originality, but the few exhibitors had not learned how to make a neat and workmanlike machine, though some of the mechanical features showed great promise.

In 1919 neatness of detail is an outstanding feature, and some of our own manufacturers might well take a hint from French designers in this respect.

FRENCH DESIGNERS TAKE UP THE THREE-WHEELER.



The Barrellier, a three-wheeler fitted with a flat twin two-stroke engine.

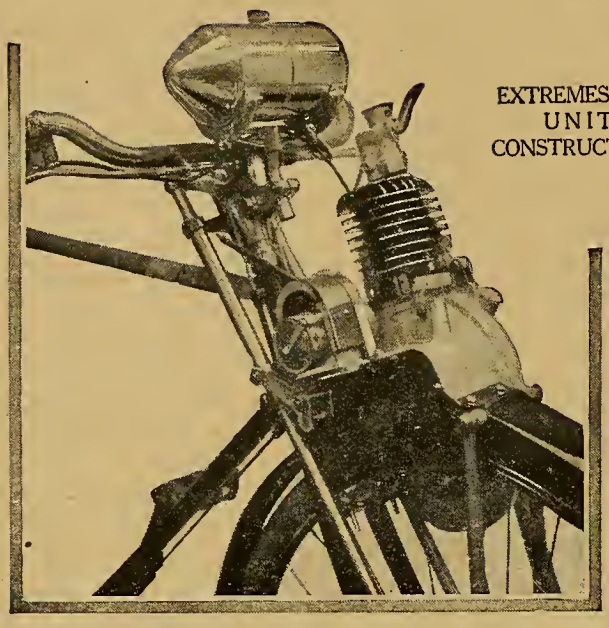


The Diable, a three-wheeler of sound design and construction.

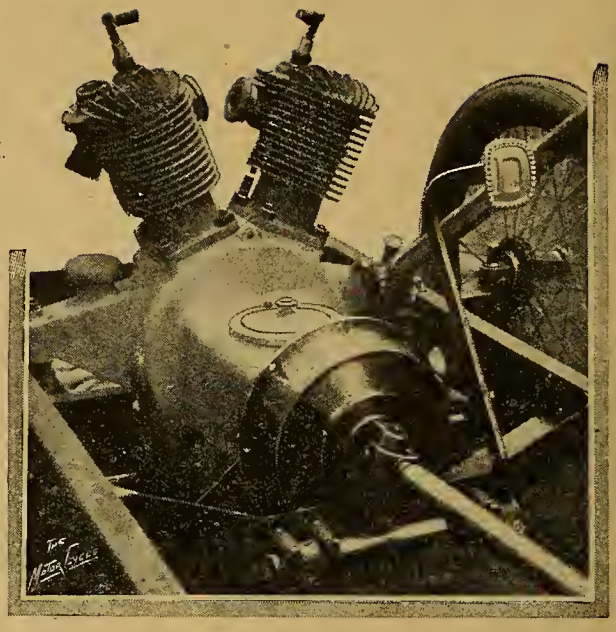
Novel Lines.

It is true that the majority of French machines differ in general appearance from the lines to which we have become accustomed, but they are not necessarily any the worse for that. One is apt to get into a groove and consider as a freak anything that does not conform to accepted practice, but this is quite a mistaken attitude to adopt, and, unless other people's ideas are carefully studied, we shall find that, not only will our export trade fail to increase, but that new and dangerous competitors will arrive in our home market.

EXTREMES OF UNIT CONSTRUCTION.



The Cyclotracteur, specially designed as an attachment to pedal cycles. Transmission is by friction drive on to the front tyre.

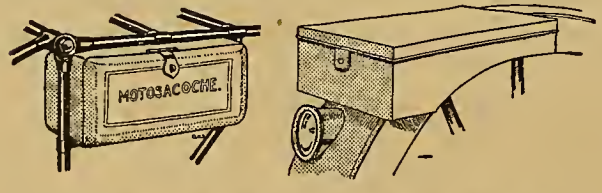


An extremely neat 8 h.p. engine and gear box fitted to the Diable runabout.

Perhaps the most noticeable tendencies of modern French design are the prevalence of unit engine and gear boxes, and rear springing. The former is a point on which there has already been much discussion, and which, in our opinion, is eminently desirable; the latter is a feature which is universally accepted as a desirable point in standard equipment.

Unit Construction.

Let us dwell for a moment on the possibilities of unit construction as exemplified by the Blériot, Louis Clément, Alcyon, and other machines. First, it is possible to construct a clean unit in which the primary drive is entirely enclosed and runs in an oil-tight compartment; next, the unit can be made in such a manner as to present a clean and smooth exterior which will collect a minimum of dust and mud and will be easy to clean. It should also be possible to save a certain amount of weight, especially in the matter of attachments, and, if the magneto is carried on the top of the gear box, a further saving is effected in the weight and cost of a special magneto bracket.



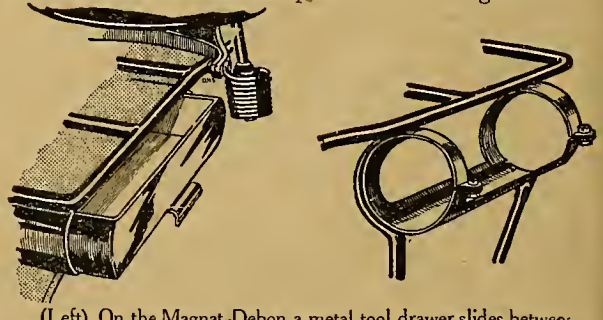
(Left) One of the neat metal pannier tool cases on the Motosacoche. All the angles are rounded off and the finish harmonises with the rest of the machine. (Right) The flat top of the tool box on the Louis Clément forms the carrier, and is integral with the mudguard.

Against this must be set the fact that more work is entailed if it should become necessary to strip the entire engine for examination. But how many touring motor cyclists ever remove more than the cylinders? And, if the engine is periodically examined, the gear box usually undergoes the same operation at the same time, or at any rate it should do so.

Frame Design.

Some alteration in frame design might be necessary, but this is a good point rather than otherwise, as, though modifications of the diamond frame have proved satisfactory if sufficient metal is employed, it by no means follows that it is the best and lightest construction.

The frame of the Louis Clément motor cycle is an example of advanced construction, being largely constructed of steel pressings, and yet conforming in a great degree to general outlines of standard motor cycle practice. In this machine the tank rails and saddle tube are discarded in favour of pressings, which form, in the first instance, an admirable platform for the tank and saddle fixings, and, in the second case, a combined rear mudguard and frame stay. Again, the front forks are of pressed steel, and are light, strong, and easy to clean, and the combined toolbox and carrier are formed as part of the rear guard.



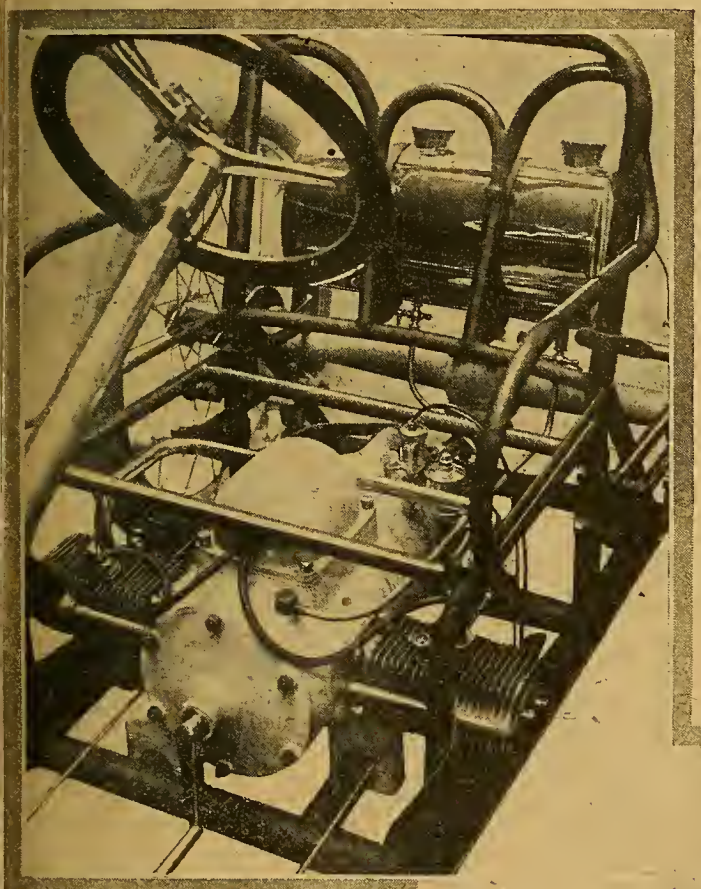
(Left) On the Magnat-Debon a metal tool drawer slides between the carrier and mudguard. (Right) The carrier stays of the G.L. embody large diameter clips, which are adapted to receive either a standard D.A. cylinder or a tubular tool case.

mpressions of the Paris Salon.—

Pressed steel frames are, of course, only suitable or mass production, but, given favourable circumstances and good design, they save weight, money, and cleaning, and provide a most admirable form of construction.

Disc Wheels.

Both Clément and Blériot motor cycles are fitted with permanent disc wheels, the rear wheel of the Blériot with its integral belt rim being a particularly fine piece of work. Opinions are divided as to the merits of this type of wheel for solo riding; but for sidecar work, at any rate, the permanent type has its advantages.



Showing the layout of engine and gear box of the curiously designed Barrellier runabout.

Carrying the Tools.

As already mentioned, details have been cleaned up to a large degree, and considerable ingenuity has been displayed in the construction of tool-carrying arrangements.

The Magnat-Debon is perhaps the neatest in this respect, having a shallow drawer below the carrier with a compartment for each necessary tool and spare part; but if steel pressings were used, it should be possible to construct the lid of the toolbox so as to form the carrier, and thus save a number of parts and joints.

Circular metal boxes on either side of the carrier are used by the G.L., and either may be replaced by a D.A. cylinder if desired; and the new Motosacoche provides perhaps the neatest example of an entirely armoured toolbag.

Rear Springing.

Rear springing systems of all types were to be seen, from the leaf spring systems of the A.B.C., Janoir, Griffon, etc., to the type which insulates the rider only, as exemplified by the Motosacoche, Condor, Viratelle, etc. In between come such devices as those employed on the Blériot. This particular example is very neat, the springs being entirely enclosed in the frame tubes, and an adjustable friction device being incorporated in the link action.

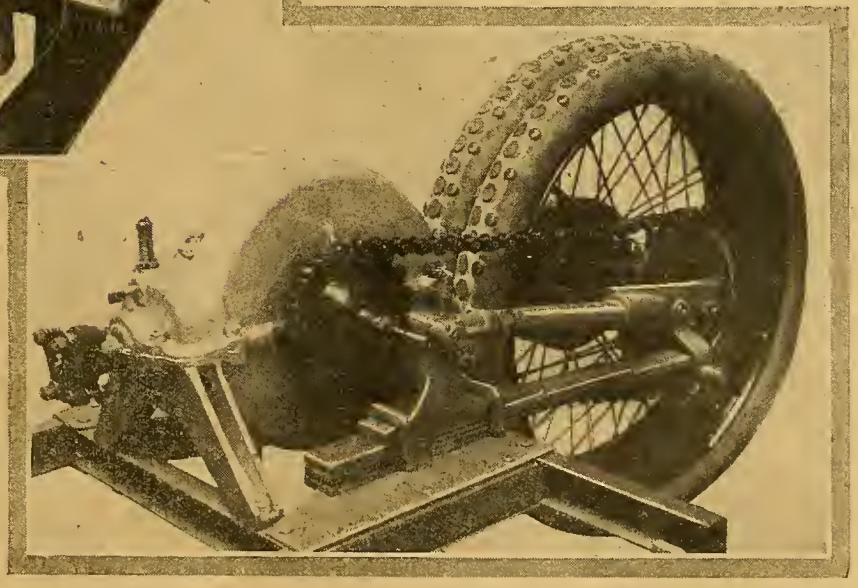
The Magnat-Debon employs a spring saddle-pillar in addition to a spring frame.

Most Continental motor cycles have two brakes operating on the rear wheel: an item which is influenced to a certain degree by the design of spring forks.

Engines.

Engines show rather an interesting trend of thought, for there is a decided tendency to adopt the side-by-side vertical twin both for two and four-stroke types.

One of the best examples is that installed in the Blériot motor cycle. Both connecting rods are mounted on a common crank pin, so that the impulses are evenly spaced, though the balance cannot be better than a single. Detail engine design is good, with the curious exception that adjustable tappets are rare, and very



The springing of the Triauto Godet three-wheeler

Impressions of the Paris Salon.—

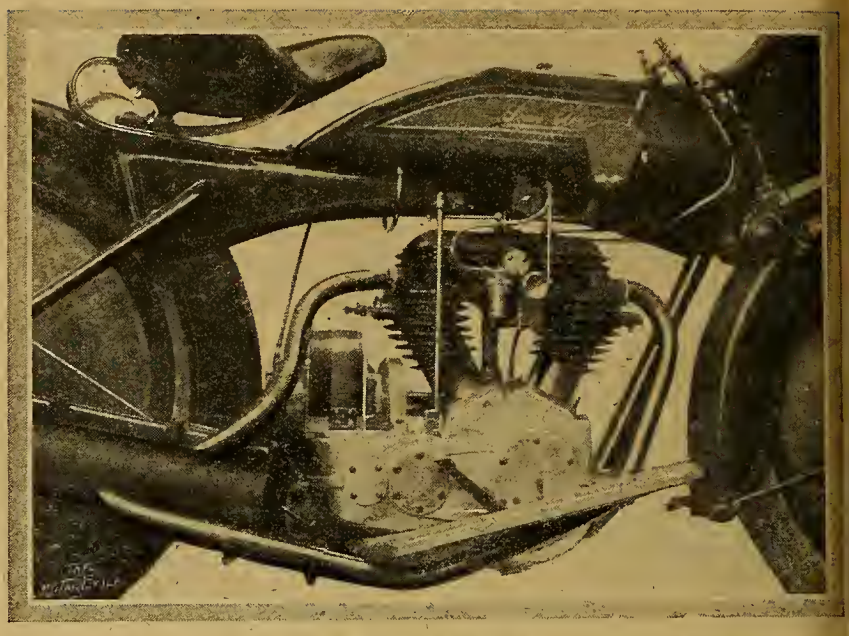
small diameter valve springs are employed.

The Viratelle is alone as a water-cooled motor cycle engine, and, though only a single-cylinder machine was staged, a vertical twin cylinder is also made by the firm. This machine is interesting, too, on account of the very neat three-speed epicyclic gear embodied with the engine unit. Horizontal twins were shown on the stands of Janoir, Magnat-Debon, and A.B.C., the last being, of course, similar to the English A.B.C., but built by the Gnôme and le Rhône Co.

Two-strokes.

Of the French two-strokes, the Alcyon is the most interesting (described in our last issue), though the Motosolo is a very neat machine of the lighter class.

Pedal cycle attachments are common and uniformly ingenious. This subject seems to have received greater attention in France than in this country.



The power unit of the Louis Clément, the three-speed gear box of which is integral with the crank case.

Three-wheelers show great originality, though, in the main, the designs would not attract British buyers. An exception, however, is the cycle car Diable. This has a very sound and straightforward chassis, and the layout is about the last word in practical simplicity.

In conclusion, there are many lessons to be learned from modern French designs, and though, perhaps, we could teach more than we could learn, it would be most unwise to pass by the possibilities without very serious consideration.

Fuel Economy and the Jet.

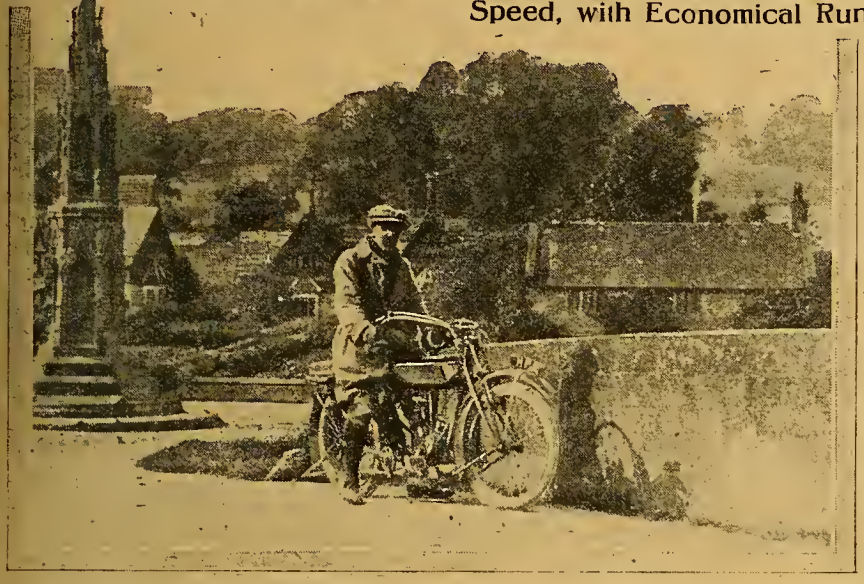
A Few Notes with Reference to Carburetter Timing.

CARBURETTER manufacture and designing are, in these days, a highly specialised business, and it is as well for the ordinary rider to bear in mind, when tuning his machine, that, however excellent his knowledge may be as regards the carburetter he favours, he naturally knows a good deal less about it than the man who designed and made the instrument. If a machine is giving good results, it is generally impossible to improve matters by tampering with the carburetter. Many riders suffer from the delusion that herein lies the secret of super-tune—nothing of the sort. Super-tune is chiefly a matter of workshop experiment, requiring more than insulation tape and a pocket "King Dick," and, given the proper size of jet, clean gauzes, etc., the rider can rest pretty well assured that the makers of the instrument have seen to it that the petrol level and so forth are set to the best all round advantages. Having said so much, I will now proffer a little encouragement to those who, anyway, will ignore the above, and whose old machines, sold to juvenile cousins, are now suffering from senile decay brought about by excessive carburetter tinkering in their youth.

Carburetters, like life itself, are a compromise by which one can obtain a variety of different results in a variety of different ways. The most common error with regard to them is concerned in the size of jet. Nearly every rider is of the opinion that a weak mixture—or rather that a small jet—naturally means fuel economy. He loses sight of the fact that there are two common ways in which a petrol engine can be governed—one by regulating the *strength* of the charge, and the other by regulating the size of the charge. If the mixture is too weak, it is necessary to admit a much larger charge to the engine than if the mixture is correct, and more petrol is used by running on a weak, large charge than by running on a small and moderately rich charge. Moreover, the engine runs hotter on a weak charge, does not tick over so comfortably, uses more oil, is liable to knock, and generally experiences a rougher time than if a jet of the proper size were used. Therefore the gentleman who goes to some pains in order to sniff down the amount of petrol going through the jet must not imagine that thereby he is sure to save his pocket. Variable jets—excluding the variety regulated with the throttle—are all right if intelligently used, but there is usually more to be gained by running on a large jet with a small throttle opening than by using a small jet and having to bang open the throttle in order to obtain a few ounces of extra power. Personally, I have found that a really vigorous kick, consistent with the amount of petrol consumed, is most easily arrived at by employing a low petrol level and a large jet, although with this setting the engine is at its best chiefly at high speeds. CHINOOK.

Road Experiences with a Rudge-Multi.

A 350 Mile Test of a Standard 3½ h.p. Sporting Solo Mount. Comfort and Speed, with Economical Running.



The 3½ h.p. Rudge-Multi on the bridge at Ilam, a picturesque village in Dovedale, Derbyshire.

AMONGST the ever-changing variations of design introduced by our leading manufacturers from year to year, it is not without interest to enquire into the reasons which have induced one or two firms to adhere to an originally conceived layout during an extended period.

Such an instance is found in the policy of Rudge-Whitworth, Ltd., of Coventry, who have remained faithful to the same specification, barring slight detail improvements, since its inception. A recent test run on one of their standard roadster multi-speed models amply demonstrates the reason for their conservatism.

For the high speed tourist, and it is mainly to meet the demands of this class that the machine is offered, nothing more is to be desired than the combination of a lively engine with a simple form of transmission, allowing the use of an exceptionally high gear for the open road and a low enough ratio to enable any main road hill to be climbed with certainty or to render traffic safely negotiable.

The 3½ h.p. Rudge-Multi unites these desiderata in the form of the well-known overhead inlet valve engine and the ingenious multi-gear which permits the selection of any ratio between the limits already mentioned as necessary. A standard touring model drawn from a batch of fifteen which passed off road test in the ordinary course the same morning was placed at our disposal. The starting was accomplished with one downward pressure of the starting pedal, the throttle of the Senspray carburetter being one-quarter open, and, after noting that the pannier bags had their usual equipment of an excellent tool kit and repair outfit, we left the works for an eight-mile spin to get the "feel" of the riding position and controls.

This was soon acquired, thanks to the perfect steering, which is attributable to the spring fork design and scientific rake of the head. Incidentally, we have always considered the steering of the Rudge to be beyond criticism even at the highest speeds. Complaints of "speed wobble" have arisen on occasion, but we found the present mount totally free from this defect. This was possibly owing to the three-rib tyres fitted, which, we were previously informed, eliminated the directional uncertainties sometimes experienced when other pattern tyres were used.

Next morning we left Coventry at 6.30 to witness the open one-day trial of the Redditch M.C.C.

The whole course of 150 miles was covered, excepting one short stretch containing abnormal hills requiring a low gear of at least 10 to 1. Being a brand new engine, it was deemed wise to pay repeated attention to the oil-pump pedal, conveniently situated below the right footrest, and, as a result, two stops due to a sooted plug were experienced.

A journalist's mount comes in for much rough handling, since, after observing on one hill, it is necessary to "blind" on to the next in order to overtake the field. The Rudge was equal to this treatment, and showed no falling off in tune at the end of the day.

Two hundred and twenty miles were covered altogether, and, owing to the comfortable riding position obtained by drop-pedal device, not the least fatigue was experienced.

Twycross Church, one of many peacefully rural scenes encountered on the test run of the 3½ h.p. Rudge-Multi from Coventry to Dovedale.

Road Experiences with a Rudge-Multi.—

The following day being fine, a run to Dovedale was undertaken over roads which, though narrow and twisty, are singularly free from traffic and towns. Owing to the experiences of the previous day, which showed that the Rudge engine enjoyed "revving" when climbing, the gear was lowered early on hills, thus enabling a better average speed to be maintained than is possible by hanging on to top gear. Sudden changes should also be avoided, as nothing is more conducive to excessive wear of the belt ends.

After taking a few photographs in Dovedale, admiring the scenery and enjoying tea, the homeward run was commenced in the cool of the evening, and Coventry was reached in extremely good average time considering the nature of the narrow tortuous lanes.

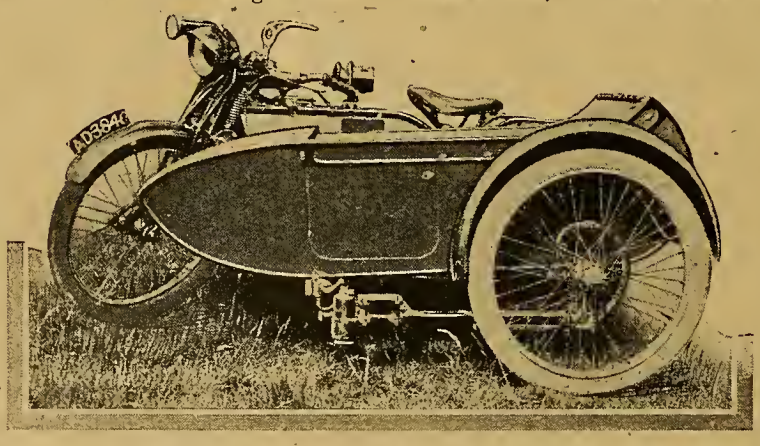
On our return the general condition of engine and fittings was carefully observed. Nothing untoward was noticed. The crank case, which is a much cleaner casting than of old (indeed all the external finish is thoroughly good), was practically free from oil; the adjustments were all in order, the cycle bearings entirely free from shake, and even the dull plating of the exhaust pipe was quite untarnished, thus proving the cool running of the engine.

The belt was in good condition and tight, although had it stretched it could easily have been adjusted by the neat little tension device at the end of the rear axle, without having to cut the belt. Petrol consumption for the 350 miles total running was three and a half gallons—an excellent result amply demonstrating the economy of running on high gears.

SIDECARS FOR LIGHT MACHINES.

Some Mechanical Details Frequently Overlooked by the Owners of Low-powered Outfits.

THOUGH in these days motor cycles are so excellently designed and constructed that, with proper attention, no harm results from reasonable overloading, it is quite as well that one should realise fully just what is being asked of the machine when it is put to a use for which it was not intended. How many motor cyclists realise what enormously increased strains are put upon the machine when a sidecar is attached? A large number of riders seem capable of thinking no further than their engines, and so long as they have engine power enough and to spare for solo use, they talk about "sticking a sidecar on it," as one would talk of sticking a coat of enamel on the handle-bars. Indeed, it can be said that the average motor cyclist is quite a good engineer as regards his motor, but an appallingly bad engineer as regards his cycle, and when it comes to attaching a sidecar to a solo machine, the engine, in these days of three-speed gears and excellent design, is by no means the most overtaxed member of the machine. "Change early and keep up your revolutions," and any amount of sidecar slogging is not likely to harm the engine, but unless the cycle is strong enough for the purpose it must inevitably suffer. I do not, however, mean entirely to discourage the use of sidecars with machines which are primarily designed for solo riding.



A lightweight sidecar de luxe—the Richmond, a Bristol production—attached to a 2¾ h.p. Douglas, with which it forms a most attractive lightweight outfit.

Wheel Bearings.

Take, for example, the wheels. In solo riding the wheels and wheel bearings are opposed to no side strains whatever. When cornering the machine leans one way or the other, so that the spokes are always directly in tension, but when a sidecar is attached very considerable side strains are in operation the whole of the time. These strains are, of course, at their greatest when taking a corner, for the machine is now rigidly upright at all times, so that the whole of the energy expended in turning the outfit from a straight course to a curved one falls in the way of side strain on the hub members.

It is rather remarkable that the ordinary type of motor cycle wheel bearing stands up as well as it does on sidecar machines, for it is not designed to meet these strains, and as a rule it suffers from neglect.

When attaching a sidecar, then, the first thing is to bear in mind that you are increasing the wear and tear on the wheel bearings by more than 100%. These bearings, therefore, should be carefully watched for slackness, which must be taken up immediately or the bearing will deteriorate very rapidly indeed. Given proper attention, they should not suffer unduly, but if ridden slack it only needs the introduction of a little grit, and new bearings will be required within a month.

Of course, the third wheel of the sidecar relieves the motor cycle wheels of some of the weight, but it is generally ridden on a softer tyre than the other two, and it does not do its share. Motor car wheels are set at a rake and provided with special bearings to meet these side strains, and they can be very considerably reduced by aligning the motor cycle so that it leans slightly out of the vertical and away from the sidecar.

CHINOOK.

A Wonderful Lightweight Performance.

An Examination of the 2¼ h.p. Levis which obtained a Gold Medal in the Six Days Trials.

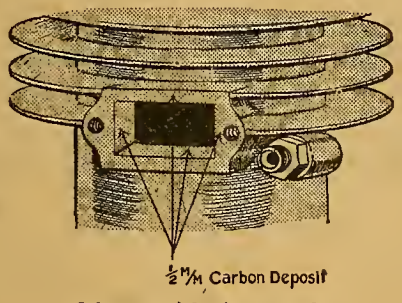
P. Pike and the 2¼ h.p. Levis, on which he qualified for a gold medal in the Six Days Trials.

ONE of the features of the recent A.C.U. Six Days Trials was the consistent performance of some of the little two-strokes. So marked was their success that it made a deep impression, not only on the thousands of prospective lightweight owners, but also on manufacturers, both British and Continental, who took a keen interest in the trials with a view to future productions. Our readers will remember that on the way to Llandrindod Wells the latest model Levis had the misfortune to develop tank trouble of a sufficiently serious nature to spoil its chances of competing successfully in such a strenuous trial. Nothing daunted, Mr. Pike, the well-known Levis exponent from the West Country, decided to ride at all costs. As a consequence a telephone message was sent to the firm's works at Stechford in the hope of obtaining another mount.

It happened that the only available machine was a standard 2¼ h.p. Levis, fitted with specially low gear ratios, which Pike had been using for certain lubrication experiments. This engine, we are told, had already about 3,000 miles to its credit, but, nevertheless, it was hustled off to Llandrindod by road. On arrival the cylinder was removed and decarbonised, and the machine was cleaned up and adjusted preparatory to competing in this trial of trials.

The performance of the 2¼ h.p. Levis throughout the event is now a matter of history, and it is sufficient to state that no hill proved too much for the engine with a low gear of 15.2-1, and, although the top gear was 6.4-1, Pike succeeded in keeping up to time throughout.

At the conclusion of the trial the machine was ridden back to Stechford, and we took charge before the seals were broken in order to satisfy ourselves that the engine had lost none of its tune. After a few minutes' inspection in the works, we passed out into the Birmingham traffic, and on this occasion, as on subsequent trips, the little engine behaved perfectly.



Inlet port of Levis two-stroke.

Two features which may rather surprise those who are inclined to disparage two-strokes were the remarkably low consumption of fuel and oil. We were told by Mr. Butterfield that the consumption of petrol throughout the Six Days Trials had been in the neighbourhood of 125 miles per gallon, and though we were unable to make an accurate test, we can truthfully state that our experiences went to show that this was not an exaggeration. Owing to the Levis system of lubrication, in which oil is fed directly to the piston and main bearings, a minimum quantity is wasted, and we were particularly struck by the small amount which was necessary to keep the little engine running sweetly.

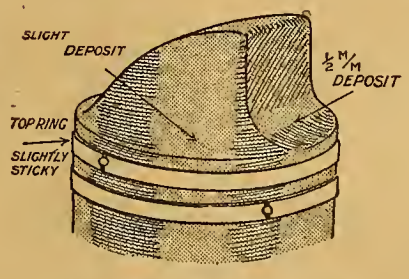
An Examination of the Engine.

After a week of short trips the machine was returned to the makers to be stripped under our observation, and for the first time the A.C.U. seals were broken. As might be expected, the greatest accumulation of carbon was on the deflector, but even here we could find no spot where the deposit was perceptibly over ½ mm. deep. The piston head was almost free from deposit, and the underside of the piston had but a moderate coat. The exhaust port, which is usually the first part to cause trouble owing to excess of deposit, was remarkably clear, and the average depth of carbon was approximately ½ mm. distributed evenly over each surface. The top piston ring was rather gummy, but was easily freed by the fingers.

Next we examined the bearings, which were in excellent order throughout. Even after washing all oil from the surfaces there was no more perceptible play in the crank bearings than might be allowed in manufacturing limits. There was just perceptible rock in both big and small end bushes, but no lift. Every wearing part was carefully tested with a micrometer, a standard Levis engine being used as a pattern, and the greatest variation was within the error allowed by manufacturing limits.

When the piston was measured we felt sure that some symptoms of ovalty would be evident after such a severe trial, but the difference between the smallest and largest diameters at any level was only .00075in.

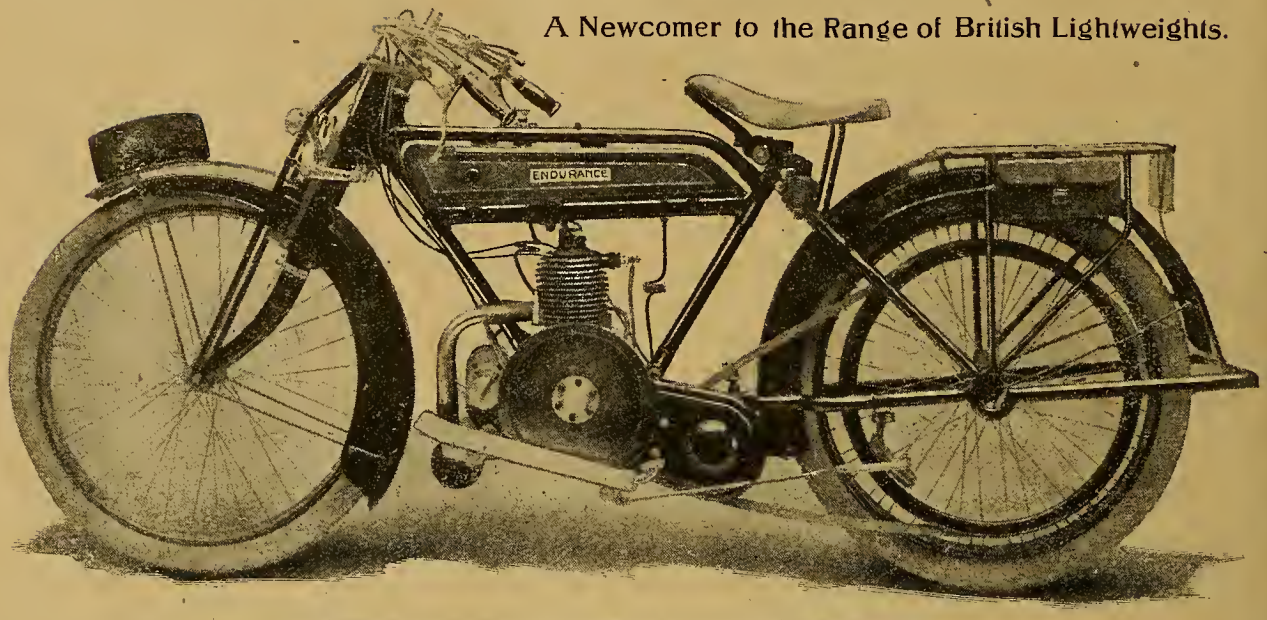
Even the compression space was checked and found correct, and we have reason to congratulate Messrs. Butterfield, Ltd., not only on the performance of their standard machine, but also on the accuracy of the workmanship and the undoubted excellence of material in their engines.



Showing where deposit occurred most thickly on the piston and rings.

The Endurance Motor Cycle.

A Newcomer to the Range of British Lightweights.



The Endurance two-stroke, which is fitted with the new Arden engine of 269 c.c.

THE Endurance Cycle Co. is one of the oldest-established firms in the cycle and motor cycle trade, but since the bulk of its products goes overseas, it is not so well known in the home country as it deserves to be. For 1920, however, a certain proportion of the output will be sold in this country, among which will be included the Endurance motor cycle. Following conventional lines, the Endurance lightweight is fitted with a two-stroke power unit of a new make—the Arden—which is described below.

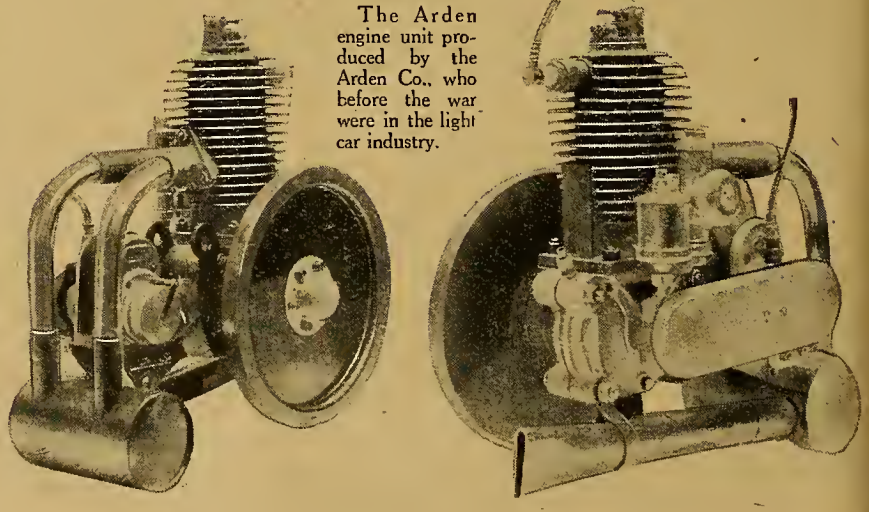
The Endurance is well made and finished, and is fitted with an Albion gear box, Saxon, Druid, or Brampton forks, Dunlop tyres and belt—in fact, all the equipment is of the highest quality, no attempt being made to produce the machine to a price. Aluminium footboards and a neat chain guard also are fitted, and altogether the little mount is one which should be a welcome addition to the lightweight market. The makers' address is Endurance Works, Sheepcote Street, Birmingham.

The Arden Two-stroke Engine Unit.

A New Proprietary Engine Unit made by an ex-Light Car Firm.

TWO-STROKE engine units have been in such demand during the present year that it is not surprising that they are receiving the attention of engineering firms who, on the signing of the Armistice, had to decide upon a new peace programme. The Arden Motor Co., of Berkswell, who before the war made the Arden light car, were one of those firms who appreciated the fact that, while a strong demand existed for certain types of engine, it would be folly to introduce an entirely new design necessitating long experimenting. For this reason the Arden two-stroke engine follows well known and accepted practice. Having both bore and stroke of 70 mm., the engine embodies roller bearings throughout, and is well made. In order to avoid a sharp bend in the exhaust pipe or a special duplex frame tube, twin exhaust pipes are fitted, which give the engine a more symmetrical appearance than is the case when a single pipe is fitted on one side of the front down tube of the frame. A C.A.V. magneto, Amac carburetter, steel barrel silencer, and engine plates form part of the equipment. The Arden Co. are in a position to produce large quantities of this engine, which is standardised throughout. The sole selling agents are Messrs. C. B. Harrison and Co., Sheepcote Street, Birmingham. who have an extensive business as frame manufacturers to the trade, at home and abroad.

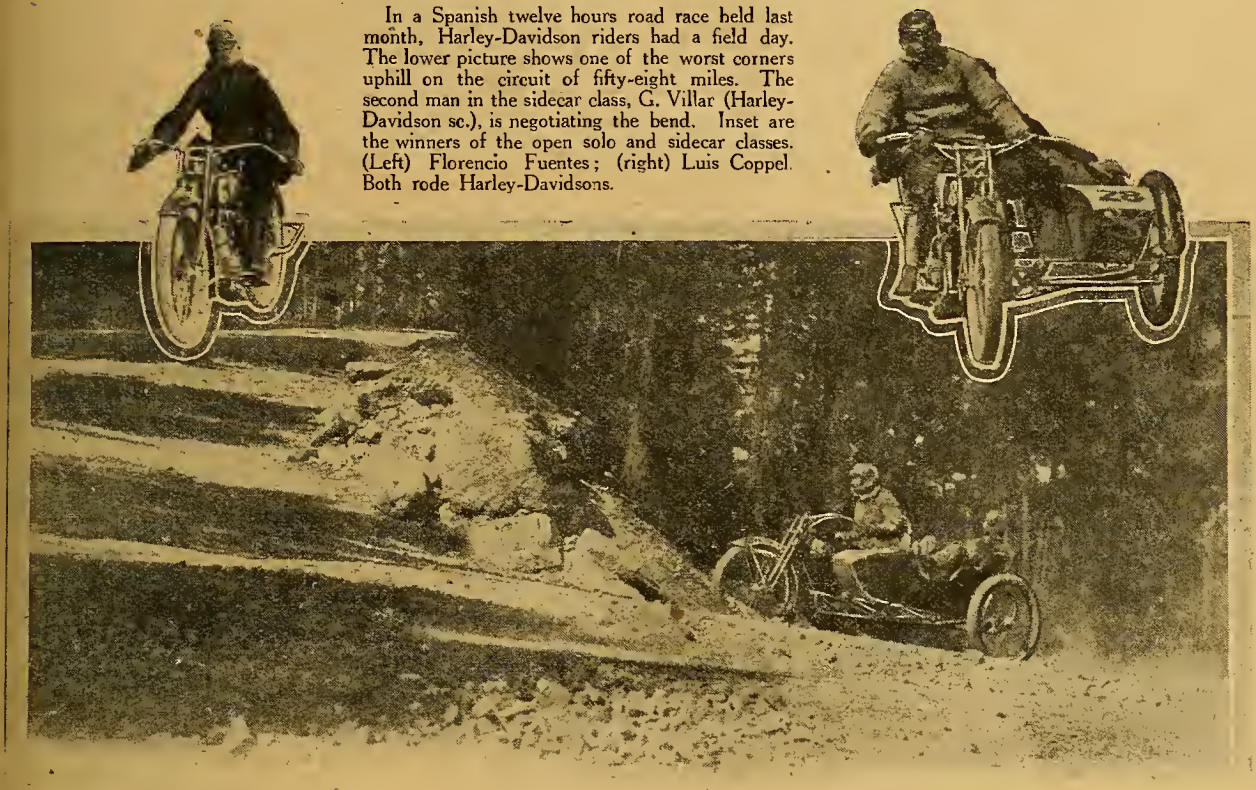
A NEAT TWO-STROKE ON STANDARD LINES.



The Arden engine unit produced by the Arden Co., who before the war were in the light car industry.

A Spanish Twelve Hours Road Race.

Success of American Machines in an Event Totalling 1,465 Miles.



In a Spanish twelve hours road race held last month, Harley-Davidson riders had a field day. The lower picture shows one of the worst corners uphill on the circuit of fifty-eight miles. The second man in the sidecar class, G. Villar (Harley-Davidson sc.), is negotiating the bend. Inset are the winners of the open solo and sidecar classes. (Left) Florencio Fuentes; (right) Luis Coppel. Both rode Harley-Davidsons.

ON the 14th of last month an important twelve hours race took place in Spain on a circuit of over fifty-eight miles, which was covered eight times by the winners, making their distance about 465 miles. The event was held near Madrid, and was remarkable for the consistent running and excellent performances of riders of the Harley-Davidson machines, both solo and sidecar models. There were five of these machines in the open solo class, and they finished first, second, third, fourth, and ninth. Two Indians occupied the fifth and seventh places, and a James the sixth position.

In the open sidecar class there were six Harleys, and they occupied the first five places, the remaining machine being eighth. Two Indians were sixth and seventh.
